PREFACE

This third *World Survey of Education* has been produced in conformity with a resolution (1.22) adopted by the General Conference of Unesco at its tenth session (Paris, November-December 1958), authorizing the Director-General to maintain an Education Clearing House for the exchange of information related to the educational needs of Member States.

The purpose and plan of the book, and its relationship to past and future volumes in the series, are treated in the Introduction. It will therefore suffice at this point to call attention to the fact that nearly all the 200 national studies which make up the greater part of the publication were supplied by educational authorities in the Member States of Unesco. The contribution of the Unesco Secretariat has consisted in planning and co-ordinating the various aspects of the work, and in providing the supplementary material needed for a publication that is world-wide in scope and directed to an international audience. Care has been taken to indicate the authorship or source of the different sections of the book, and when they were prepared. By glancing at these credit lines the reader will realize the extent to which the production of this volume has depended on planned international collaboration, and on the industry, research and goodwill of a great number of people all over the globe.

One innovation needs to be pointed out. In response to a demand expressed by many readers of the earlier volumes of the *World Survey of Education*, the preliminary section, in which the Secretariat attempts a world view and a summing-up of the current trends and problems of education, has been considerably expanded. Whereas in the past such international chapters have been almost wholly concerned with the quantitative aspects of educational change, the present volume deals also at some length with developments in the organization and content of education. To prepare studies on the latter, the Director-General called on the services of Mr. George W. Parkyn, Director of the New Zealand Council for Educational Research. Mr. Parkyn's analysis appears as Chapters IV to VII, which should be read as a work of individual scholarship based on the official material of this *World Survey of Education* but not reflecting any official point of view.

Finally it should be emphasized that the information contained in this volume was received from the respective national or administering authorities before 31 May 1960. Accordingly the names, status and frontiers of the countries and territories shown are those which existed at that date. In some of the statistical tables it has been necessary to provide a purely geographical basis for the accompanying information. The designations employed and the presentation of the material do not imply the expression of any opinion whatsoever on the part of the Secretariat concerning the legal status of any country or territory or of its authorities, or concerning the delimitation of the frontiers of any country or territory.

STATISTICAL TABLES

The following symbols are common to all tables:

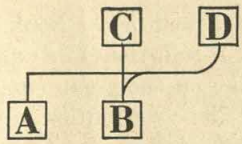
Data not available	. . .
Magnitude nil (or negligible)	—
Category not applicable	.
Provisional or estimated figure	*

Financial data are given in national currencies. The conversion rate in terms of U.S. dollars, valid for the years to which the tables refer, will be found in the general statistical information at the end of each national text.

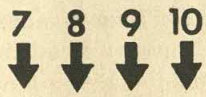
DIAGRAMS AND GLOSSARIES

School articulation diagrams, showing the relation of general and vocational secondary schools in a country to the national educational system as a whole, are fairly homogeneous throughout the book. The main elements are:

a class of one year's duration



unbroken ruled line for passage of pupils from one class to next higher class



symbol in line to indicate examination

The connexion between different school types is shown by a vertical line or by an horizontal line curving into vertical (thus: pupils from A can go to D but not to C; pupils from B can go to C or D).

An age scale appears at the top of each diagram, showing the approximate age of pupils enrolled in the appropriate class of each type of establishment.

Glossaries are provided, with a few exceptions, for the diagrams; they define the national terms according to principles referred to in the Introduction. The exceptions are diagrams in which the terms are given in English and for which no specific information has been available to qualify the generally accepted meanings of these terms. Similarly, even where an English language diagram is accompanied by a glossary, terms which may be considered as self-explanatory have been omitted.

CONTENTS

Introduction 10

INTRODUCTION

The purpose of this introduction is to make the book more serviceable to the reader by explaining in some detail what it is about, what were the goals that the Unesco Secretariat set out to attain, and what methods were employed to try and attain them. Indeed, something more than an apt title is needed to introduce the present volume. A World Survey of Education to which some two hundred different national authorities are invited to contribute, may well take the form of an encyclopaedia of 200 articles, unrelated to one another except by the very broad topic of 'Education', and still be a useful publication. In each volume of Unesco's *World Survey of Education* the compilers endeavour to go much further towards a unified and systematic presentation of the material, so as to facilitate the comparative study of educational organization and practices, and the derivation of generalizations which can serve as yardsticks or guide lines for all who are concerned with the expansion and improvement of educational services.

Let it be said, here and now, that any such comparisons or generalizations must be made and interpreted with extreme caution; and it would seem that no amount of systematic presentation or use of verbalistic or numerical conventions can sort the vast complexity of 200 school systems into neat little comparable packages. Yet a start has been made towards providing some kind of structure within which educational systems can be compared, and it can fairly be claimed, from reactions to the two preceding volumes in this series, that the results achieved, however modest, have encouraged Unesco to persevere along these lines, which are described below. Since in its general plan this third *World Survey of Education* very closely resembles its predecessors, readers of the earlier volumes may find little novelty in what follows. However, it would seem desirable to restate the principles and methodology of the book, not only so that this volume may be complete in itself but also because the plan, principles and methods have necessarily been adapted to the particular theme of secondary education.

In this present volume, then, an effort has been made to produce a work of reference which is both self-contained and part of a series. The long-term plan is to issue a full account of the educational systems of the world at three-yearly intervals. The first *World Survey of Education*, which was published in 1955, contained descriptive and statistical material on all aspects of the 'national school systems', from kindergarten to university including also informal adult education. Volume II was devoted more particularly to the primary schools of the world, but contained sufficient additional data to indicate the general context in which the primary school was situated. This third volume, following the pattern of Volume II, presents within the context of the educational system as a whole a somewhat detailed analysis of 'secondary education', a term which is here interpreted as covering all types of education—general, technical, vocational, teacher training or other—provided for young people between the ages of approximately 12 and 18.

To continue the series, a fourth volume will be issued in three years' time, to deal in similar detail with higher education. The cycle will then be completed and it will be necessary to decide whether it would be more useful to repeat the original pattern of four volumes—general, primary, secondary, higher—or whether some other formula is preferable.

While this approach gives a central theme to each volume, the method of treatment is broadly the same in each case. The idea of serial progress is contained in several elements which recur (and will recur) from volume to volume, duly brought up to date. The most obvious example is that of the summary table of school statistics, for all levels of education; the present volume contains the same tabulation as was used in the two previous volumes, but with more recent statistics. Similarly, accounts of the over-all organization of the school system are required in order to provide a background for the particular level of education treated in the volume; in the present case the diagram of school organization is the same as that used previously, but revised and corrected. Thus, as the series develops it should provide a continuous record of the movement of education. In other words, one may hope that the successive volumes of the *World Survey of Education* will occupy a useful place in the educational library, close to the companion series *International Yearbook of Education* (published jointly by the International Bureau of Education and Unesco); and that the arrival of a fresh volume will not give the impression that the previous volume has been superseded. *The World Survey of Education* will provide context and perspective for the events recorded in the annual reports of national authorities.

AIMS

The third *World Survey of Education* pursues a double aim: to give a world view of secondary education (as defined above) and to give a more detailed view of all types of schooling or instruction at this level in each country and territory of the world.

The former purpose is one which is closely related to Unesco's role as an international agency concerned with education. The Universal Declaration of Human Rights, adopted unanimously by the General Assembly of the United Nations at its third session on 10 December 1948, states in Article 26(1): 'Everyone has the right to education. Education shall be free, at least in the elementary and fundamental stages. Elementary education shall be compulsory. Technical and professional education shall be made generally available and higher education shall be equally accessible to all on the basis of merit'. Believing that the special needs of children justified a separate declaration, the United Nations General Assembly, on 20 November 1959, unanimously adopted and proclaimed a Declaration of the Rights of the Child, Principle 7 of which, after reiterating the right of every child to free elementary education, goes on to state: 'He shall be given an education which shall promote his general culture, and enable him, on a basis of equal opportunity, to develop his abilities, his individual judgement, and his sense of moral and social responsibility, and to become a useful member of society . . .'. But in the world of today half the children do not even receive the free elementary schooling which is declared to be the least of their educational rights, many of those who attend primary school have no opportunity for further education, and only a slender minority, on the world scale, reach university or institutions of advanced technical and professional training. Even in those countries whose children are able to pursue their studies to the full extent of their capacities and interests, the constant concern with reform of the school system, with revision of curricula, syllabuses and methods, with improvement of guidance services, etc., shows that the expansion and improvement of education are world issues whose importance is universally recognized. Confronted with so many problems the international and national agencies in the field of education have often found it extremely difficult to decide which will have prior claim on the limited resources in money and manpower. During the first decade after the second world war the major educational aims in the underdeveloped regions were the provision of basic primary schooling and the liquidation of adult illiteracy. More recently, the experience of the newly independent states has strengthened the view that, while there can be no relaxation of effort in other sectors, the development of secondary education must be given utmost priority. It is realized that secondary education is not only needed by those who will go on to university and become the nation's doctors, lawyers, engineers and higher administrators, but is also a minimum qualification for the equally indispensable but far more numerous group of the population who will fill the intermediate ranks in commerce, industry and administration and will teach in the primary schools.

Apart from the intentions and achievements of national authorities, one of the significant trends of the years since 1946 has been the expansion of international programmes of educational assistance. Within the United Nations framework the regular programme of Unesco and the Expanded Programme of Technical Assistance have contributed increasingly to the improvement of secondary education. More recently, the United Nations Special Fund has made available international aid for vocational and technical education and, to some extent, for the preparation of secondary school teachers.

While it is obvious that the extension of secondary schooling is essentially a matter of raising funds and spending them on the erection and furnishing of school buildings, the training of teachers and administrators, and the provision of textbooks and other learning and teaching materials, yet it is also clear that all this activity must be planned, and policies and regulations laid down. This is where the *World Survey of Education* has its own modest contribution to make. It represents the processes of fact-finding and generalization applied to the world as a whole, in order that international councils and the makers of national educational policies may be the better informed. How long should be the course of general education taken by all pupils before differentiation into specialized curricula? Should differentiated courses be provided in separate institutions or the same comprehensive type of school? If there is to be selection for secondary entrance, how can this be done justly and in the best interests of the pupil and the country? These are three examples of the many problems which are being faced by educators all over the world and not just those in the underdeveloped regions. This third *World Survey of Education* places before the policy makers the experience of other educational authorities and the present trends and practices.

The second aim of the book is to give a fairly detailed account of secondary schooling in every part of the world. In its simplest expression, this is a work set out for easy reference, giving as accurate and up-to-date information as possible on the chief aspects of secondary school systems. Anyone concerned professionally with secondary schools—as teacher, administrator or student—should find here something of use, relevant to his own experience, introducing him to the educators and educational experience of other countries. The teacher going abroad for study or vacation needs a short account of the school systems he may meet. The administrator working on a problem wants to see how his colleagues in countries with comparable problems are setting about solving them, and the student may find that the *World Survey of Education* enables him to use comparative methods by providing data for a wider than national framework.

It is somewhat artificial to distinguish in this way between 'international' and 'national' purposes. The two are interdependent: for only by compiling a full and accurate body of reference material—in this volume the several national chapters—is it possible to generalize about conditions in the world as a whole; and whatever the reasons that first cause a user to consult the book, the result, one may hope, will be a better and more sympathetic understanding of other school systems, and thus a better international understanding among the many educators this book is meant to serve.

PRINCIPLES OF THE WORK

The basic principles underlying the compilation of the third *World Survey of Education* were the same as those used in preparing the two previous volumes. They may be restated as follows:

1. The 'national school system' should be adopted as the unit for description; it will include a varying range of institutions and activities according to the historical and cultural traditions of each state and territory.
2. The survey, by definition, should be geographically comprehensive, so that every part of the world with a distinct school system is represented.
3. Political considerations should be taken into account in defining the territorial limits of individual educational systems.
4. Each national section should be self-contained and should explain the present pattern of secondary schooling within the framework of the educational system as a whole.
5. Each section should be kept brief—there is an essential minimum of information which is needed for an understanding of the school system.
6. Data should be accurate and recent.
7. Both descriptive and statistical material should be given in a uniform pattern to facilitate comparison.
8. Presentation should be planned for a multi-national public, for the 'foreign student'; this reinforces the need for standardization and for attention to terminology and graphic devices.

The decision to use the national school system as the unit for description in a volume on secondary education led to difficult terminological problems. As already mentioned, secondary education was defined for the purpose of this volume as the second stage of formal schooling, covering approximately the period of adolescence, and including all types of education provided at this level—general, technical, vocational (including apprenticeship training), teacher training (where entry is based on completion of primary or lower secondary studies), art and music education, etc. It was also meant to include evening and part-time courses of secondary standard, and informal education of the folk high school type for young people in this age-group. In applying the term 'secondary education' as so defined to the varying usages, in different languages, of some 200 school systems, three kinds of terminological problems are met. The first arises in cases where national usage distinguishes a primary from a secondary ladder so that 'upper primary schools' exist with differentiated curricula for children 12–16, alongside preparatory classes which form part of a 'secondary school'. Here, as far as possible, the present volume describes what corresponds to the primary level as 'primary' and the subsequent stage as 'secondary', at the risk of violating national usage. A related issue is found in countries with primary-intermediate-secondary school plans; in these cases, for various reasons—age of pupils, nature of the curriculum, etc.—the intermediate schools have been included in one or the other of the two broad classes. The second problem arises from the unitary or *école unique* systems, where a single all-age school is referred to nationally as a secondary school, and primary education is seen merely as the initial stage of the total process. In such cases the definition adopted for the present volume refers to the upper stage, although the actual division will vary from one country to another: e.g., some countries with 10- or 11-year schools have provided information on all grades above the fourth; others with similar unified ladders refer only to the top three grades. In this respect there may even be disparity between the descriptive and statistical reporting for the same country. The third problem concerns vocational and technical schools. Historically, vocational training for apprentices and technicians was nearly always provided in institutions which were administratively and organizationally distinct from the 'secondary' schools, which led to university, and from the upper primary or primary continuation or complementary schools, which gave general secondary education of a terminal nature. There are still many countries in which vocational and technical education comes wholly or partly under Ministries other than the Ministry of Education. But even in those which have long since brought all formal schooling under the Ministry of Education, and have transformed all public schools at secondary level into multilateral or comprehensive high schools, the traditional terminological distinction between secondary and technical may still persist, even although it no longer corresponds to anything more than an emphasis or bias in the optional subjects or courses offered. A much more serious difficulty, however, arises from the fact that many vocational or technical schools are at post-secondary level, in the sense that they are for pupils beyond the normal secondary leaving age or even require completion of general or vocational secondary studies as a condition for entry, but at the same time are obviously below university level. Here again there has been some variation in the reporting by Member States, although in general all vocational and technical education between the level of the primary school leaving certificate and the university schools of engineering technology, commerce, agriculture, etc., has been categorized as 'secondary'.

With the present world trend towards the postponement of vocational selection to a later and later stage in the educational process, it may well be necessary, before embarking on a second cycle of the *World Survey of Education*, to re-examine the concepts of 'primary', 'general secondary' and 'vocational secondary'; on the other hand, educationists will still have to provide for the differentiation of abilities, aptitudes, skills and interests which manifests itself so markedly in early adolescence, and will still have to provide for the diversified economic and social needs in skilled manpower.

GENERAL VIEW OF THE 'WORLD SURVEY OF EDUCATION'

The volume opens with several international studies. These are followed by some 200 national chapters which account for all political and territorial units with distinct school systems. An innovation in this third *World Survey of Education* is that the index is placed in the middle of the book instead of at the end; in view of the unwieldy size of the publication and the frequency with which the

index is likely to be consulted, this change should enable the book to be handled more easily.

The international material in this volume has been prepared by the Unesco Secretariat, with the help of Mr. George Parkyn, as pointed out in the Preface. It is based largely on the contents of the national chapters, but where other Unesco studies or national sources have been used, these are noted in passing.

As the contents table shows, the national entries are arranged alphabetically by sovereign country, the status of the world on 31 May 1960 being used as a guide. It follows that many recent political changes, mainly those which have taken place in Africa, will not be reflected, but this is unavoidable in view of the fact that the material was prepared in 1959–60 by the former administering authorities or at an earlier stage of political evolution than that which will have been reached by the time this book is issued. Non-self-governing territories and autonomous territories which did not have full international sovereignty by May 1960 are grouped after the States responsible for all or part of their administration; as far as possible an alphabetical order is followed, but sometimes (as with the United Kingdom) an additional geographical classification is introduced. In some cases, too, a broader synthesis has been adopted, as with the chapter on the Portuguese Overseas Provinces, where only the statistics of the eight territories are differentiated.

This arrangement is open to criticism. There may be value in placing Macao under the letter M instead of after Portugal. However, the present system seemed to be the best compromise between the need for easy reference and the conflicting need for avoiding repetition and achieving brevity.

The method used in preparing national material, and the relevant dates, are shown in the credit line at the end of each text. The sources for the statistical tables, which were prepared separately, are given in the brief statement which precedes them. For the texts a seven-page 'chapter guide' was drawn up by the Secretariat, indicating the main headings and sub-headings, supplying a check-list of topics which the authorities might wish to discuss under each of these headings, and offering some suggestions as to how the topics should be treated. This chapter guide was sent to all Unesco National Commissions. Where the latter undertook an original study this is denoted by the use of the formula 'Text prepared by . . .'; where the chapter submitted was rather a revision by national authorities of a text drafted by the Secretariat, the formula is 'Text revised by . . .'; and in the few cases where little or no contribution was received from the national authorities, and for countries which are not Member States of the United Nations Organization or any of its Specialized Agencies, the Unesco Secretariat is quoted as the originator, the texts following whatever official sources could be obtained.

When the chapter guides were sent out to National Commissions they were accompanied by copies of the school organization diagrams and glossaries published in *World Survey of Education: II—Primary Education*, the authorities being asked to return these with any changes or corrections that they wished to make.

For statistical tables a separate procedure was followed. An extensive blank questionnaire (ST/Q/37) was sent to all Member States of Unesco; the replies provided data for the main tables, but other tables were based on replies to previous more specialized Unesco questionnaires. In all cases tables were compiled by the Secretariat and checked wherever possible with published official statistics. To improve the standardization of material, the school-year 1957/58 has been used as a cut-off point. For a number of countries more recent data are available; but since the *World Survey of Education* has to cover all countries and since it will be published every three years, this arbitrary fixing of dates may be accepted as reasonable. One may note that for many of the large federal states official reports on education show a two to three year time-lag. In a survey presenting comparable data for all the school systems of the world, a time-lag of three to four years may not be considered excessive. The summary text preceding the tables was drawn up by the Secretariat.

INTERNATIONAL CHAPTERS

The 'international section' has been greatly expanded in comparison with generalized material published in the two previous volumes. It begins with three chapters analysing quantitative aspects of educational change. Chapter I, entitled 'World Survey of Education 1953–57', presents aggregate figures for the school systems of the world and tries to measure changes over the period in question. This study forms a sequal to the similar one in *World Survey of Education: II*, dealing with the years 1950–54. Chapter II is concerned with the relationship of the school-going population to the total population in the same age-group. This type of inquiry was begun in Chapter II of the last edition, which contained diagrams showing the 'demographic-educational structure' of 10 countries. As yet only a few countries are able to provide the data for diagrams of this type but their number is growing. The present volume contains diagrams for 13 school systems representing a much wider geographical and socio-economic spread than did those published in 1958. The third chapter is a world survey of secondary enrolment trends since 1930, and is therefore of special significance for the study of the central theme of the book.

Chapters IV to VII describe the qualitative changes in the organization and content of secondary education. Chapter IV is a general study, in historical perspective, of the major contemporary trends in education: the widening of opportunity, the unifying of primary and secondary schooling and the search for a balanced curriculum. In Chapters V, VI and VII each of these three trends is taken separately and examined in some detail.

Chapter VIII is a selected bibliography of journals on secondary education. As journals are not normally entered in the national chapter bibliographies, this international section is an indispensable part of the volume.

NATIONAL CHAPTERS: DESCRIPTIVE ELEMENTS

When the chapter guide, referred to above, was being drafted, decisions had to be made as to what each national account should contain, in order that the present pattern

of secondary schooling should be described adequately and sufficient information given on the educational system as a whole for the reader to see how secondary education fitted into the general structure. The main headings arrived at were as follows:

The educational system. An introductory section describing general arrangements for the provision of education at all levels—constitutional or other basic legal instruments governing the school system, the ethnic, linguistic, social, religious and other factors affecting the provision of education, the role of public and private authorities and finally the whole educational ladder, either shown diagrammatically or described in a brief paragraph.

The development of secondary education. Moving from generalities to the central theme of the volume, this section traces the main historical events, particularly since 1900, which have characterized the emergence of secondary education, in the broad sense of the term. The national chapters here vary a great deal in range and scope and in some it has been found necessary to retain separate sections for general and vocational education. The legal basis of secondary education, if distinct from the general legislation, is treated next, sometimes in association with the historical section. Then comes information on the administration of secondary education covering in turn: how plans and policies are laid down; how control passes from the central education authority to the headmasters of secondary schools; supervision and inspection; finance; buildings and equipment; school welfare services.

Types of secondary education. Another important section, in which secondary education is described from the standpoint of the pupil and teacher rather than from that of the Ministry of Education. It begins with a general review of the various possibilities open to the primary school leaver, what help he can get in choosing a post-primary course, and what prospects are offered to those who complete their secondary studies. It also gives information on the organization of the school year.

The section then deals in turn with each of the principal types of secondary education: general secondary, vocational and technical, teacher training (where it exists at this level), etc., describing aims, length of course, curricula, methods, examinations, teachers for each type. It also includes information on out-of-class activities and their important role in the building of character, personality and a sense of responsibility.

Trends and problems. A summing up of the main lines of development.

Bibliography. An effort to provide the reader with relevant, recent (mainly since 1955) sources. As country bibliographies do not repeat the basic sources of statistical information given in the first *World Survey of Education*, the reader is referred to the latter work to supplement any titles that may be quoted among the sources of the statistical data in the present volume. In structure, bibliographies contain three elements: basic works relating to secondary education (laws and regulations, reports, etc.); further reading in the language of the country; and further reading in foreign languages (here the secondary education criterion is applied somewhat loosely). As mentioned earlier, the country bibliographies are complemented by a list of journals (Chapter VIII).

DIAGRAMS AND GLOSSARIES

The school organization diagrams are a recurring element in all volumes of the *World Survey of Education* and provide an interesting pictorial record of the effects of school reform on the educational ladder. The procedure by which they are kept up to date has already been mentioned. Another important feature of these diagrams is that most of them give the names of the schools in the national or official language, thus affording the reader a means of seeking from national sources further information on schools which may have been referred to in the text only by a translated version of their title. These original terms are accompanied by a glossary of English explanations.

This national glossary represents an attempt to arrive at an adequate defining vocabulary in English. The general terms have to be reduced to a minimum; they must be susceptible of definition in unambiguous words; and while not rooted in the usage of particular countries they must be clearly understandable by all English readers. The tentative list used is as follows:

Pre-primary school. An institution for the education of young children below the age of formal schooling, emphasis being placed on social and physical development rather than intellectual training. The term as used throughout this book excludes institutions developed to care for, but not educate, the children of working parents.

Primary school. An institution providing for the first stage of formal education, beginning approximately between the ages of 5 and 7 and ending approximately with adolescence.

Secondary school. A school providing for the second stage of formal education, covering approximately the period of adolescence (12 to 18 years), and catering to a greater degree than the primary school for the diverse interests, capacities and aptitudes of the pupils with a view to preparing them to take their place in adult society.

General secondary school. A secondary school where curriculum is basically a combination of academic subjects: languages and literature, mathematics, pure science, history, geography, art and music, taught for the sake of the intellectual and cultural development of the pupils and not as vocational training.

Vocational secondary school. A secondary school with a curriculum including both subjects intending to fit pupils for an occupation or career and subjects of a general cultural value; the course or courses usually lead to further vocational training at a higher level.

Vocational training school. A school whose function is to teach occupational skills and only such other subjects as bear on the understanding and mastery of these skills; the course or courses are usually terminal.

Teacher training school. An institution at secondary school level for training primary school teachers and offering a course comprising both general and professional education, leading to certification.

Teacher training college. An institution training primary or secondary teachers with a course based on upper secondary studies and offering mainly professional but also some general education, leading to certification.

Institute of education. A degree-granting college for research and advanced training in education.

College. An institution giving specialized education at post-secondary level.

University. A degree-granting institution of higher education, following on from upper secondary studies, and providing for advanced study and research in a number of branches of learning, organized in faculties, institutes or colleges.

STATISTICAL TABLES

Two statistical tables recur in all volumes of the *World Survey of Education* and are an important element of continuity in the series. These are the summary table of school statistics and the table on educational finance. The summary table gives a comprehensive view of schools, teachers and pupils for each level of education and type of school. The table in the present volume covers a five-year period, from 1953 to 1957 inclusive, so that it is possible to examine changes within a country and also to make comparisons between countries for a given year. The table on educational finance has been expanded, compared with financial data given in previous editions, the standard pattern comprising three sub-tables showing respectively the various sources of educational income, the distribution by purpose (administration, instruction, etc.) and the amount of public money expended annually on the various levels and types of education.

The statistical section is completed by two tables specifically referring to secondary education. The trend table shows, in its complete form, the development of general, vocational and teacher education at secondary level since 1930, the known or estimated population of secondary school age at five-yearly intervals, and the corresponding ratio of enrolments to the general population in this age-group. The resulting figure, called as a matter of convenience the secondary enrolment ratio, is an interesting indication of change within a given country but should be used only with extreme caution, indeed hardly ever, to make international comparisons. National practices vary considerably in the reporting of secondary enrolments, a complicating factor being the divergent national views as to what is meant by 'secondary'. The second table relating specially to secondary education gives examination results for the main certificates awarded on completion of the stages and types of secondary education. Here again the table is more valuable as a national indicator than as a basis for international comparison. As a step towards the latter goal the Secretariat investigated the possibility of allotting each examination a code symbol showing the type and length of course, e.g. GLU/12 might have been used to indicate that the examination in question was for general secondary leavers, gave access to university, and required a minimum of 12 years' formal schooling. With more research it may be possible to devise a general system along these lines.

A remark may be made about discrepancies in figures. To take only one element reported on—enrolment in schools and universities—totals may fluctuate throughout the year, and in many countries this fluctuation is marked and may account for variations between figures reported by different sources. Some discrepancies between the text and tables (when derived from separate sources) are bound to occur in a volume of this size; similarly, differences may be noted between this volume and the previous ones, in which case however the data given in this volume are likely to be the later and therefore corrected figures.

STATISTICAL SUMMARIES

Following the practice begun in *World Survey of Education: II—Primary Education*, the statistical tables are accompanied by a short text summarizing the main trends and giving whatever additional information may be necessary to the full understanding of the data. In some cases a paragraph is used to replace what would have been a very short and incomplete table.

CONCLUSION

Much of the justification for publishing the *World Survey of Education* has been expressed in terms of practical utility. The book is conceived as a tool for action on the part of administrators and policy makers. But it is intended also for students of comparative education, whose work is growing in importance as international programmes in education, both bilateral and multilateral, tend to increase.

During the past five years comparative education has gained growing support, if one is to judge by the place it is coming to occupy in the curriculum of institutes of education and teachers' colleges. There has been a corresponding increase in the literature. Much of this can still be qualified as 'foreign education', that is, accounts of, or reflections on, the school systems of countries other than the author's. Such studies are necessary for comparative education but do not get to the heart of the matter—comparison. However, recent developments show that the question of the methodology of comparison is receiving more attention. This implies pressing into the service of international education the tried skills and experience of a wide range of social sciences. Educational psychologists have started on the problem of devising an international means for measuring the results of schooling; specialists in social psychology and child development are trying to set up studies of a cross-cultural character to discover essential similarities and differences among children of different cultures; and a growing number of economists are turning their attention to a study of the costs and the productivity of education. More examples could be given, but the point is clear that the term comparative education should now be extended to cover a broad area of work that goes far beyond the limits of the history and philosophy of education. If such an interpretation is given, comparative education may become an essential instrument for policy-making and for planning the development of education in the context of social and economic progress.

It should be noted that the *World Survey of Education* and the *International Yearbook of Education* contribute to this progressive development of comparative education. The massing of facts in a fairly comparable form makes available to the student much of his raw material. The existence of these reference works lessens the need for

time-consuming studies of foreign education. At the same time, the student of comparative education should be challenged by the very defects and the unsolved problems of the international compilations. How to improve comparability of data and how to effect valid comparisons between different school systems—a host of questions arise under these two headings.

CHAPTER I

WORLD SURVEY OF EDUCATION 1953—57

As in the preceding volumes of the World Survey of Education, *the opening chapter gives a summary and largely statistical account of the general movement of education during the period under review. One innovation here is the attempt to present summary tables not only for the world as a whole, but also broken down into the main geographical regions. Following the world survey proper, a regional survey is presented for tropical Africa—in part as an example, in part because of the current interest shown in African education by international circles.*

In the school year 1957/58, it is estimated that 341 million children and adolescents were enrolled in schools around the world, representing 12.4 per cent, or nearly one-eighth, of the estimated total world population at mid-year 1957. This proportion is merely a world average, and does not show the marked differences in the educational development of the various areas, some idea of which may be obtained by examining the figures in Table 1 (page 18). In the latter, data for the Union of Soviet Socialist Republics are given separately and are therefore not included in the figures for Europe and Asia.

For the continents and regions, the proportion of the total population enrolled in schools ranged from 23.5 per cent in Northern America to only 6.8 per cent in Middle and Southern Africa. The proportion for Oceania as a whole was 19.4 per cent; for the Americas, 18.3 per cent; U.S.S.R., about 16 per cent; Europe, 15.5 per cent; Asia, 10.3 per cent; Africa, 7.2 per cent.

When compared with figures for 1953/54, those for 1957/58 show a general advance. For the world as a whole, the school-going proportion of the total population increased from 11.6 per cent in 1953 to 12.4 per cent in 1957, the result of a 14.1 per cent increase in total enrolment (from 298 million in 1953 to 341 million in 1957), as against a 7 per cent increase in total population (2,575 million in 1953 to 2,756 million in 1957). The African continent, starting from a relatively low base, showed the highest rate of growth: enrolment increased by 47.9 per cent, from 11.3 million in 1953 to 16.8 million in 1957, and the proportion of the population in school from 5.3 per cent to 7.2 per cent. Oceania and the American continent registered increases of 22.8 and 21.6 per cent respectively in their total enrolment, so that their school-going population, expressed as a proportion of total population, rose from 17.4 per cent to 19.4 per cent and from 16.3 per cent to 18.3 per cent respectively. The development in Asia paralleled the world average, with a 14.9 per cent increase in total enrolment, resulting in an increase from 9.6 per cent to 10.3 per cent of their total population enrolled in schools. The continent of Europe showed a moderate increase of 8.8 per cent in total enrolment, raising the proportion of school-going population from 14.8 per cent to 15.5 per cent. The figures for the U.S.S.R. show a slight decrease, both in total enrolment and in the proportion of school-going population; this is due mainly to a substantial decrease in reported enrolment at the second level, which will be discussed further in the next section of this chapter.

Detailed figures on annual enrolment, by level of education and type of school, for each individual country during the period 1953–57 will be found in the country chapters of this volume.

ENROLMENT BY LEVEL OF EDUCATION

For the first time since the adoption by the General Conference of Unesco, in 1958, of the recommendation concerning the international standardization of educational statistics,[1] an attempt will be made to present a world summary of school enrolment by continents and regions and by level of education. For better comparability, this summary omits all figures relating to education preceding the first level (pre-primary education), as well as other types of education not classifiable by level (notably figures relating to special education, and of various types of adult education). Nevertheless, the presentation of enrolment data according to the three principal levels does involve certain arbitrary choices regarding the classification of different types of schools. For example higher primary, intermediate or middle schools have generally been included under the second level of education; vocational and teacher training schools are for the most part included under the second level, except for those technical schools and teacher training colleges requiring, as a condition of

1. See Unesco, *Records of the General Conference, Tenth Session, Paris, 1958: Resolutions*, pp. 93–6.

TABLE 1. Estimated school enrolment by level of education: world, continents and regions

1. The world regions given in this table are constituted as follows:

Northern Africa: Spanish West Africa, Spanish possessions in North Africa, Morocco, Algeria, Tunisia, Libya, United Arab Republic (Region of Egypt).
Middle and Southern Africa: the remainder of Africa.
Northern America: Alaska, Canada, Greenland, St. Pierre and Miquelon, Bermuda, United States of America.
Middle America: the remainder of North America including the Caribbean.
South America: the entire continent.
South-West Asia: Turkey, Iran, Iraq, United Arab Republic (Region of Syria), Lebanon, Israel, Jordan, Cyprus, the Arabian Peninsula.
South Central Asia: Afghanistan, Pakistan, India, Nepal, Bhutan, Ceylon, Maldive Islands.
South-East Asia: Burma, Thailand, Indochina, Malayan Peninsula, Philippines, Indonesia and other islands south-east of the mainland.
East Asia; China, Japan and the remainder of Asia, except the Asian part of the Union of Soviet Socialist Republics.
Northern and Western Europe: Finland, Sweden, Norway, Denmark, Iceland, Ireland, United Kingdom, Netherlands, Belgium, Luxembourg, France, Monaco.
Central Europe: Germany, Switzerland, Liechtenstein, Austria, Poland, Czechoslovakia, Hungary.
Southern Europe: the remainder of Europe, except the European part of Turkey.
Australia and New Zealand: Australia, New Zealand.
Pacific Islands: the remainder of Oceania.
U.S.S.R. Union of Soviet Socialist Republics.

2. Unofficial estimate.

admission, the completion of education at the second level; under the third level are included all universities and other institutions of higher education, as well as technical, teacher training and other types of schools above the level of secondary education.

With the three levels of education so defined, and the above qualifications in mind, it is estimated that during the school year 1957/58 over 76 per cent of the total world enrolment was at the first level, nearly 21 per cent at the second level, and about 3 per cent at the third level. These proportions vary among the different continents and regions, as shown in Table 2 (page 19). Thus in Africa as a whole, enrolment at the first level accounted for over 90 per cent of the total enrolment, with less than 9 per cent at the second level, and less than 1 per cent at the third level. At the other extreme, figures for the U.S.S.R. show only 52 per cent of the total enrolment at the first level, nearly 42 per cent at the second level, and over 6 per cent at the third level.[1] The proportion of total enrolment represented by the first level of education was about 82 per cent for Asia, about 77 per cent for the Americas, 76 per cent for Oceania, and less than 72 per cent for Europe. Education

1. During the period to which these statistics refer the educational system in the U.S.S.R. provided for a 4-year primary school, a 7-year school, and a 10-year (in some cases 11-year) secondary school, besides various types of vocational schools and institutions of higher education. The proportions given here are based on counting only the first four grades of the 4-year, 7-year and 10-year (or 11-year) schools in the first level of education, and all the remaining grades of such schools in the second level of education, together with vocational schools. If the first seven grades were classified at the first level (as was done in *World Survey of Education*, II—*Primary Education*), then the respective proportions of enrolment by level for 1957 would be 74.3 per cent at the first level, 19.3 per cent at the second level, 6.4 per cent at the third level. Similarly, for 1953, the respective proportions would be 76.9, 18.5 and 4.7 per cent.

TABLE 2. Percentage of estimated school enrolment at each level of education: world, continents and regions

Continent and region[1]	Enrolment by level 1953/54			Enrolment by level 1957/58		
	First	Second	Third	First	Second	Third
World total	**75.4**	**22.1**	**2.5**	**76.3**	**20.8**	**2.9**
Africa	89.1	10.1	0.8	90.7	8.5	0.8
Northern Africa	76.6	21.2	2.2	82.4	15.5	2.1
Middle and Southern Africa	93.7	6.0	0.3	93.6	6.1	0.3
America	78.3	17.0	4.7	76.8	18.0	5.2
Northern America	73.0	20.8	6.2	71.1	22.0	6.9
Middle America	91.7	6.5	1.8	91.0	7.2	1.8
South America	86.2	11.8	2.0	84.8	13.1	2.1
Asia (excl. U.S.S.R.)	83.1	15.6	1.3	81.6	16.8	1.6

Oceania	77.5	20.2	2.3	76.1	21.5	2.4
Australia and New Zealand	75.7	21.6	2.7	73.6	23.7	2.7
Pacific Islands	89.0	10.8	0.2	92.4	7.4	0.2
U.S.S.R.	36.4	58.9	4.7	52.1	41.5	6.4

1. For the composition of these regions, see footnote to Table 1.

at the second level enrolled 26 per cent of all pupils in Europe, 22 per cent in Oceania, 18 per cent in the Americas, and 17 per cent in Asia. Education at the third level accounted for over 5 per cent of the total enrolment in the Americas, about 2.5 per cent in Europe and in Oceania, and less than 2 per cent for Asia.

Table 2 also shows the changes in the distribution of total enrolment by level which occurred between 1953 and 1957. For the world as a whole, the proportion of total enrolment at the first level increased from 75.4 per cent to 76.3 per cent during this period. This is due to the fact, as shown in Table 1, that total enrolment at the first level had increased at a more rapid rate (15.8 per cent) than total enrolment at the second level (7.5 per cent). Similarly, enrolment at the third level increased by 34 per cent between 1953 and 1957, hence accounting for 2.9 per cent of total enrolment in 1957 as compared with 2.5 per cent at the beginning of the period.

It may be noted that for the continent of Africa as a whole, where total enrolment increased by nearly 48 per cent between 1953 and 1957, the growth of enrolment at the first level alone was more than 50 per cent. Therefore the proportion of first level enrolment to total enrolment grew from 89.1 per cent to 90.7 per cent. Similarly, in the Pacific Islands region of Oceania, where total enrolment increased by 27.0 per cent, the growth in first level enrolment was about 32 per cent.

Among the regions shown in Tables 1 and 2, relatively more rapid growth in education at the first level is noted for Northern Africa, the Pacific Islands, and the U.S.S.R. Relatively higher rates of increase at the third level of education are noted for the U.S.S.R., Northern America, and all the regions of Asia and Europe. As regards the second level of education, higher rates of increase are seen for every region except Northern Africa, the Pacific Islands, and the U.S.S.R.

The situation with regard to the U.S.S.R. needs a word of explanation. Between 1953 and 1957, total enrolment at the first level of education increased by nearly 5 million, while enrolment at the second level decreased by more than 6 million. Although there was an increase of over half a million in the enrolment at the third level, the resulting total enrolment at all levels in 1957 thus fell short of the total enrolment in 1953, so that when enrolment figures are related to the total estimated population for 1953 and 1957, there appears to be a net decrease from 17.3 per cent in 1953 to 16.0 per cent in 1957. This is explained by the fact that the effects of the second world war period, which had previously retarded the growth of primary education enrolment, have now reached the generation of children and youth ready to receive secondary education.[1]

ENROLMENT AT THE FIRST LEVEL OF EDUCATION

According to the Unesco recommendation already referred to, 'education at the first level' is that 'of which the main function is to provide basic instruction in the tools of learning'. At this level therefore are included various types of elementary schools, primary schools, basic schools, etc. providing for the instruction of children from the age of 5, 6 or 7 years until they reach the period of adolescence.

1. According to official figures published by the Central Statistical Board of the U.S.S.R., the total number of pupils enrolled in all primary, 7-year and secondary schools of general education reached an all-time high level of 34.5 million in 1940/41, dropped to a low level of 26.0 million in 1945/46, increased gradually up to 33.2 million in 1950/51, decreased again to 28.1 million in 1955/56, and rose again to 28.6 million in 1957/58 and 29.4 million in 1958/59. These figures do not include pupils of 'auxiliary schools', 'schools for over-age pupils' and 'schools for children with physical defects'. They also exclude 'technical and other special secondary educational establishments'. A distribution of pupil enrolment by grade levels shows the following fluctuations between 1940 and 1958:

Year	Number of pupils (000's), by grade		
	1–4	5–7	8–10 (11)
1940/41	21 375	10 767	2 368
1945/46	19 858	5 175	975

1. For the composition of these regions, see footnote to Table 1.

The length of schooling at this level may vary from 4 years to 8 or 9 years, although in some countries there exist incomplete primary schools which provide only 2 or 3 years' instruction. Enrolment at this level of education is obligatory in many countries, but entirely voluntary in others; some countries have passed legislation requiring compulsory school attendance but the law is nevertheless not enforced or not enforceable, owing to shortage of schools and teachers, or is modified by various exemptions tending to reduce the actual number of children enrolled.

The size of the total pupil enrolment at the first level of education depends partly on the size of the child population in the appropriate age range, and partly on the duration of schooling provided and on the length of time during which each child remains in school. Thus, for example, where there are a million children aged 5 to 14 years inclusive (range of 10 years), and the public and private authorities provide schools of six years' duration, if every child remains in school for the full six-year period, one may expect the total enrolment to be in the neighbourhood of 600,000, either counted at any given time or averaged over a period of time. If the majority of the children remain in school less than six years, then the total enrolment would be much less than 600,000. On the other hand, if all the children go to school, and some remain longer than six years, then the enrolment could exceed 600,000. Similarly, the total enrolment in a primary school system of eight years' duration may vary around 80 per cent of the total number of children aged 5–14 years inclusive.

For purposes of international comparison, the child population 5–14 years old has been taken as the base; when the total enrolment at the first level of education is divided by the number of children in this age-group and the result multiplied by 100, a percentage ratio is obtained which in the previous volume was called the 'primary enrolment ratio'.[1] Because of national and local differences in the school system (length of primary course, whether or not intermediate schools are counted as primary, etc.) and in the age composition of the population, the primary enrolment ratio will fall short of 100, come close to 100, or even exceed 100, according to circumstances. In fact, with six to eight years as the normal length of primary schooling in the majority of countries, we may consider a primary enrolment ratio of 60 or more as signifying a satisfactory stage of development at the first level of education. A ratio between 40 and 60 would indicate a transitional stage of development, while a ratio less than 40 would mean either that children are not attending school in sufficient numbers, or that they are not continuing long enough in their school attendance, or both.

With these words of explanation, we may now proceed to examine Table 3 above, which shows a distribution of 116 countries, for which comparable data are available, according to their primary enrolment ratios for the period

1. A detailed explanation of the methods of computing and using the primary enrolment ratio in measuring progress of primary education is contained in *World Survey of Education:* II—*Primary Education*, Chapter III.

1950–54 and around 1957. It may be noted that among these countries there was a general improvement in primary enrolment ratios. The number of countries with ratios of 60 and over increased from 49 to 61 over this period; the group with ratios between 40 and 60 counted four fewer countries in 1957 than in the earlier period, while only 35 out of 43 countries remained in the category with ratios less than 40.

The majority of countries in the 'less than 40' category are found in Africa—four in Northern Africa and sixteen in Middle and Southern Africa. Even here, four countries in Middle and Southern Africa had moved out of this category before 1957. In Asia, ten countries are still in this group—six in South-West Asia, one in South-Central Asia, and three in South-East Asia. In the last-named region, two countries moved to a higher category between 1950–54 and 1957. The other five countries in this category are found in Middle and South America, where the number of low enrolment countries has also been reduced by two since 1950–54.

In the middle category—with primary enrolment ratios '40–59'—the reduction of four countries is the result of five additions (four in Middle and South Africa; one in South-East Asia) and nine subtractions (two each in Middle America, South America and Southern Europe; three in East Asia). Finally, the category '60 and over' gained from the addition of twelve countries (three each in Middle America, South America and East Asia; two in Southern Europe; one in South-East Asia).

It should be recalled that in the above analysis no account is taken of the number of children enrolled in 'education preceding the first level' (nursery schools, kindergartens, etc.), nor of those enrolled in 'special education' (for physically and mentally handicapped children). The numbers involved in the latter are too small to have an effect on the primary enrolment ratio. The enrolment of nursery schools, kindergartens, etc., does not usually reach appreciable size until after the full development of primary education proper. For these reasons, their omission is considered not to have any significant effect on the computation of primary enrolment ratios for international comparisons.

However, there is one particular factor which has a distinct relationship to the size of the primary enrolment ratio, namely, the percentage of girls in the total primary school enrolment. A country cannot have a high enrolment ratio unless a fairly high proportion of girls are included in the total enrolment, and an increasing percentage of girls enrolled usually accompanies a rising enrolment ratio. A proportion of 46 per cent or more girls in primary school enrolment may be regarded as satisfactory. Table 4 below, covering 97 countries for the periods around 1953 and 1957, shows that the number of countries with a girls' enrolment of 46 per cent or more increased from 59 to 62. The improvement resulted from the promotion to this category of two countries where the primary enrolment ratio was 60 and over, and one country where it was between 40 and 60. The situation in countries with primary enrolment ratios less than 40 remained unchanged.

Of the 24 countries with primary enrolment ratios less than 40, and having less than 46 per cent girls in their primary school enrolment, 5 are found in Northern Africa, 12 in Middle and Southern Africa, 1 in Middle America and 6 in Asia.

TABLE 4. Distribution of 97 countries by primary enrolment ratio and percentage of girls in total primary school enrolment, around 1953 and 1957

Primary enrolment ratio	Number of countries by percentage of girls in primary school enrolment			
	Around 1953		Around 1957	
	46 per cent or more	Less than 46 per cent	46 per cent or more	Less than 46 per cent
60 and over	48	5	50	3
40–59	7	9	8	8
Less than 40	4	24	4	24
Total number of countries	59	38	62	35

TABLE 5. Distribution of 94 countries by primary enrolment ratio and pupil-teacher ratio in primary schools

Primary enrolment ratio	Number of countries by pupil-teacher ratio			
	Around 1953		Around 1957	
	Less than 34	34 or more	Less than 34	34 or more
60 and over	28	19	27	20
40–59	9	9	8	10
Less than 40	17	12	12	17
Total number of countries	54	40	47	47

Another factor associated with increased enrolment in primary schools is the number of teachers in service as related to the number of pupils enrolled. This measure is expressed as the average pupil-teacher ratio. There seems to be a tendency for more countries to have a higher pupil-teacher ratio in 1957 than before. Table 5 above shows the distribution of 94 countries by primary enrolment ratios and pupil-teacher ratios for the periods around 1953 and 1957. Whereas around 1953 the median pupil-teacher ratio for these countries was 32.5, it had increased to 34 by 1957, owing to the fact that seven countries (including five with primary enrolment ratios less than 40) had increased their average number of pupils per teacher. It must be borne in mind that a median pupil-teacher ratio of 34 for the 94 countries covered in this table signifies that half of these countries had pupil-teacher ratios of 34 or higher—in many instances much higher than 34. Even in those countries with a national average of less than 34 pupils per teacher, there would be many schools and localities where the actual size of classes was as high as 50, 60 or more.[1]

1. For example, in the Netherlands, 1957, the average class size in primary schools (excluding 'continued primary schools and sections') was found to be 35.4 pupils, but the frequency distribution of classes by size showed a group of 1,032 classes, enrolling 53,515 pupils, where the number of pupils per class was 50 or more. (Centraal Bureau voor de Statistiek, *Statistiek van het gewoon- en voortgezet gewoon lager onderwijs 1953–1957*, p. 38–9.)

Nevertheless, in view of the fact that between 1953 and 1957, total world enrolment of pupils in primary schools had increased by 35.5 millions, it is evident that more than a million additional teachers were required merely to maintain an average pupil-teacher ratio of 34 or 35. Hence one of the urgent needs for those countries where primary education is being rapidly expanded is to find additional qualified teachers in sufficient numbers to prevent the growth of over-sized classes and to ensure the best conditions of class instruction.

ENROLMENT AT THE SECOND LEVEL OF EDUCATION

The 'second level of education', according to the Unesco recommendation, is understood to mean that which is 'based upon at least four years previous instruction at the first level, and providing general or specialized instruction, or both (e.g., at middle school, secondary school, high school, vocational school, teacher training school at this level)'. The data presented in this volume relate in particular to the development of education at this level in each country since about 1930, and in Chapter III will be found a full analysis and discussion of this development. Here we shall be concerned only with a brief review of the statistical data relating to the most recent period for which comparative data are available, namely the years 1955–57.

As a rough measure of the level of development in secondary education, it is possible to use the percentage ratio of total enrolment at the second level of education related to the size of population 15–19 years old inclusive.[1] This measure, which it is proposed to call the 'secondary enrolment ratio', is analogous to the 'primary enrolment ratio' introduced in the previous volume of the *World Survey of Education*.

The duration of secondary schooling may vary from three or four years to eight or nine years, depending on the length of primary schooling and on the way in which the different levels of education are articulated. For purposes of the present review, we may classify countries into three categories according to their secondary enrolment ratios: 50 and over, 25–49, and less than 25.

Table 6 below covers 77 countries for which comparative data are available for the periods 1950–54 and 1955–57. These countries are distributed by their primary enrolment ratios, duration of secondary schooling, and average secondary enrolment ratios for the years 1955–57. For comparison, the number of countries falling in each category of secondary enrolment ratios for the period of 1950–54 are shown in parentheses. It is noted that, whereas 43 of the 77 countries concerned had primary enrolment ratios of 60 and over, only 16 of them had average secondary enrolment ratios of 50 and over for the period 1955–57. Only 13 of these were in this category for the period 1950–54. Another group of 15 countries had secondary enrolment ratios of 25–49 in 1955–57 (14 countries in 1950–54). On the other hand, almost all countries with

1. The reader is reminded that the arbitrary choice of the age-group 15–19 years inclusive as the population base does not imply an exact correspondence of these ages with the actual ages of pupils receiving education at the second level. Hence, the 'secondary enrolment ratio' may fall short of 100, or even exceed 100, depending on circumstances.

TABLE 6. Distribution of 77 countries by primary enrolment ratio, duration of secondary schooling and secondary enrolment ratio, average for 1955–57

Primary enrolment ratio	Duration of secondary schooling	Number of countries by secondary enrolment ratio			
		50 and over	25–49	Less than 25	Total
60 and over	6 years or more	11	11	8	30
	Less than 6 years	4	3	6	13
40–59	6 years or more	1	1	5	7
	Less than 6 years	–	–	4	4
Less than 40	6 years or more	–	–	18	18
	Less than 6 years	–	–	5	5
Total number of countries	1955–57	16	15	46	77
	(1950–54)	(13)	(14)	(50)	(77)

primary enrolment ratios less than 60 had secondary enrolment ratios less than 25, although the total number of countries in this lowest category of secondary enrolment ratios decreased from 50 in 1950–54 to 46 in 1955–57. Obviously those countries with six years or more of secondary schooling had a better chance of finding themselves in the higher categories of secondary enrolment ratios. Thus, among the 16 countries with secondary enrolment ratios 50 and over, 12 had six years or more of secondary schooling; among the next group, with secondary enrolment ratios 25–49, there were 12 out of 15 countries which had six years or more of secondary schooling. However, in the lowest category of secondary enrolment ratios (less than 25), only two-thirds of the countries had six years or more of secondary schooling.

It may be noted that the 46 countries where the secondary enrolment ratio remained at less than 25 in the 1955–57 period are found widely distributed geographically as follows: four in Northern Africa, ten in Middle and Southern Africa, eight in Middle America, nine in South America, four in South-West Asia, one in South-Central Asia, five in South-East Asia, and five in Europe.

Table 7 below shows the distribution of 69 countries by their secondary enrolment ratios for 1955–57 and by the percentage of girls in their secondary school enrolment. The same general relationship will be noted between the percentage of girls enrolled and the level of the secondary

TABLE 7. Distribution of 69 countries, by secondary enrolment ratio and percentage of girls in secondary school enrolment, around 1955–57

Secondary enrolment ratio	Number of countries by percentage of girls in secondary school enrolment		
	46 per cent or more	Less than 46 per cent	Total number of countries
50 and over	13	3	16
25–49	7	6	13
Less than 25	9	31	40
Total number of countries	29	40	69

enrolment ratio as between the percentage of girls enrolled and the primary school enrolment ratio, as shown in Table 4. Thus, among the 16 countries with the highest secondary enrolment ratios all except 3 had 46 per cent or more girls enrolled in their secondary schools. On the other hand, among the 40 countries with secondary enrolment ratios less than 25, there were 31 where the proportion of girls in secondary school enrolment was less than 46 per cent. The middle group of 13 countries with secondary enrolment ratios between 25 and 49, are divided almost equally between the two categories as regards percentage of girls' enrolment in secondary schools.

The enrolment figures reviewed here comprise pupils in all types of schools at the second level of education. These types of schools may be grouped into three branches: general, vocational and teacher training. This classification is subject to two important qualifications. First, there are countries where general and vocational education are usually given in the same schools, though perhaps in different sections. There may be separate schools for certain types of vocational education, but the enrolment figures for such schools would represent only a small part of the amount of vocational education actually provided in the whole school system. Hence it would be misleading to treat these schools as if they constituted all vocational education provided at the second level. Again, in many countries, part or all of the teacher training is now provided at post-secondary institutions, enrolment at which must be counted in the third level of education and not the second.

Subject to these limitations, Table 8 below gives the average enrolment at the second level of education in 1955–57 for 23 selected countries, showing the percentage of pupils in each of the three branches: general secondary education, vocational education, and teacher training. It may be seen that the proportion of pupil enrolment in general education varies from 25 to 96 per cent, while vocational schools enrolled from 3 to 58 per cent, and teacher training schools from 1 to 28 per cent of the pupils. Some of these variations may still be due in part to different ways of classifying schools and pupils in the respective branches, but it is evident that the countries tend to have different degrees of emphasis as to the development of these three branches of education at the secondary level. For details regarding the various types of schools covered in the three branches, and their relative development over a number of years, the reader is referred to the country chapters of this volume and to a summary analysis given in Chapter III.

EXAMINATION RESULTS AND GRADUATES FROM SCHOOLS AT THE SECOND LEVEL

The number of pupils successfully passing final examinations or receiving graduation certificates depends not only on the number of pupils enrolled and the duration of their courses, but also on the educational policies and pedagogical practices of each country. If, for example, as in Japan or the United States of America, graduation from a general secondary school does not depend on a final examination, it is easy to see how the number of graduates can increase as rapidly as the total enrolment, subject to a time lag approximately equal to the duration of secondary school courses. On the other hand, if, as in France or Luxembourg for example, the award of a certificate is based on the successful passing of a final examination organized by the national educational authorities, the number of certificates awarded tends to be rather limited according to the predetermined policies in this matter on the part of the educational authorities. Such policies may be based upon considerations of academic 'standards', university entrance requirements, the needs of the country for skilled manpower, and other factors not determined by the size of total enrolment or the duration of schooling.

Nevertheless, an indication of the size of output of general secondary education, in relation to the size of a country's population, has a certain value for the administrator planning a national programme of education suited to the needs of the country. In particular, such data would be useful for the planning of education at the third level, as well as the placement of those graduates from the second level of education who are not able to pursue full-time education at the third level.

Table 9 (page 24) shows, for 34 countries, the average annual number of students passing the final examination or receiving diplomas or certificates at the end of their

secondary education. The countries are selected for the availability of comparable data, and listed in the order of average annual number of graduates per 100,000 population. It may be noted that the duration of studies leading to the final examination or diploma varies among the countries from four to eight years, and the average annual number of graduates per 100,000 population ranges from over 800 in the case of the United States and Japan, to less than 10 in the case of Haiti, Viet-Nam and Cameroun. The median among these 34 countries was 70 graduates each year per 100,000 population. Considering that the total world enrolment at the third level of education, in 1957, was about 362 students per 100,000 population (see following section of this chapter), it may be asked whether, in many of the countries covered by Table 9, the present output of graduates is sufficient to keep the supply of students for higher education at a satisfactory level.

Statistics on the number of students successfully completing various types of vocational education at the secondary level are not amenable to international comparison, owing to the uneven coverage of data and the divergencies in national systems of vocational education. The interested reader will find some relevant figures in most of the country chapters of this volume.

The annual output of graduates from teacher training schools at the second level, mainly destined for primary school teaching, must be considered in connexion with the size of primary school enrolment and the number of primary school teachers in service. It should be remembered that teacher training is provided in some countries only at the second level of education, in others only at the third level, while in many it exists at both the second and third levels. Hence the number of graduates from second-level teacher training schools does not indicate the total output of teacher training institutions. On the other hand, it is

TABLE 10. Number of pupils and teachers in primary schools and number of graduates from teacher training schools at the second level of education in 24 countries, average 1953–57

(arranged in order of graduates per 10,000 pupils in primary schools)

well known that many primary school teachers (even the majority of them in some countries) are recruited from other sources than graduates from teacher training schools. Thus the latter category does not represent the total supply of new teachers, whether qualified or unqualified, who are available for service in the primary schools.

Table 10 above presents, for 24 countries, available data on the average annual number of graduates from teacher training schools at the second level of education, related to the number of primary school pupils and teachers, all referring to the period 1953–57. The countries are listed in the order of number of graduates per 10,000 pupils in primary schools, which ranges from 51 in Argentina to 2 in Mozambique. The median for these 24 countries is 18 graduates per 10,000 primary school pupils. When compared with the number of primary school teachers in service, Panama shows the highest number of graduates (153) per 1,000 teachers; Mozambique (20) still occupies the lowest place. The median in this case is 62 graduates per 1,000 primary school teachers. Assuming an annual requirement of 10 per cent new teachers in order to meet the needs of increased pupil enrolment and replacement of teachers leaving the service, it may be estimated that the minimum number of new teachers required each year would be about 30 for each 10,000 pupils or 100 for each 1,000 teachers in service. As we have seen, the median numbers for the 24 countries covered by Table 10 are only 18 and 62 respectively. Only in five or six of these countries, do the teacher training schools at the second level of education seem to be producing enough graduates to meet such minimum requirements. Obviously the other countries must either have other sources of recruitment of new primary school teachers, or resort to less satisfactory solutions (such as increasing the size of classes or using the same teachers for two or even three daily shifts of pupils).

ENROLMENT AT THE THIRD LEVEL OF EDUCATION

As shown in Table 1, there were in 1957 an estimated world enrolment, at the third level of education, of nearly 10 million students, as compared with about 7.5 million in 1953. This represents a 34 per cent increase in four years—a rate of increase twice as high as that for the first level of education over the same period, and more than four times as high as the rate of increase in enrolment at the second level of education. Related to the total world population, there were about 362 students per 100,000 population in 1957, as compared with 289 students in 1953. Since the coverage of these statistics may not be equally complete for the two years in question, it is likely that the apparently remarkable growth in student enrolment may be partly explained by better coverage in the more recent year. Again, since the classification of schools by level, as recommended by Unesco, may not be applied in the same manner in all countries, the comparability of data, both over space and time, has certain limitations. Nevertheless, it seems safe to say that the expansion of higher education,

at a much more rapid rate than that of either primary or secondary education, is one of the outstanding features of educational development in the world during the period under review.

Unesco recommends the classification, as 'education at the third level', of that which requires, as a minimum condition of admission, the successful completion of education at the second level, or evidence of the attainment of an equivalent level of knowledge. Thus are included not only universities, but also teachers' colleges, higher professional schools, etc., which may not be of university level but which receive students only after they have completed their secondary education. In those countries (as the United States of America and Japan) where 'junior colleges' make up an important part of the higher education system, the number of students enrolled in these institutions may account for as much as one-eighth of the total enrolment at the third level of education. Again, in those countries (as the U.S.S.R.) where education by correspondence is well developed at this level, the number of correspondence students may constitute as much as one-third of the total enrolment.

Bearing in mind these and other elements of non-comparability between countries with different systems of higher education, it may be noted (from Table 1) that in 1957 more than 30 per cent of the world's students at the third level of education were found in the region of Northern America (Canada and the U.S.A.), and more than 20 per cent in the U.S.S.R. In other words, more than half of the world's students at this level (52 per cent) were found in these two regions. The whole of Asia had about 25 per cent of the world total; the whole of Europe (excluding U.S.S.R.) about 16 per cent; Middle and South America some 5 per cent; Africa and Oceania the remaining 2 per cent.

In relation to the size of total population, Northern America held first place with 1,635 students per 100,000 population, followed by the U.S.S.R. with 1,031 students per 100,000 population. Australia and New Zealand combined had a student enrolment of 573 per 100,000 population; next came Central Europe (440), Northern and Western Europe (400), Southern Europe (352), South America (269), Middle America (255), Northern Africa (187), South-East Asia (181), South Central Asia (174), East Asia (155), South-West Asia (122). Middle and Southern Africa, and the Pacific Islands of Oceania, enrolled barely 20 students per 100,000 population.

In considering the geographical distribution of students at the third level of education, one factor that must be borne in mind is that about 200,000 students, or nearly 2 per cent of the world's students at this level, are enrolled in institutions outside their home countries. For the host countries, the number of 'foreign students' may represent a substantial proportion of all students enrolled in their institutions of higher education. As shown in Table 11 (page 27), Austria for example was host to more than 8,000 foreign students in 1957, constituting no less than 32 per cent of its student enrolment in higher education, while Switzerland had 5,382 foreign students, more than 30 per cent of its total enrolment. Ireland had 19 per cent foreign students, and Syria 17 per cent, though the actual numbers were not so large. On the other hand, in those countries receiving the largest number of foreign students—U.S.A. (43,000), France (17,000), Federal Republic of Germany (13,000), U.S.S.R. (11,000)[1]—the proportion represented by these students among all students is not so high as in the other cases mentioned. The total number of foreign students enrolled in the 36 countries covered by this table increased from 88,000 in 1953 to 122,000 in 1957, representing a growth of 38.6 per cent. This is a higher rate of increase than the growth of total enrolment in higher education for the world as a whole over the same period.

Statistics are not generally available on the number of students from each country who are studying abroad. However, from a partial count of foreign students in 18 countries by country of origin,[2] it was found that, for example, there were in 1958 over 8,000 students from Greece studying in those 18 countries alone; over 6,000 students from China; over 5,000 students each from India, Iran and Korea; over 3,000 each from Hungary and the United Arab Republic; over 2,000 each from Morocco and Turkey; and over 1,000 each from Ceylon, Cuba, Indonesia, Iraq, Jordan, Malaya, Mexico, Philippines, Sudan, Thailand, Tunisia, Venezuela and Viet-Nam. How many additional students from these lands were studying in other than the 18 given countries is not known.[3] Thus it appears that, for those countries where national facilities for higher education are not adequately developed, it is imperative that their students should be able to attend the institutions of the more developed countries. This point is worth noting in connexion with the educational needs of the less developed areas of the world, a topic which will be examined in the latter part of this chapter.

The distribution of student enrolment at the third level of education by field of study, for 41 countries, covering about 55 per cent of all students in the world, is shown in Table 12 (page 28). The fields of study are grouped for convenience under 10 categories, which, except for 'law' and the category 'not specified', are defined as follows:

Humanities covers archaeology, history, languages, letters, library science, philosophy, psychology, theology, and similar subjects.

Education covers education, pedagogy, physical education.

Fine arts covers architecture, drawing, music, painting, sculpture, speech and dramatic arts, and similar subjects.

Social sciences covers banking, commerce, diplomacy, economics, ethnology, geography, home economics, international relations, journalism, political science, public administration, social welfare, sociology, statistics, and similar subjects.

Natural sciences covers astronomy, bacteriology, biochemistry, biology, botany, chemistry, entomology, geology, geophysics, mathematics, meteorology, mineralogy, physics, zoology, and similar subjects.

---

1. The United Kingdom, with more than 11,000 full-time foreign students enrolled in its universities in 1958, and Argentina, with more than 9,000 foreign students enrolled in 1957, are omitted from this table for lack of comparable data.
2. See *Study Abroad*, Unesco, Paris, 1960, Volume XII, pp. 677, 716–21.
3. The 18 countries, selected on the basis of availability of data on foreign students by country of origin, includes most of the countries reporting 3,000 or more foreign students (exceptions: U.S.S.R., Argentina and the Holy See) as well as some of those reporting between 1,000 and 3,000 foreign students in 1957 or 1958.

1. Universities only.
2. Not including part-time courses.
3. University of Chile only. In 1953/54 students born outside the territory of Chile were counted as foreign students.
4. Public universities only, including Algiers University.
5. Not including teacher training.
6. Not including St. Patrick's College.
7. And Singapore. For 1953/54 refers to University of Malaya only. For 1957/58 includes Nanyang University, which admitted students for the first time in 1956. Students from Sarawak, North Borneo, Malaya and Singapore are counted as national students.
8. Not including teacher training institutions other than university faculties of education.
9. Including teacher training secondary level (37,279 students in 1957/1958).
10. Not including Alaska and Hawaii indicated separately above.

Engineering covers applied science, construction, geodesy, metallurgy, mining, surveying, technology, textiles, and similar subjects.

Medical science covers anatomy, dentistry, medicine, midwifery, nursing, optometry, osteopathy, pharmacy, physiotherapy, public health, and similar subjects.

Agriculture covers dairying, fisheries, forestry, horticulture, rural science, veterinary medicine, and similar subjects.

In these 41 countries combined, which however do not include some of the countries with large numbers of students (such as the U.S.A., United Kingdom, Italy, etc.), there seem to be relatively larger proportions of students in the fields of engineering (21 per cent), humanities (17 per cent), education (14 per cent), and social sciences (13 per cent). Medical science (10 per cent), natural sciences (9 per cent), law (7 per cent), agriculture (6 per cent), and fine arts (1.7 per cent) are fields with relatively smaller proportions of students.

TABLE 12. Student enrolment at the third level of education by field of study, in 41 countries, around 1957

Field of study	Student enrolment	Percentage distribution
All fields	**5 556 356**	**100.0**
Engineering	1 155 290	20.8
Humanities	923 353	16.6
Education	801 896	14.4
Social sciences	708 101	12.8
Medical science	552 786	9.9
Natural sciences	510 876	9.2
Law	378 439	6.8
Agriculture	347 588	6.3
Fine arts	95 630	1.7
Not specified	82 397	1.5

The actual distribution of students by field of study varies greatly from country to country, as shown for 32 countries in Table 13 below. While it is not possible from these data alone to draw general conclusions, we note that certain countries, such as India and Pakistan, tend to have large proportions of their student enrolment (50 per cent or more) in such fields of study as humanities, and relatively small percentages (less than 5 per cent) in such fields of study as engineering and agriculture. On the other hand, in Czechoslovakia, Poland, and the U.S.S.R., engineering accounted for one-third or more of all students, while humanities had only 6 per cent or less. Among other countries with well-developed education at the third level, if we compare only the two fields, humanities and engineering, the balance is still in favour of the former, as for example in France (humanities, 25 per cent; engineering, 6 per cent), or in New Zealand (humanities, 26 per cent;

1. For 1958.
2. Not including Ecole Normale Supérieure d'Enseignement Technique.
3. Data relate to three institutions only.
4. Included with law.
5. Education and fine arts included in the other fields of study.

engineering, 6 per cent). Only in a few countries have these two fields received nearly equal attention as for example, in the Federal Republic of Germany (humanities, 22 per cent; engineering, 19 per cent), or in the Netherlands (humanities, 19 per cent; engineering, 18 per cent).

It is not possible to generalize on the relative proportions of women students in the different fields of study, since statistics on enrolment by sex and by field of study are not available for many of the largest countries such as the U.S.S.R., U.S.A., India and Japan. According to a partial count covering available information from 33 countries, the proportion of women students in the different fields of study ranges from 32 per cent in fine arts and 29 per cent in humanities to 3 per cent in agriculture and 1.4 per cent in engineering. There were about 23 per cent women students in medical science, 18 per cent in social sciences, 15 per cent each in natural sciences and in law, and 12 per cent in education. The proportion of women students in all fields of study, for these 33 countries, was 13 per cent.

GRADUATES FROM INSTITUTIONS OF HIGHER EDUCATION

It is estimated that the number of graduates from institutions of higher education around the world has reached a total of approximately 1.7 million each year, which is roughly one-sixth of the total number of students enrolled at the third level of education. Nearly 90 per cent of these graduates are accounted for by 37 countries, each reporting over 10,000 students enrolled and more than 1,000 graduates in a recent year. These countries are listed in Table 14 below, with the most recent data available on total number of graduates from institutions of higher education. This table suffers from the omission of a number of countries where higher education is well developed but for which no comparable data on graduates are available to the Unesco Secretariat.[1]

Certain observations may be made concerning the data presented in Table 14. First, the two countries—U.S.A. and U.S.S.R.—which have between them over 50 per cent of the world's students at the third level of education, account for more than 40 per cent of all the graduates from higher education institutions. Secondly, the ratio between number of graduates and number of students enrolled varies widely from country to country, ranging from over 30 per cent in a few countries (such as India, Netherlands, New Zealand) to under 10 per cent in many countries (such as Chile, Colombia, Pakistan, Spain, Turkey, United Arab Republic). Obviously, this ratio is affected by the inclusion or exclusion of those students receiving various types of diplomas and certificates below the standard of university degrees. This explains in part the discrepancy between, for example, Australia (where only university degrees and diplomas were counted in this connexion) and New Zealand (where more than half of the awards reported were at a level below the standard of university degrees). Finally, the time reference of the data in this table is not uniform for all countries. While in the majority of cases they refer to the year 1958, in a few instances, for lack of more recent data, figures for 1957 or 1956 have been used (in the case of India, the enrolment figure is for 1957 but the number of graduates refer to 1955). All these qualifications must be borne in mind by the reader before he draws any comparisons between countries from the figures here presented.

Comparable figures are not available to show the absolute

1. The following countries, for example, which are omitted from the table, are known to have 10,000 or more students enrolled in their institutions of higher education: Burma, China (mainland), Cuba, Denmark, Eastern Germany, Indonesia, Iran, Mexico, Puerto Rico, Rumania, Union of South Africa, Uruguay, Venezuela.

1. Graduates exclude those under the Bachelor degree level.
2. Including evening school and correspondence students.
3. Graduates are from public institutions only.
4. Students and graduates refer to universities only.
5. Graduates from universities only.

or relative increase in number of graduates, for all these countries, between two recent years. However, Table 15 below, which covers only 30 countries (among those not included being Argentina, China, India, Italy, Japan, Federal Republic of Germany, Mexico, United Arab Republic, United Kingdom), shows a 25 per cent increase in the total number of graduates between 1954 and 1958. The fields of study where the greatest increase was reported by these 30 countries are: engineering (61 per cent), and natural sciences (46 per cent). Agriculture (38 per cent), social sciences (33 per cent) and humanities (30 per cent) registered increases commensurate with the world average rate of increase in student enrolment at the higher education level. Graduates in medical science (16 per cent) and education (6 per cent) increased relatively slightly. No increase was shown in the number of law graduates; while fine arts suffered a decrease amounting to some 3,000 graduates (12 per cent of the number of graduates in 1954).

TABLE 15. Graduates at the third level of education, by field of study, in 30 countries, 1954 and 1958

PUBLIC EXPENDITURE ON EDUCATION

World summaries or international comparisons are extremely difficult, if not impossible, on the subject of educational expenditure. First of all, the coverage of data on educational expenditure, even confined to the government sector, is quite different for different countries. For example, capital expenditure may or may not be included; the figures reported may refer to all levels of government (central, provincial and local), or only to the central or federal government, or even to the Ministry of Education alone; expenditure on higher education may be included wholly or in part or not at all; various expenses for adult education, cultural activities, auxiliary services, etc., may be included or excluded. Secondly, educational expenditure from non-government sources (private organizations, religious bodies, households, etc.) is generally not available from official reports; yet private agencies play a more or less important role in the provision of education in a great many countries. Hence the accounting of only government expenditure on education very often presents an incomplete picture. Finally, unless there is an international unit for the expression of educational expenditure, any comparison between countries is affected by the real purchasing power of the amounts given in terms of national currency units.

One possible basis of comparison, which overcomes the last-named difficulty but not the others, is to relate the total public expenditure on education to the total national income of the country. Thus, among half of the countries shown in Table 17 (page 31), where it is known that capital expenditure was included in the total public expenditure on education (as reported), the proportion of national income represented by public expenditure on education ranges from 1.3 per cent to 6.9 per cent, with a median percentage of 3.5. Among eight countries in Africa, the range is from 1.9 to 5.5 per cent, with the median at 3.3 per cent. Among eight countries in the Western Hemisphere, the range is from 1.4 to 6.9 per cent, with the median at 2.5 per cent. Among eight countries in Asia, the range is from 1.3 to 5.5 per cent, with the median at 3.9 per cent. Among eleven countries in Europe and Oceania, the range is from 1.4 to 5.2 per cent, with the median at 4.0 per cent. These median percentages, based on limited numbers of countries, can only be taken as roughly indicative, since the inclusion of a few more countries in each case could change the medians substantially in either direction.

TABLE 16. Public recurring expenditure on education per pupil enrolled at each level of education, for selected countries

Country	Year	Currency unit	Expenditure per pupil[1]		
			Primary	Secondary	Higher
Brazil	1957	Cruzeiro	1 365	4 449	57 949
Colombia	1957	Peso	67	268	1 261
France[2]	1957	Franc	2 739	67 037	113 520
Hungary	1957	Forint	1 018	1 496	9 186
India	1956	Rupee	24	65	441

Tunisia	1957	Dinar	15	48	159
Viet-Nam, Rep. of	1957	Piastre	258	1 486	9 200
Yugoslavia	1956	Dinar	8 750	26 486	54 172

1. Based on total enrolment of full-time pupils, in both public and private schools.
2. Expenditure of the Ministry of Education only.

Another suggested method of comparison is to show the percentage distribution of total recurring expenditure by level and type of education. Such distributions are shown in Table 18 (page 33) for 78 countries, relating to various years between 1956 and 1959. Subject to all the limitations of comparability, it may nevertheless be noted that the relative proportion of expenditure for pre-primary and primary education, for example, can vary from 32 to 89 per cent; for secondary education, including general,

vocational and teacher training, from 7 to 47 per cent; for higher education from 0 to 24 per cent. Bearing in mind that, for the world as a whole, about 76 per cent of all pupil enrolment is at the primary school level, 21 per cent at the secondary school level, and only 3 per cent at the higher education level (see Table 2), it is evident that the relative costs of education at each level are often at great variance with the numerical importance of pupil enrolment at the respective levels.

Statistics are not available in sufficient detail and in comparable form to draw any international comparisons on this point. However, a rough idea of the relative amounts spent by government authorities on education at each level, per pupil enrolled in both public and private schools, may be gained from Table 16 (page 30), which covers only 16 selected countries. Thus, in Sweden for example, government expenditure on higher education was roughly three times as high as for secondary education, which in turn was about 25 per cent higher than for primary education, relative to the numbers of pupils or students enrolled at these levels. On the other hand, in Yugoslavia about twice as much was spent by the Government for each student in higher education as in secondary education, but the latter amount was three times as high as expenditure per pupil in primary education. These figures must, of course, be interpreted in the light of the actual coverage of government expenditure in each country, as well as the structure and organization of its educational system. They must not be regarded as the real cost of education per pupil, since many other factors besides government expenditure will have to be taken into account before the per pupil cost of education can be computed for any country.

Note. Owing to the rounding of figures the sum of the components may not add to exactly 100 per cent.

1. Includes special education, adult education, and other types of education.
2. Includes some expenditure by voluntary agencies.
3. Includes some capital expenditure.
4. Includes expenditure for teacher training.
5. Includes expenditure for teacher training at the higher level.
6. Refers to expenditure by the Central Government only.
7. Not including expenditure for Southern Cameroons.
8. Not including expenditure for higher education.
9. Includes some expenditure for secondary education.
10. Expenditure on scholarships for teacher training studies abroad.
11. Includes some expenditure for vocational expenditure at the higher level.
12. Includes expenditure for vocational education and teacher training.

13. Includes some expenditure on scholarships for higher education.
14. Includes expenditure for private education.
15. Refers to expenditure by Ministry of Education only.
16. Includes expenditure for vocational education.

The object of the following analysis is to highlight the main problems and achievements of education at all levels in 32 countries of Tropical Africa.[1] The group under consideration consists of all states and territories in Middle Africa, including the Malagasy Republic, but excluding French Somaliland, the Portuguese overseas provinces in Africa and island territories off the mainland. Also excluded are the Union of South Africa, and the three territories of Basutoland, Bechuanaland and Swaziland.

POPULATION OF THE REGION UNDER SURVEY

Over the nine years mid-1950 to mid-1959 the total population of these 32 countries rose, according to official estimates, from about 120 million to 155 million, an increase of nearly 30 per cent. The average annual rate of increase of population based on these estimates was 2.9 per cent. It should, of course, be borne in mind that the population estimates shown in Table 19 opposite for individual countries are subject to considerable reserves. Full censuses are rare in this area of great distances and poor communications, in which moreover the economic and social conditions are such that orderly census methods cannot be generally applied. Very little is known with exactitude of the past rate of population growth in Africa. Approximate projections of future population have nevertheless been attempted on various assumptions by the United Nations, and it would appear that estimates based on an expectation of rapid growth are justified. The current rate of increase seems likely to be at least maintained as improved health services and modern economic and social conditions are gradually achieved throughout the area.

On this basis, it may be assumed that the population of the area under consideration will reach some 175 million by 1970 and 200 million by 1975.

SCHOOL-AGE POPULATION IN TROPICAL AFRICA

No reliable statistical information is available on the age breakdown of population in the different countries of this region. However, some very approximate estimates of future child population (see Table 20, page 36) have been calculated for the period 1965–75 from the United Nations projections.[2]

From these it may be estimated that by 1975 there will be about 50 million children between the ages of 5 and 14 and 20 million young people between 15 and 19.

1. The reader is reminded that throughout this volume the names of states and territories reflect the political status of the world on 31 May 1960. (See Preface.)

1. Excluding Liberia.
2. Included with Somaliland (Trust Territory under Italian administration).
3. Estimate for 1951.
4. Estimate for 1960.
5. Estimate for 1956.
6. Including British Somaliland.

These estimates must be viewed in light of the current educational situation. Table 21 (page 36) shows enrolment at all levels of education in 1953/54 and 1957/58. It will be seen that despite an increase in total enrolment from 5.6 million to 9.2 million (over 60 per cent) during this period, the proportion of enrolment to total population increased only from 4.3 per cent to 6.4 per cent. To meet

TABLE 20. Estimated population of 32 countries[1] of Tropical Africa in 1965, 1970 and 1975

Age group	Approximate percentage of total population	Estimated population (in millions)		
		1965	1970	1975
5–14	25	40.0	43.8	50.0
15–19	10	16.0	17.5	20.0
5–19	35	56.0	61.3	70.0
Total population	100	160.0[2]	175.0[2]	200.0[2]

1. Comprising the 32 countries shown in Table 1.
2. It will be observed that these estimates although based on 'high assumptions' appear conservative in relation to latest official population estimates for 1959 and the rate of population growth in the area. (See Table 14.)

the growth in population and stem the tide of illiteracy in the present generation only an educational campaign of heroic proportions will meet Tropical Africa's enormous problem. The figures available are roughly estimated but their import can be exactly assessed. There are at present considerably under 10 million children and young people enrolled in educational institutions in tropical Africa out of a child population of not less than 50 million between the ages of 5 and 19 years inclusive. By 1975 it is estimated that there will be 70 million children in this age group.

The development of education varies, of course, between the different countries of the region but nowhere does pupil enrolment attain 20 per cent of the total population. In seven countries the proportion is between 10 and 18 per cent and in 18 countries, less than 5 per cent.

Table 22 (page 37) shows enrolment at the primary and secondary levels of education expressed as a percentage ratio of estimated population in the age groups 5–14 and 15–19 respectively. The age groups have been calculated

on the basis of the age breakdown assessed for the area of Middle Africa by the United Nations.[1] Thus for every country it is assumed that the age group 5–14 forms 24.2 per cent and the age group 15–19, 10,4 per cent of the total population. The population figures thus arrived at are purely estimates for purposes of comparison of enrolment ratios between countries.

The average primary enrolment ratio for the 32 countries combined is about 25 and the secondary enrolment ratio 3.5. However, the range of enrolment ratios is very wide and the median ratios—17 for primary and 2.4 for secondary enrolment—are considerably lower than the average ratios given above. Very approximately these ratios imply that in the region as a whole one child in four is enrolled in primary school but only three young people out of a hundred receive secondary education. For the age group 5–19 inclusive an average of 18 children per hundred are enrolled in some form of primary or secondary school.

The countries which appear better off from the enrolment viewpoint are Belgian Congo, Congo (Brazzaville), Ghana, Northern and Southern Rhodesia; in these countries the total school enrolment ratio is between 30 and 52. A group of six countries including Cameroun, Kenya, Malagasy Republic, Nigeria, Nyasaland and Uganda have total school enrolment ratios between 20 and 30. Twelve of the countries in the region, however, have total school enrolment ratios of under 10.

DEVELOPMENT OF PRIMARY AND SECONDARY EDUCATION 1953/54 TO 1957/58

Enrolment in primary schools in the 32 countries rose from 5.3 million in 1953/54 to 8.7 million in 1957/58, an increase of 63 per cent over 4 years at an average annual

1. United Nations, *Future Growth of World Population*, 1958. See also: Unesco, *Basic Facts and Figures*.

rate of about 12 per cent. Enrolment in secondary education increased from 303,000 to 521,000 pupils over the same period, an increase of 72 per cent at an annual average rate of 15 per cent. The median annual rates of increase were approximately the same as the average rates at both levels of education. (See Table 23 below).

The high rates of increase achieved at both levels of education over the past few years are a measure of the efforts already made by tropical African countries towards expanding their school systems. Their rate of progress is considerably higher than the world average increases in enrolment at primary and secondary levels which are approximately 5 per cent and 10 per cent per annum respectively. Moreover the advance is general throughout the area—in only one country was there a decrease in secondary school enrolment and this was probably due to a reclassification of technical education at the primary level. Seven countries in the region achieved an annual increase in secondary enrolment exceeding 20 per cent; 16 an annual increase between 10 and 20 per cent and the remainder under 10 per cent. In primary education more than half the countries under analysis achieved an annual rate of increase exceeding 10 per cent.

DISTRIBUTION OF PUPILS ENROLLED BY LEVEL OF EDUCATION

In comparison with other regions of the world, and in spite of the very rapid progress made in the past few years, the preponderance of primary school enrolment is particularly striking in Tropical Africa. In 1957, approximately 94 per cent of all pupils were in primary schools and 6 per cent in secondary schools, compared with 95 per cent and 5 per cent respectively in 1953. The number of students in higher education is infinitesimal—about one in a thousand

1. There was an apparent decrease in secondary school enrolment due probably to the reclassification of some secondary technical education at primary level.

of the school-going population against a world average of about 3 per 100. In relation to total population the low proportion of university level enrolments is equally striking: approximately 5 students per 100,000 population, compared with a world average of 385.

PROPORTION OF GIRLS TO TOTAL ENROLMENT

Table 24 below shows enrolment of girls in primary and secondary education in the 31 countries under study. Excluding the Belgian Congo, the enrolment of African girls in primary education numbered about 2.3 million around 1957, representing an average of one third of the total enrolment in 31 countries. As regards secondary education, figures available for 29 countries show that some 59,000 African girls were enrolled, representing about one-fifth of the total enrolment of African students at this level. The proportion of girls in the total enrolment varied considerably between countries and the median ratios were somewhat lower than the averages quoted above. There were in addition 425,840 girls enrolled in public and aided

6. Data for 1958/59.

primary and 3,220 in public and aided secondary schools in the Belgian Congo in 1959/60. In primary education the proportion of girls enrolled was the lowest in British Somaliland and Mauritania (6 and 8 per cent respectively) followed by Chad and the Central African Republic (11 and 16 per cent respectively). In other countries enrolment of girls exceeded 20 per cent and in 11 countries was 30 per cent or more of the total enrolled.

In secondary schools, five countries [British Somaliland, Chad, Mauritania, Niger and Somaliland (Trust Territory)] enrolled less than 10 per cent girls, 11 countries between 10 and 20 per cent and the remainder between 20 and 33 per cent.

PUPIL-TEACHER RATIOS IN PRIMARY AND GENERAL SECONDARY EDUCATION

For a number of countries data on numbers of teachers were available only for public schools. The approximate average pupil-teacher ratios for the 32 countries under review were 34 in primary education (the median was 38) and 24 in general secondary education (median ratio 21). (See Table 25 on page 39).

In primary schools, the highest ratios (more than 50 children per teacher) were observed in the Central African Republic, Chad, Congo (Brazzaville) the Malagasy Republic, Tanganyika and Togo. In a further eight countries the ratio was above 40. In only six countries were there fewer than 30 children per teacher.

In general secondary education the pupil-teacher ratios varied between a minimum of 9 in British Somaliland and Ruanda-Urundi to a maximum of 56 and 57 in the Malagasy Republic and the Central African Republic respectively. Eleven countries had pupil teacher ratios ranging from 21 to 40 and six others had ratios over 40. There were 15 countries with ratios between 9 and 20.

It may be considered that a satisfactory pupil-teacher ratio at primary level would be about 35 and at general secondary level between 20 and 25. On this basis, it will be seen that many tropical African countries are attempting to educate too many children with too few teachers, particularly at the primary level.

WASTAGE IN PRIMARY AND MIDDLE SCHOOLS

In a number of African countries the first level of education is organized in two successive stages, provided at primary and middle schools respectively. Table 26 below summarizes available data for some of these countries on enrolment of pupils in different grades of the primary plus middle school course. It will be seen that the enrolment of pupils in the first and second years of primary school is generally between 40 and 50 per cent of total enrolment. By the final grade of middle school, however, the proportion of pupils in relation to total enrolment was between 1.6 per cent (Tanganyika) and 8.6 per cent (Uganda). In 8 out of 15 school systems the proportion was under 5 per cent. It is interesting to note that whereas there was less wastage among girls than boys in the first two years of schooling, the percentage of girls surviving to the final grade at this level of education was, except in one country, lower than that for boys and girls combined.

These figures clearly demonstrate the high rate of wastage in primary education especially in the latter years of the primary school course. This falling off in numbers affects recruitment for secondary education and deserves

4. African education only.
5. Including two years' preparatory education in column (a).
6. Including three years middle school (fifth to eighth years).

serious attention on the part of the educational authorities concerned.

Table 27 below shows the percentage of pupils sitting for the Primary School Leaving Examination compared with total primary school enrolment in 10 French-speaking African republics with comparable systems of education. In 6 out of 10 countries over 5 per cent of the total numbers enrolled sat for the primary leaving certificate, though a much lower proportion actually passed. These results seem to indicate a somewhat lower rate of wastage in primary school enrolment than in some of the countries analysed in Table 25.

EXAMINATION RESULTS IN GENERAL SECONDARY EDUCATION

Partial results of examination in general secondary education in nine countries of Tropical Africa with approximately similar educational systems are given in Table 28 below. It will be noted that in all cases the number of successful candidates for the secondary leaving certificates has increased substantially over the past few years. In 1957 the proportion of girls among examination candidates varied in these countries from 6 per cent in Kenya (African candidates only) to 32 per cent in Zanzibar and Pemba.

In Table 29 (page 42) results of three different secondary examinations are given for 14 African countries with educational systems derived from the French system. Data on the number of girls passing these examinations were insufficient for inclusion in the table but two specific cases may be quoted: in the Malagasy Republic, in 1956/57, the proportion of girls among the successful candidates was 23 per cent for the lower secondary certificate (brevet), 28 per cent for the first part of the *baccalauréat* and 54 per cent for the second part; in Cameroun the corresponding percentages were 18 per cent, 8 per cent and nil.

There has been a striking increase in the number of candidates for these three examinations over the past three or four years in all French-speaking republics, reflecting the recent progress made in general secondary education.

HIGHER EDUCATION IN TROPICAL AFRICA

There are facilities available for higher education in only 13 of the 32 countries under review, and of these, a breakdown of enrolment at institutions at university level by branch of study is available for only 10. Table 30 (page 42) shows that in 1958/59 institutions in these countries enrolled some 8,000 students, including students from other African countries, most of which had no facilities of their own for higher education. In the 10 countries combined, 20 per cent of the students were studying the humanities, 20 per cent natural sciences, 14 per cent social sciences, 12 per cent law, 11 per cent education and 7

1. For 1956/57. 2. For 1957.

per cent engineering. Only 4 per cent were studying agriculture, despite the importance of this field of study in the African economy.

There were not enough data available on the number of women students for inclusion in the table but available figures indicate that they represented approximately 15 per cent of the total in all the countries combined.

It is very difficult to form any judgement on the appropriateness of the known distribution of students by branch of study in relation to the needs of the countries concerned. At present, the total number of students is so small that over-expansion of any one branch is unlikely in the foreseeable future. Moreover, the apparent lack of facilities for certain branches of study in particular countries is met at least in part by study abroad.

There are considerable differences within the 10 countries in the proportion of students enrolled in the different branches of study. The faculties of education seem to be relatively more developed in the English-speaking countries, while the faculties of law and social sciences absorb a higher proportion of students in the French-speaking countries. For example, over half the students in Kenya are in teacher training courses whilst in Senegal more than 40 per cent are in the faculty of law; in the Malagasy Republic the proportion of law students is two-thirds of the total.

The faculties of science, engineering and agriculture together account for some 31 per cent of the students enrolled in the 10 countries under review but emphasis on these three branches of study varies between countries. In Nigeria over 30 per cent are studying the natural sciences, 7 per cent engineering and only 1 per cent agriculture. In Ghana 18 per cent are studying engineering, 9 per cent natural sciences and 7 per cent agriculture. In the Malagasy Republic, science accounts for 26 per cent of students and in Senegal 21 per cent, but the faculties of engineering and agriculture are non-existent in the former and very small in the latter.

To complete the picture of higher education in these 32 countries it is essential to bear in mind the African students enrolled in institutions outside the region. Unfortunately data are not complete; in particular no satisfactory figures are available on the number of students from tropical African countries studying in France, the United States and the U.S.S.R. Excluding these important host countries it appears that in 1958/59 there were some 7,000 students from the countries under review who were studying abroad, principally in the Federal Republic of Germany, India, Lebanon, Senegal, the United Arab Republic and the United Kingdom. There were in addition small groups of students divided amongst some 20 other countries throughout the world.

TABLE 30. Enrolment in higher education in 1958/59 by branch of study[1] in 10 countries of Tropical Africa

1. The total number of students shown in each branch of study includes students from other countries and, in certain cases, students studying abroad.
2. Students in faculties or schools attached to university in 1957. Excluding separately established teacher training colleges with some 3,900 students in 1957.
3. Students in higher teacher training courses.

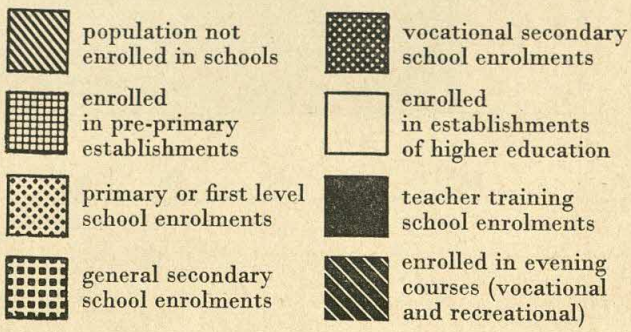
CHAPTER II

SCHOOL-AGE AND SCHOOL-GOING POPULATIONS

In the planning of educational programmes, statistics on school enrolment and on the school-age population are among the essential elements. It is often difficult, however, to obtain complete information both on the school-going population by age, sex and school level, and on the population by age and sex for the same year. The last edition of the *World Survey of Education* contained diagrams showing the demographic-educational structure in 10 countries; with information now available to the Unesco Secretariat, similar charts have been prepared for 13 countries. The data have been compiled on the same principles as in the last survey, but the picture presented by the diagrams has been supplemented by tables containing the basic figures on the population and school enrolment. The tables and charts, which with few exceptions relate to 1957, are generally based on the returns to Unesco questionnaires, but in some cases they represent national data published in official yearbooks and other statistical publications. In the diagrams in the last edition information was presented on the age-groups 0–30 years. This time the tables and charts relate in most cases to the age-groups 5–24 years. Data are in general offered for single-year age-groups, but in the case of some countries they are only available for combined age-groups.

The following pages contain tables and diagrams for Australia, Austria, Belgium, France, Federal Republic of Germany, Haiti, Iran, Japan, Netherlands, Norway, United Kingdom (England and Wales), United States of America, and Viet-Nam.

A study of these tables and diagrams will show for each country the proportion of the school-going population at each age and the quantitative relationship between school enrolment at the various levels. Certain other particulars in the tables and diagrams may be of interest, as for example, the proportion of girls enrolled at different ages and school levels, and the distribution of the enrolment at the second level by type of school.



Demographic-educational research will remain topical for a long time because the large age-groups, resulting from higher birth rates and lower infant mortality rates, will affect the enrolment at every level. For example, the present enrolment bulge in the secondary schools of some countries will be affecting enrolment in colleges and universities in the near future.

The diagrams also give a general view of the structure of the school systems. In regard to types of school, the diagrammatic treatment imposes certain restrictions—no more than six or seven types of hatching can be used in the small area available, and the limit of visibility is about 1 per cent, so that schools enrolling less than 1 per cent of the total population cannot be shown. It has been decided, therefore, to give precedence in the diagrams to broad types of schools or levels of education (as far as data are available), viz., pre-primary schools, primary schools, secondary schools, vocational schools, teacher training schools, and institutions of higher education. Data on adult education, and on special education for handicapped children, are excluded.

In the tables accompanying the diagrams will be found more detailed information on population by age and sex, and on school enrolment by level of education and by age and sex.

We believe this chapter will be found useful by readers interested in an analytical study of the demographic-educational structure in different countries. With the availability of new population data from the national population censuses taken around 1960, and with the further development of enrolment statistics by age and sex, it may be expected that similar presentation of these tables and diagrams will be possible for many more countries in the next edition of the *World Survey of Education.*

The key to hatching employed in the diagrams is:

AUSTRALIA

1. Including Fine Arts.
2. Excludes higher education, which enrolled 12,349 students in 1957.

IRAN. SCHOOL-AGE AND SCHOOL-GOING POPULATION, 1957

Note on diagram

For key to hatching, see page 43.

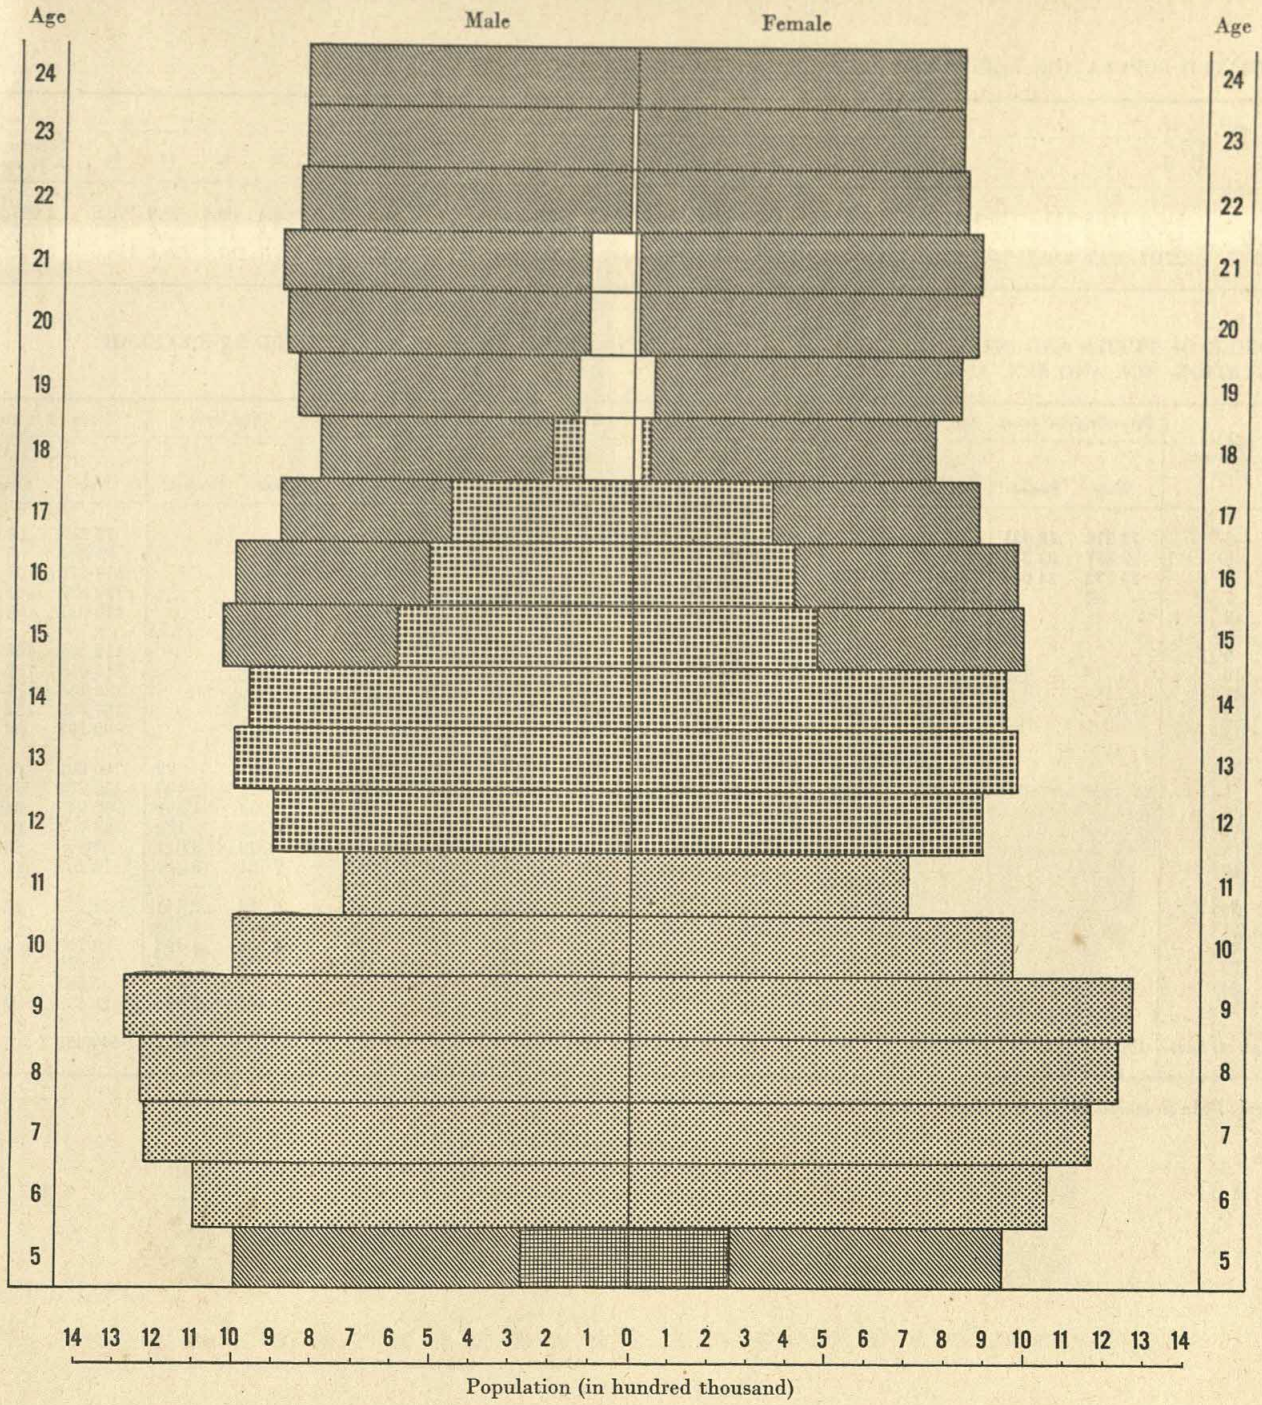
JAPAN

The material on these pages is taken from the publication *Education in Japan* (Tokyo, Ministry of Education, 1959). The text below and the table are quoted from page 81 of the original; the diagram opposite has been modified slightly by the omission of age-groups under 5 and over 24.

Most compulsory school age children attend compulsory schools and the percentage of enrolment is very high: the percentage of enrolment in elementary schools is 99.5.

The diagram shows the actual and relative distribution of total population by age and sex and level of school for those enrolled in schools.

School population data were available by grade and sex only. The age distribution of the school population therefore represents estimates based on normal progression of students through the grades. Students in miscellaneous schools are not included in the diagram.



Sex differences in percentages of total population enrolled in the schools are noteworthy, from the beginning of the upper secondary school. From this level on, the rapidly diminishing percentage of total population enrolled in the schools is accompanied by an increasing disparity between female and male school population.

The statistical data on which the diagram is based are shown in the table below.

ESTIMATED POPULATION AGED 3–25 YEARS, AND POPULATION ENROLLED IN SCHOOLS, BY AGE AND SEX, 1957

CHAPTER III

THE PROGRESS OF SECONDARY EDUCATION SINCE 1930

The object of the present chapter is to survey quantitative developments in the secondary level of education in various countries over the period 1930–57. The following is a brief explanation of the problems of definition and comparability encountered in the survey and the methods of calculation adopted.

TIME PERIOD COVERED BY THE SURVEY

Generally speaking, the statistics available on secondary education are less complete than for primary education and this is particularly true of countries whose school systems are in process of rapid evolution. Consequently, the time period covered by data on secondary education does not correspond in many cases to the 28-year period which forms the basis of this chapter. This might be because the sequence of years for which comparable information was available was very limited, or because problems of comparability became more complex over a long period. In spite of these limitations, which were considerable, it was felt worthwhile to present the data on secondary education over the entire time period when available, if only to discern a long term trend in a relatively few countries. The first part of the statistical analysis, therefore, concerns 41 countries for which statistics on secondary education are available over the whole period 1930–57. The second part of the analysis deals with secondary education in 93 countries and territories over the eight years 1950–57.

PRINCIPAL LIMITATIONS OF AVAILABLE STATISTICS

The limitations of international comparisons of statistics on secondary education must be emphasized. In the first place, there is considerable divergency in the national definitions of 'secondary education', a term which in some countries refers only to general or academic education at this level. An appropriate working definition, for the purpose of this analysis, is that adopted by the International Advisory Committee on the School Curriculum[1] in which the secondary stage of education is described as 'a broad based and diversified pattern of education which will cater for the needs of individuals possessing different aptitudes and likely to go into different occupations'.

The statistics used in this chapter divide secondary enrolment into three streams: general secondary education, vocational or technical education, and teacher training at secondary level. Unfortunately the data available are not always complete and distinctions between the different sectors of secondary education are often blurred.

Problems in the classification of general secondary education arose in the case of countries with intermediate level secondary schools. The solution adopted in this survey was to classify such schools at the secondary level, even though this means that in a few cases pupils of the same age and educational level are counted with primary school pupils in systems where the intermediate category does not exist. In practical terms, this method of classification tends to present in a relatively more favourable light the level of development of secondary education in those countries having an intermediate stage, say of three, four or five years' duration, following a primary school of four years, and in turn leading to an upper secondary stage of another three, four or five years. In other words, these countries are considered as having a total range of secondary education extending over seven to nine years, based on only four years of primary education, whereas other countries without the intermediate stage would be shown with only four or five years of secondary schooling based on seven or eight years of primary education. This discrepancy obviously affects comparability between countries, but does not invalidate comparisons over time for the same countries, except in the rare instance where a school system has been reorganized, or enrolment statistics reclassified, during the period under review.

Particular difficulties were experienced in comparing vocational education on an international basis. The structure of vocational education is undergoing change in many countries and the introduction of new courses affects comparability of figures from year to year. The relation of this sector to general secondary education is not always clear—the existence of secondary comprehensive schools with simultaneous academic and practical courses, in certain cases, complicates the task of obtaining separate data on vocational education. Some countries

1. Report of the fourth session of the International Advisory Committee on the School Curriculum, Paris, 1960. (Unesco/ED/171.)

reported part-time and post-school vocational education; others included such courses under adult education. Private commercial courses in subjects like shorthand and typing are fully reported in some cases and entirely omitted in other returns. The range of vocational education is vast and probably the most imperfectly reported of the three sectors of secondary education presented in this chapter.

Enrolment in teacher training at secondary level also presents difficulties of classification. Such training is almost always preceded by a period of varying length in general secondary education; thus, in many cases, teacher training extends the length of secondary schooling beyond the general secondary course. It is debatable whether the 'post secondary' teacher training which is, however, not of university degree standard should be considered as higher education. In general, a conservative approach has been followed and non-university teacher training is here classified as secondary education, unless the completion of general secondary education is a definite pre-requisite to the teacher training course.

Apart from these reservations, as a quantitative measure of the development of secondary education, pupil enrolment figures are still the best available. The alternative elements which might be used are the number of schools or the number of teachers. But as indices of progress in secondary education both are subject to much stronger objections than enrolment data.[1]

No attempt has been made in this survey to cover the progress made in secondary education in its broader sense. The content of curricula in different countries and changes in the scope of secondary school courses of a general or vocational nature are treated in detail in later chapters. A partial analysis of examination results in secondary education is given in Chapter I.

SECONDARY ENROLMENT IN RELATION TO POPULATION

As a statistical measure in analysing the development of secondary education on an international basis, it was decided to adopt in every case an arbitrary and frequently estimated age group covering the population 15–19 years old, and to calculate a percentage ratio relating pupil enrolment in secondary education to this population group. The resulting percentage ratio is referred to as a secondary enrolment ratio. This ratio rises, remains stationary or falls over the periods under review, and provides a rough indication of quantitative advance in secondary enrolment.

The ratio has no real significance for delimiting the age group normally covered by secondary education. It is merely a convenient measure useful for international comparisons; it may be added that the application of this very approximate secondary enrolment ratio to the statistical data under consideration has on the whole justified its use. The preliminary general impression of the extent and distribution of secondary school enrolment in the world and its probable rate of growth in different areas was confirmed in regard to the countries for which the data were analysed on this basis.

1. See *World Survey of Education: II–Primary Education*, Chapter III, page 45, on the difficulties encountered in using the number of schools, classes or teachers as a measure of progress in education.

MEASUREMENT OF CHANGES IN THE SECONDARY ENROLMENT RATIO

It is useful to measure the rate of change in secondary enrolment ratios as a means of comparing progress between countries. For this purpose the geometric rate of increase or decrease in the ratio was obtained by using the expression:

$$P_n = P_o (1 \pm r)^t$$

$$\text{or} \quad \frac{\log P_n - \log P_o}{t} = \log (1 \pm r)$$

In which P_o = amount at beginning of period
P_n = amount at end of period
r = rate of increase or decrease per year
t = number of years $(n - o)$

Thus this formula can be used when the values of P are available at the beginning and the end of the period under question, to arrive at an average rate of increase (or decrease).

The annual rate of increase in the enrolment ratio is a valuable indication of the growth of secondary enrolment for countries at various stages of educational development. For convenience, this rate is shown in the following tables as a percentage rate (i.e. $r \times 100$) and generally rounded to the first decimal place (tenth of a percentage unit).

COVERAGE OF THE STATISTICAL ANALYSIS

Although information is not available for all countries and territories of the world the analysis in this chapter shows data for 93 countries for the period 1950–57 and for 41 countries for the period 1930–34 to 1950–57. More detailed trend tables are presented in the respective country chapters in this volume. As far as possible, population and enrolment figures are given as five-year averages.

The data for child population were taken, where possible, from census results or current estimates of the population classified by age. In most cases, they were estimated by applying the percentage represented by the child population 15–19 years old in the nearest census or official estimate to the average total population of the period.

The considerable lack of precision in the estimated population data necessarily affects the enrolment ratio, and hence small changes in the ratio should not be regarded as significant.

CLASSIFICATION OF COUNTRIES BY LEVEL OF SECONDARY ENROLMENT RATIO

For convenience, the countries and territories covered in this survey have been grouped in four categories, indicating roughly the relative level of development of their secondary school systems. Subject to the practical limitations

mentioned above, the classification adopted is based on the level of the secondary enrolment ratio at the beginning of a time period, e.g., average 1930–34.

1. Countries with an initial secondary enrolment ratio under 10, which may be characterized as 'underdeveloped' in this respect.
2. Countries with an initial secondary enrolment ratio between 10 and 25, which may be characterized as 'developing' in this context.
3. Countries with an initial secondary enrolment ratio between 25 and 50, which may be characterized as 'moderately developed'.
4. Countries with an initial secondary enrolment ratio over 50, which may thus be characterized as 'well developed'.

PROGRESS OF SECONDARY ENROLMENT, 1930–57

Table 1 shows data for only 41 countries; nevertheless it provides a starting point for analysing the progress achieved in secondary education over the period 1930–57. Secondary education in countries with an initial enrolment ratio under 10 grew most rapidly. The median ratio for this 'underdeveloped' group of countries rose from 4 to 16 between 1930–34 and 1955–57 at a median annual rate of 5.6 per cent. Such countries represented nearly half the number

TABLE 1. Median secondary enrolment ratio and its rate of increase in 41 countries between 1930–34 and 1955–57

Secondary enrolment ratio in 1930–34	Number of countries	Median secondary enrolment ratio		Median annual percentage rate of increase

	Under 10 ('Underdeveloped')	10–24 ('Developing')	25–49 ('Moderately developed')	50 and over ('Well developed')

Secondary enrolment ratio 1955–57

G = General secondary education.
V = Vocational secondary education.
T = Teacher training at secondary level.

under analysis. The next most numerous group were countries with an initial ratio between 10 and 25 and their progress was also very rapid. The median secondary enrolment ratio for this 'developing' group was two and a half times as high in 1955–57 as in 1930–34, having risen at a median annual rate of 3.7 per cent. Eight countries with secondary enrolment ratios within the 'moderately developed' group doubled their ratios over the period under review at a median annual rate of 3.8 per cent. Only two countries were classified as 'well developed' and their rate of progress was necessarily slower. Nevertheless their median enrolment ratio rose from 56 to 81 at a median annual rate of 1.5 per cent.

The secondary enrolment ratio for all 41 countries combined doubled between 1930–34 and 1955–57 at a median annual rate of 4.1 per cent.

This preliminary analysis permits tentative conclusions of general application. First, the majority of countries fall within the groups, 'underdeveloped' and 'developing'. Secondly, it is within these groups that the most rapid rates of growth can be expected.

The limited number of countries for which data over the full 28 year period are available do not justify a breakdown by continent. Table 2, however, shows the movement of the secondary school ratios in the individual countries between 1930–34 and 1955–57 within the broad categories as defined.

The conclusions that might be drawn from Table 2 are that most countries promoted themselves through one or two categories of development over the 28 years 1930–57. The exceptions were four African countries, and two Asian countries which remained in the lowest category, and Austria and Burma which were stationary in the 10–24 category at the beginning and at the end of the period. On the whole, however, there was general progress in developing secondary education at all levels between 1930–34 and 1955–57. Perhaps the most encouraging feature was the rapid strides made by the least developed countries towards higher levels of enrolment in secondary education.

It should be noted that the code in brackets after each country denotes the coverage of the enrolment data available. Thus GVT indicates that data covered all three sectors of secondary education—general, vocational, and teacher training; GV indicates the inclusion of both general and vocational secondary education; G alone means only general secondary enrolment is covered. In a very few cases, where data for only one or two sectors of secondary education are available, the classification of the country may be underrated. This is the case for Sweden, for example, for which vocational enrolment is not available at the beginning of the period. In general, however, on the basis of available data, the omission of vocational or teacher training enrolment did not affect the category in which the country would be placed.

Table 3 shows the rate of progress in secondary enrolment achieved by 41 countries irrespective of their level of enrolment. Only two countries, Austria and Burma,

1. Excluding substantial enrolment in vocational education.

registered a very small decrease in their ratios. Some twenty-five countries achieved annual increases in their enrolment ratios of less than 5 per cent and this group included twelve European countries, four African countries, three in Northern America and two countries in each of the following regions: Middle and South America, Oceania and Asia. Eleven countries achieved annual increases of between 5 and 10 per cent including five Asian, two South American, and four European countries. Only three countries increased their secondary enrolment ratios at an annual rate exceeding 10 per cent and all were countries whose initial secondary enrolment was very small, giving rise to proportionately high increases in their ratios. For example, in Cambodia, average total enrolment in secondary education rose from 600 pupils over the period 1930–34 to 10,200 pupils in the years 1955–57. Hence the number of pupils increased seventeen fold over 28 years. The initial level of secondary enrolment in relation to the estimated population 15–19 years old was very low; nevertheless the ratio rose from 0.2 to 2.4 over 28 years, representing an average annual rate of increase of nearly 11 per cent.

The analysis so far is represented graphically in the facing diagram. The detailed figures will be found in Table 11 at the end of this chapter.

PROGRESS OF SECONDARY ENROLMENT, 1950–57

This section is concerned with the more recent trend in secondary education and covers the period of eight years between 1950 and 1957. The number of countries brought into the analysis rises from 41 to 93. Roughly speaking, this sample of 93 countries covers 86 per cent of the world population. By continent, the data are also, with the exception of Africa,[1] reasonably representative, covering approximately 95 per cent of population in North America, 94 per cent in South America, 90 per cent in Asia, 81 per cent in Europe, 78 per cent Oceania, and 42 per cent in Africa. Figures for the U.S.S.R. are also available for this period for upper secondary school enrolment.[2]

Table 4 repeats the pattern already observed in Table 1, but for a larger number of countries over a shorter time. The years between 1950 and 1957 appear to have been a period of very rapid advance in secondary education, particularly in the 'underdeveloped' countries. The largest number of countries analysed falls within this category and it is this group which achieved the most rapid rates of increase; over the eight years under review their median enrolment ratio rose from 3.6 to 5.6 at a median annual rate of 11.5 per cent.

The 'developing' group of countries with ratios between 10 and 25 also advanced fairly rapidly between 1950 and 1957 though their median annual rate of increase was much less than that of the preceding category; the median enrolment ratio rose from 16 to 21 at a median annual rate of 5.1 per cent.

In the 'moderately developed' group of countries the ratio increased from 35 to 42 at a median annual rate of 4.7 per cent. In the group of countries with the highest enrolment ratios the median enrolment ratio increased from 70 to 80 with a median annual rate of increase of 3 per cent.

TABLE 4. Median secondary enrolment ratio and its rate of increase in 93 countries between 1950–54 and 1955–57

Secondary enrolment ratio in 1950–54	Number of countries	Median secondary enrolment ratio		Median annual percentage rate of increase
		1950–54	1955–57	
Under 10	43	3.6	5.6	11.5
10–24	23	16	21	5.1
25–49	15	35	42	4.7
50 and over	12	70	80	3.0
All countries	93	11	13	5.7

Table 5 corresponds to Table 2 but for a shorter period of time and for more than double the number of countries. Although the rate of advance in secondary education has been particularly rapid in recent years, this table clearly could not be expected to show such a spectacular movement of countries between categories of enrolment ratios as was observed over the 28-year period in Table 2. Nevertheless, the proportion of countries with the lowest ratios is again particularly encouraging. While a comparatively large number (34) remained in the lowest category at the beginning and at the end of the period, nine entered the next higher group, including four South American and three Asian countries. One third of the 'developing' group also rose to the next higher category by the end of the period. These promotions included three Asian and three Middle and South American countries. In the two highest categories progress in enrolment is more marginal and hence the movement between categories is less striking than in the countries still developing their secondary school systems. However, the scope for further advance in the moderately developed category is quite considerable and this group of countries includes a fair number in Europe.

Table 6 shows the distribution of 93 countries by continent with their corresponding median secondary enrolment ratios. Twenty-two African countries had a very low median enrolment ratio in 1950–54 of approximately 1.8. During the period 1950–57, however, their median ratio increased to 3.3 at a median annual rate of 9.2 per cent. In 19 Asian countries, progress was even more spectacular; their median enrolment ratio almost doubled from 8 to 15 and the median annual rate of increase was over 11 per cent. Thus it is broadly true to say that in Asia and Africa, where the level of secondary school enrolment is the lowest, the largest strides have been made in recent years. In 20 Middle and South American countries the median ratio rose from 11 to 13 over the eight years under review at a median annual rate of 4.8. A high median annual rate of increase of over 7 per cent was achieved in the U.S.S.R.[1], and in five countries of Oceania, despite

1. Unfortunately, time limitations made it impossible to assemble comparable data on secondary enrolment trends for many of the newly independent States in Africa.
2. Grades 8–11 of general secondary schools.

1. This increase refers to the higher grades (8–11) of general secondary enrolment. In the lower grades (5–7) the trend in enrolment shows a decline. (See Chapter I.)

Oceania	5	36	48	7.4
All countries	93	11	15	5.7

1. This region comprises Canada and the United States, with Alaska and Hawaii calculated separately, since the period covered precedes their statehood within the U.S.A.

relatively high initial enrolment ratios. In Northern America and in Europe, where the highest levels of enrolment ratios are concentrated, the median annual rate of increase was 3.8 per cent. The median secondary enrolment ratio for all 93 countries was 11 in 1950–54 and 15 in 1955–57, having risen at a median annual rate of 5.7 per cent.

Table 7 gives a greater appreciation of the wide range of rates of progress within each regional grouping. The rates of increase in secondary enrolment ratios in the same 93 countries are shown irrespective of their level of enrolment. For seven countries the secondary enrolment ratios were unchanged or decreased between 1950–54 and 1955–57. These comprise three European, two Middle American and two African countries. The remaining 86 countries are divided fairly evenly into three groups: firstly, a group of 32 countries whose annual increase in enrolment ratio was under 5 per cent, which includes 10 European, 4 Northern American, 4 Middle American, 5 South American, 4 African, 3 Asian and 2 Oceanic countries. The subsequent group of 25 countries achieving an annual increase between 5 and 10 per cent includes 9 European, 6 African, 2 Middle American, 2 South American, 4 Asian and 2 Oceanic countries. The 29 countries with the highest annual rates

of increase include 12 Asian, 10 African, 4 Middle American, 1 South American, 1 European and 1 Oceanic country.

Thus the continental distribution of the countries within the highest category of increases confirms the conclusions tentatively advanced in the analysis of Table 6, namely that it is in a group of African and Asian countries that the rate of advance in secondary education in recent years has been the most rapid.

At the end of this Chapter, Table 12 summarizes the data for secondary enrolment and population used in the preceding analysis. The 93 countries are grouped by continent in alphabetical order. Further details of coverage will be found in the respective country chapters.

PROGRESS OF ENROLMENT SINCE 1930 IN THE DIFFERENT SECTORS OF SECONDARY EDUCATION

There are only a limited number of countries for which enrolment data on a comparable basis are available over the period 1930–57 giving a breakdown into general, vocational and teacher training enrolments respectively. The following analysis covers a rather small group of 15 countries which cannot be claimed as representative. They include four Asian, three South American and eight European countries. No African, North American or Oceanic country is included. The comments and conclusions on the following tables, regarding the relative weight and importance of general vocational and secondary teacher training respectively, should be regarded as purely tentative.

General secondary education. General secondary education forms the base of the pyramid to further secondary education of a vocational nature, either technical or pedagogic, and to higher educational institutions. As expected, Table 8 confirms that general secondary education is by far the largest element in secondary education, representing on an average about two-thirds of total enrolment. In 1955–57 the lowest proportion of enrolment in general secondary education was found in Argentina (24 per cent) and the highest in India (97 per cent). It should, however, be mentioned that data on other sectors of secondary education are inclined to be less fully reported.

Over the years 1930–57 the proportion represented by general secondary education in total enrolment did not substantially alter in most cases though it tended to rise by the end of the period under review. In the case of Japan and the Philippines the total elimination of secondary teacher training and at the same time a particularly rapid rise in enrolment between 1930 and 1957 explains the very marked rise in the proportion of general secondary enrolment.

Vocational secondary education. Table 9 shows that, on average, vocational secondary education accounted for somewhat more than a quarter of total secondary enrolment in the countries under review. The median percentage showed little change, standing at about 27 per cent both at the beginning and at the end of the period 1930–57. The lowest proportion of enrolment in vocational education was reported in India (2.2 per cent) and the highest proportions were observed in the Netherlands and Argentina (over 51 per cent in both cases) and in Norway (47 per cent).

Teacher training at secondary level. Enrolment in teacher training is the smallest numerical element in secondary enrolment in all the countries under review and its importance is generally diminishing as the process of upgrading teacher training to university level is gradually achieved. This transition was made by both Japan and the Philippines within the period 1930–57.

The median percentage represented by teacher training in the countries analysed in Table 10 declined from 3.1 in 1930–34 to 1.8 in 1955–57. By 1955–57 second level teacher training remained substantial in the three South American

countries analysed, but was generally lower than 3 per cent of total secondary enrolment in the eight European countries included in the analysis.

CONCLUSIONS

To sum up, it can be said that the preceding analysis has demonstrated the usefulness of the secondary enrolment ratio and its annual rate of increase in measuring progress in secondary education. The classification of countries into broad categories based on the level of their enrolment ratios established that those with the lowest ratios were the most numerous. In the countries analysed for the periods of 1930–57 and 1950–57 respectively, it emerged that the majority of countries fall within the ratio categories 'under 10' and '10–25'. The former group comprised many African, Asian and South American countries, and the latter covered a very wide range, including certain European and Middle American countries.

The analysis of the rates of increase in enrolment ratios, led to the conclusion that progress in improving secondary enrolment has been rapid and sustained, especially in recent years. The highest rates of increase were found in countries with the lowest ratios and particularly in Asia and Africa. Progress in Middle and South American countries seemed slower despite the scope for development which undoubtedly exists in this region. In most of Europe,

parts of Oceania and Northern America the countries had already reached a high level of secondary school development at the beginning of the period under review; their rates of increase over the longer and shorter term periods analysed are necessarily much lower than those in countries relatively underdeveloped educationally.

The relative importance of enrolment in general and vocational education respectively over the periods under review showed apparently little change. General secondary education was roughly two-thirds and vocational training one-quarter of total secondary enrolment in the countries surveyed. On the other hand, the proportion of students in secondary teacher training was, with few exceptions, a numerically small and declining element in the total picture of secondary education.

In conclusion, it is interesting to note that the median rates of increase in enrolment ratios observed in secondary education far exceed the highest rates of increase achieved in primary education over corresponding periods, even by countries with the lowest level of educational development.[1] In mitigation it must, however, be added that primary education necessarily remains the broad and frequently compulsory base for all further education. Recruitment for secondary education remains selective; except in a very few countries no saturation point is yet discernible in enrolment of youth in the age groups appropriate to secondary education.

CHAPTER IV

THE TRENDS OF EDUCATIONAL CHANGE

In many countries today the most intractable problems of educational provision and organization are those that concern the education of young people from about 11 or 12 years of age to 17 or 18, that is, the period of post-primary or secondary education, intermediate between basic primary schooling and the higher education of universities and specialized institutes. To say this is not to deny that in primary and higher education, too, there are grave difficulties: in fact for some countries it is precisely in these other fields that the most serious problems are being faced. Yet in the main the latter are problems of provision. There are countries that have not yet managed to provide for more than a minority of the children of primary school age and that are still far from achieving universal literacy; on the other hand, there are countries in which the number of university students will double during the present decade. But in each of these cases, though the task of providing facilities and teachers is fraught with serious practical difficulties, the needs are clear, there is considerable agreement on aims and methods, and the lines of advance are plain to see. At the secondary level, however, the situation is made extraordinarily difficult because the very conception of secondary schooling is in transition, and the practical difficulties of educational development are exacerbated by a confusion of aims and a conflict of views. For the comparative educationist, probably no aspect of contemporary education offers a more rewarding study than does secondary education; and in no other field have educators and administrators so much to gain from a comparative study of the problems manifested. For in studying secondary education trends over the last three or four decades it is possible to observe school systems passing through many different phases of development and facing problems that appear to be typical of these different phases.

To speak of phases of development in this way implies that there are regularities in the changes that have been taking place, and that persistent common trends can be perceived in spite of the wide differences in the way that the nations approach their own educational problems. It implies, too, that in respect of various aspects of education many different countries appear to be travelling in much the same general direction, although, because they started at different times and have developed in different circumstances, they are to be found at different stages along the way. Such a point of view is a useful one, provided we realize that an educational system is a very complex organization. When we think of an educational system we think of its schools, their nature and their distribution; we think of the curriculum; we think of the pupils, their range of abilities, their backgrounds, and their purposes in attending school; we think of the teachers, their training and attitudes; we think of the relationship of the school with State, Church and family; and we think of the nature of educational administration and control. These elements, which have their own direction and rate of growth, can be studied separately and trends common to a number of countries can readily be perceived; but it is far from easy to characterize the development of whole systems and make valid comparisons between them. Seen as a whole, each system of education is unique. It is at any given time the product of a set of historical circumstances—social, economic, ethnic, cultural—that are not likely to be duplicated in any other country. Administrators and educators who have the task of guiding the development of an educational system need to take all these factors into account, both those that are unique and those that are shared with other systems. A knowledge of common trends and regularities may conserve their efforts and resources by enabling them to profit from the experience of other countries that have faced similar problems in similar circumstances. On the other hand, lack of appreciation of the unique elements in a country's system may lead them to introduce changes that will not survive once the initial stimulus to change has departed.

In a survey of this kind the emphasis will necessarily be on general trends and regularities, the general stages of development through which educational systems are passing, and the problems to be met in the different phases of development. For it is by such a comparative analysis that the descriptive data on the various systems of education throughout the world can contribute to the solution of educational problems. From the detailed description of the different educational systems presented in the national section of the *World Survey of Education*, however, the reader will be able to gain some appreciation of the unique elements in the situation of each country.

THREE MAJOR CONTEMPORARY TRENDS

When the course of secondary education is surveyed from the most comprehensive point of view three major directions of change can be discerned, in each of which there has been an increasing tempo of development during the past thirty or forty years. These movements are themselves composed of several elements each showing its own characteristic trend yet each related to the others. In the most general terms they may be stated as follows.

First, and what is most obvious to the onlooker, is the vast expansion of secondary education throughout the world. This is partly due to population growth but there is also an educational factor: in countries almost untouched by formal schooling before World War II, the extension of primary education is now causing an extension of secondary education, while at the same time more advanced countries are reaching the point at which all their young people have the chance to begin secondary studies, and an increasing proportion is completing them. Expansion and extension of facilities for secondary education, then, is the principal direction of advance in the present era. The second main tendency follows from the first: it is the search for the best means of making an organic connexion between primary and secondary education. In most countries the systems of primary and secondary education were developed for different purposes and for different children, and it has not been easy to make a smooth transition between them. But even in newly founded education systems, unhindered by this traditional separation, there may exist distinctive aims for primary and secondary education which themselves create difficulties in the organization of a well articulated school system. The third major direction of advance is to be seen in the theory and practice of curriculum building. The scientific and technical achievements of the modern world and the complex sociological developments that have been taking place in recent times have themselves brought inevitable changes in the curricula of schools. But a no less striking change has been a result of the extension of secondary schooling to children for whom it was not originally designed, particularly those from the lower socio-economic strata of the community and those of lower scholastic ability; the general direction of this change in the curriculum has been towards an integration of cultural and vocational elements that have long been kept separate and even provided in different types of schools.

The widening of educational opportunity

In many important respects the secondary schools of the modern world have their origins in, or have been more or less strongly influenced by, the European grammar schools of the middle ages, whose main purpose it was to prepare for the universities young men attracted to the life of scholarship, and especially those whose families were not rich enough to engage private tutors. Very early in the history of grammar schools, however, their functions broadened to include the pre-university education of a considerable number of people who eventually became, not scholars and clerics, but statesmen, lawyers, doctors, magistrates and so on. At a later date the grammar schools were attended by pupils who had no intention of proceeding to the university, but who simply wished to prepare themselves for intermediate occupations in administration, commerce and industry which did not require university qualifications. With the rapid industrialization of Europe in the eighteenth and nineteenth centuries and the consequent need for an increasing number of well-educated members of the middle classes, there was constant pressure for an increase in the provision of secondary education and a steady expansion in the number of young people attending secondary schools. During the present century the growing complexity of social and economic organization in the highly industrialized countries has demanded a steady improvement in the education of all workers, and the idea of secondary education for all young people has become increasingly accepted in both principle and practice.

The extension of secondary schooling from a small group of potential scholars to all adolescents has brought about many changes in the form and organization of educational systems and also in the curriculum and teaching methods of the schools themselves. Until the dawn of the modern era, the universities of Europe were very largely devoted to the study of the learning of Greek and Roman antiquity, and the grammar schools had as their main function the early preparation of young people in Greek and Latin so that they could study in those languages at the university. As entrance to the university was the way to rise to the highest positions in the State, access to the secondary schools was the way to the privileges of a select class; so both they and the universities tended to resist any broadening of their traditional functions and studies. With the development of science and industry in the eighteenth and nineteenth centuries, however, the middle classes in several European countries grew in power and influence. They needed secondary schools for their children, and they needed modern scientific and commercial knowledge. At first the older schools resisted the newer needs and therefore different kinds of secondary schools were set up, for example, scientific and modern language schools and a variety of technical and commercial schools. Throughout the nineteenth and the early part of the twentieth centuries these schools struggled to obtain some of the privileges associated with the older classical schools, notably the privilege of preparing pupils for entrance to the universities and other institutions of higher learning and for the higher offices of the state.

When economic development required a rudimentary education for children of the working classes, quite different school systems were set up. They were complete in themselves, and at first taught only reading and writing in the mother tongue, and the elements of religion. Later their curriculum broadened to include arithmetic, general knowledge, drawing, handwork, singing, and other subjects.

The retention of separate educational systems for different classes in a community was possible only while that community was a comparatively static one. In the scientific and industrial societies of the present age, however, the need for skilled and well-educated men and women has been constantly increasing, and it was early found that this need could not be satisfied from the restricted ranks of the privileged groups alone. In Europe, throughout the latter part of the nineteenth century,

efforts were made to provide scholarships and free places for the more talented children of the lower middle classes and the working classes to enter the secondary schools, and some of these pupils found their way to the universities. Indeed, by the first decade of the present century the abler pupils of the industrialized countries of Europe could obtain a secondary education no matter from what social class they came, but the barriers were formidable and effectively prevented the development of the talents of more than a small minority of the able young people from the lower classes. These barriers were of several kinds: the type of education given in the elementary schools did not lead naturally to the secondary schools; the scholarships available were relatively few and paid for only a small part of the real cost of undertaking a prolonged education; and the loss of a young person's wages while he attended secondary school could be a serious hardship to a poor family. These and similar factors militated against the utilization of the talents of children from the poorer classes of the community, and indeed in some parts of the world they still do.

The unifying of primary and secondary education

In spite of these problems, efforts were continued to find ways of extending secondary education to all children and of building up the conception of secondary education as simply a stage in education following the elementary or primary stage, rather than a different kind of education running parallel to the elementary system and suitable for a different class of pupil. The process of changing over from the traditional to the new concept has usually comprised several stages. The first is the general acceptance of the idea that all children should have a common elementary schooling, preparatory to whatever form of secondary education they later proceed to, so that all have an equal chance of choosing widely or of being selected fairly for the next stage of schooling. Then the school-leaving age has been progressively raised so that all children may at least begin the first phase of secondary schooling and thus have the chance of seeing how far they are fitted to proceed with it. Along with this extension of compulsory schooling has gone the abolition of fees in the public secondary schools of many countries, the provision of maintenance grants and monetary allowances in necessitous cases, the setting up of boarding schools and school transport services to enable rural children to have access to secondary schools, and so on. Elaborate systems of selecting pupils for different kinds of secondary school have been developed in those countries that retained a variety of types of school at the secondary level. At the same time, with the upward extension of the leaving age, the tendency has been to put off until later and later the choice of vocation and the introduction of highly specialized vocational teaching in the school course. In the junior stage of secondary education a common curriculum has tended to be adopted by different types of school, and in some countries an amalgamation of different types of schooling has taken place, leading to the development of the comprehensive high school to which all the children of a community can go. In the comprehensive school, rigorous selection procedures at entrance have disappeared, being replaced by student-guidance in the choice of appropriate courses in the senior stages of secondary education.

The search for a balanced curriculum

Along with these changes in the structure of school systems have gone changes in the curriculum of the schools themselves. The traditional classical course was broadened to include, first, modern literary studies and the sciences, and later commercial, technical, and trade subjects. In some countries almost every aspect of social and economic life has come to be represented in the school curriculum. In the earlier phases of industrialization, the tendency was towards a proliferation of specialized vocational subjects, intended to fit the majority of young people to enter the world of industry and commerce at the age of 15 or 16. But the rapid development of technology and science and the greater complexity of industrial processes has called for adaptable young people with a better general education, who have not specialized too narrowly too early in life, and this has led to a later start in special training. This tendency has raised extremely difficult problems in curriculum construction. The general or liberal education traditionally provided by the secondary schools had always been highly academic, designed as it was to lead to the scholarly pursuits of the university. Doubts have arisen about its suitability to the needs of all young people. More and more, therefore, the secondary schools have become concerned to work out the content and methods of a general education appropriate for all young pupils, including those of average and below average intellectual capacity. At the same time they have sought to maintain the traditional standards of scholarship for pupils of high scholastic ability.

As the curriculum has changed, so too have methods of teaching. The introduction of practical subjects and subjects with a direct bearing upon the work of the world has led to constant efforts to adapt teaching methods to the subject. The concept of learning-by-doing has led teachers to search for methods that would effectively teach the skills, develop the knowledge, and foster the attitudes that are regarded as desirable. Educators have struggled against the traditional methods of teaching all subjects in a bookish way, especially those subjects in which bookishness is inappropriate; practical work, the organization of study around centres of interest, the use of projects, visual aids, group methods, classroom discussion, have all been adopted in the search for the most effective means of teaching the wide range of subjects in the modern school.

DEVELOPMENTAL STAGES REACHED BY 1930

The main trends briefly outlined in the preceding section indicate the general direction in which the secondary school systems of the modern world have been moving. Although some of these trends can be traced back to the Industrial Revolution and beyond, there has been no period so marked by radical and rapid changes as the past thirty or forty years. The rate of growth of secondary education and the consequential changes that have taken

place in its nature and purposes have steadily accelerated; for this reason the following chapters will present a somewhat more detailed analysis of various aspects of the dominant themes in its recent transformation.

But a detailed analysis, presenting separately the various aspects of a school system, runs the risk of preventing the reader from seeing any educational system as a whole, though this is essential to an understanding of its development; it may also obscure the fact that the different systems of the world are not all at the same stage of development and are not moving at the same rate. This is a most important fact, since, three or four decades ago there were in existence simultaneously educational systems illustrating many phases of the development that modern secondary school systems of European origin have been passing through during the past two centuries. Before a detailed study of contemporary trends is made, then, it will be useful to sketch briefly the salient features of some of these widely differing systems as they existed at the beginning of the period with which we are concerned, for no study of recent trends can be fully significant unless it takes into account the vast initial differences between the countries being studied.

The earliest radical break-away from the class-stratified educational systems of eighteenth and nineteenth century Europe took place in the United States of America. There, by the first years of the twentieth century, the idea of a free, publicly controlled system of comprehensive high schools following smoothly on from the elementary schools and catering for all the children of a community, no matter what level or kind of ability they displayed nor what the social status or economic position of their parents, was becoming widely accepted in principle and was increasingly put into practice.[1] The sharp distinction between academic secondary education and the various forms of specialized vocational training at the post-primary level, typical of European systems, had already largely disappeared. The purpose of the general high school was regarded as being to educate every pupil to his fullest development, so that each could make his richest contribution to the life of a democratic community. By 1930 more than half the young people between the ages of 15 and 18 were already obtaining full-time education, the vast majority being in the public high schools;[2] the main obstacle to universal schooling in this age group was not so much the nature of the educational system as the difficulty of making adequate provision for high schools in sparsely-settled rural areas and the hardship for poorer families in keeping their children at school when they could be earning money.

By this time, too, the major pedagogical problems of the comprehensive high school had been recognized, and throughout the country innovation and experimentation were directed towards finding solutions for them. Foremost among such problems were: how best to make the transition from the common elementary school curriculum to the diversified high-school curriculum—out of which arose the junior high school and the 6-3-3 form of organization which was in full swing in the late 1920s; how best to provide for the needs of children of all levels and kinds of ability and with all sorts of vocational ambitions—out of which arose the proliferation of subjects (which, by 1929, numbered as many as 250)[1] and the attempts to base the curriculum upon the immediate needs and interests of the young people themselves rather than upon the ready-made organization of subject-matter within the traditional disciplines; and finally, how to maintain the scholastic standards of the minority of young people who would be preparing themselves for entrance to the university—out of which came, for example, enriched or accelerated curricula for the more able pupils. These, and many other consequential problems of secondary education for all young people were already being faced in practice in the United States of America at a time when few other countries had proceeded beyond the stage of making it possible, by means of scholarships and free places, for some of the most academically gifted children of the working class to follow a full course of secondary education.

Among the countries which, by 1930, probably came nearest to the United States in their efforts to open up secondary education to talented children of all sections of the community were some of the English-speaking and Scandinavian countries e.g. New Zealand, Scotland and Norway,[2] and the U.S.S.R. These countries provided a relatively long course of compulsory common elementary education for all children before dividing them into specialized schools, and had made secondary education freely available to those who reached a satisfactory standard at the end of this common period of primary education. These countries differed markedly from the United States in that, by and large, they retained qualifying examinations which determined progress up the educational ladder, thus still regarding secondary education as an advanced education for the scholastically gifted. In consequence they had retained a curriculum that was essentially intended as a preparation for entrance to the universities or other institutions of higher learning; to provide for other kinds of education, separate post-elementary schools were created. This conception of the curriculum, together with the difficulty of providing educational facilities in sparsely settled rural areas, tended to limit the number of children going on to general secondary education.

In contrast to the countries just mentioned, in 1930, most States of Europe still retained, at the upper level of the primary school, the traditional separation between elementary education for the children of the working classes and secondary education for the middle and upper classes, although the idea of the *Einheitsschule*, the *école unique*, or the common single-track approach to public secondary education was receiving increasing support. 1924 France had abolished the distinction between the curriculum of the preparatory classes attached to the *lycées* and *collèges* and the curriculum followed in the elementary school up to the age when the work of the secondary school proper began, thus instituting a period of common primary education (from 6 to 11 years of age) for all children before differentiation began. In Germany immediately after World War I the preparatory school was abolished and a four-year *Grundschule* was established for the same purpose. At the end of these relatively short periods of common primary school the more gifted pupils could, with the aid of scholarships and remission of fees, enter the various secondary schools along with the fee-paying children. Some pupils went to the various vocational schools giving specific trade training, but the majority remained in the upper section of the elementary school until the end of the period of compulsory education. The courses of instruction in the post-elementary schools attended by the majority of children were short in comparison with the seven-year course of the French *lycée* or the nine-year course of the *Gymnasium* in Germany, and consequently only a very small proportion of young people continued with full-time schooling after the age of 14.

While reforms were being initiated in several European countries, in others the traditional systems showed little sign of change. So, too, in the Latin American countries whose educational systems derived from the European tradition. The independent republics of Latin America show a considerable diversity in their origins and in their social, economic, and educational development, but they also have so much in common that in a brief survey of this kind they can be considered together. The similarities in their educational systems when compared with the rest of the world are indeed, more striking than their differences. In the earliest years of European settlement small but highly developed systems of colleges and universities were set up, mainly under the influence of the Jesuit order, and provided a classical and humanistic education, similar in many ways to the basic culture of the upper classes of Europe prior to the Industrial Revolution. But economic development in Latin America was slow and provided little incentive for educational changes like those taking place in parts of Europe by the beginning of the nineteenth century.

In the independent States that emerged during the nineteenth century efforts were made to develop a primary education related to the basic needs of the masses. Considerable progress took place in the cities and towns, but secondary and higher education still remained the prerogative of a small minority. In many States, political instability hindered both economic and educational development. In consequence even as late as the second and third decades of the twentieth century the educational situation in most of the South American republics was in essentials little changed. Only a very small proportion of the children of secondary school age was in school; most pupils were the sons of wealthy landowners or of the urban middle classes, and their education was mainly literary and academic, emphasizing disinterested humanistic culture and designed to lead on to university study. A few pupils were enrolled in commercial and vocational schools, the development of which was still in the initial stages even in countries, like Brazil, which were beginning to be industrialized.[1]

Similar in certain respects to the educational systems of the Latin American States, were those of some independent States whose general economic condition was poor, though they supported a wealthy and educated élite—e.g. China, in the first decade of the Republic, with an intelligentsia divorced from, and largely indifferent to the fate of the illiterate masses—and most of the other independent countries of the East, with the notable exception of Japan.

Many other territories, particularly in Africa and Asia, were still under the control of one or other of the European colonizing powers. Even as late as 1930 it was seldom realized how soon independence would be achieved, and educational provision remained generally at a very rudimentary level. The colonial type of economy and administration needed only a small proportion of literate people to act as minor officials, clerks, agents, and elementary school teachers, and the main educational efforts were directed towards giving a literary education in the foreign tongue to a minority of children. It is true that, even in the nineteenth century, a few far-sighted colonial administrators were proposing measures to extend and differentiate the schooling provided, but little was done to implement their proposals. Primary education was not compulsory and few children were able to complete the full course, most dropping out after only a year or so at school. A very precarious literacy was achieved by those who attended the primary school, and only a small proportion of these reached a standard high enough to allow them to attend the secondary school—if their parents could afford to keep them there. The first schools in most countries were mission schools, which later received financial support from the Government. At a later stage governments usually established their own schools as well, to supplement the inadequacies of the mission schools.

Most of these countries were underdeveloped and the greater part of their working population was engaged in agricultural production, using primitive tools and methods. Great increases in productive efficiency could hardly take place until a more appropriate basic education had been made available to the young people and until technical and vocational training were established. Neither of these conditions was present in the 1930s. Some attempt at technical education had been made in most dependencies, but its success was prejudiced from the beginning by several factors. First, since few people could envisage the emergence of their countries to independent status there was little incentive to attempt to construct a diversified, balanced economy. Secondly, a considerable proportion of the educated indigenous population had themselves become wedded to the idea of a literary academic education leading to administrative work in official positions and they did not press for technical facilities. Thirdly, apprenticeship training, where provided, was in general based on a very small amount of primary education; this made it difficult to get the able young people to undertake vocational training even when technical schools or courses were set

1. *Secondary Technical and Vocational Education in Underdeveloped Countries*, Paris, Unesco, 1959 p.9. (Educational Studies and Documents, No.33.)

up, for most preferred the traditional secondary education. Finally, in many dependencies the economic difficulties of the early 1930s caused many set-backs in education, and the technical field was one in which educational expenditure was frequently curtailed. Only a few of the larger countries had any institutions of higher learning of their own, and, in general, university education was restricted to a small number of secondary school graduates who could go to Europe for further study. And even though very few pupils ever went on to the higher stage, the curriculum of their own secondary schools was almost entirely designed to lead to the university entrance requirements of the European universities most closely associated with their country.

In 1930, then, the general world situation was that in the relatively advanced nations of the European civilization the opening up of secondary education for all children was just beginning to be generally envisaged, though it had in fact already occurred in a handful of countries; but for the greater part of the world's population only the beginnings of a primary education were conceived of as a possibility. Few people foresaw the period of rapidly accelerating advance that the world was to enter upon in little more than a decade.

THE ACCELERATION OF CHANGE SINCE 1930

It will be evident from the foregoing brief sketch of the development of secondary education reached in different communities by 1930, that the nature and rate of educational change have varied considerably according to the stage of development of countries, their varying social and economic situations, and their history, traditions and ideals. It is, of course, possible to state trends and problems in such a general manner that the similarities from country to country are emphasized. We can readily see that all countries are expanding their post-primary school populations, some by the provision of secondary education for the first time, others by extending educational facilities to more and more children of lower levels of ability than formerly entered the secondary schools and to more and more children from sections of the community which in the past seldom achieved more than a rudimentary literacy. We can also see that each country faces serious problems in the supply of buildings, equipment, and trained teachers to make provision for the expanding school population, and we can appreciate the common problem of allocating more and more of a community's resources to the support of education. Furthermore it can readily be foreseen that problems of curriculum construction, of educational guidance and selection, and of teaching methods, will arise, for the solution of which there are few precedents in the history of education. To see and understand such similarities as these is of great value: it enables the administrator to view his country's educational development in the perspective of the historical development of the contemporary world. At the same time, faced with the necessity of judging the best course of action to take when dealing with the concrete problems of his own country, he must also know intimately its present circumstances, immediate needs, and current trends. Without the long perspective, the administrators and teachers responsible for guiding the development of an educational system may be confused and vacillating; on the other hand, without a clear vision of the immediate needs and forces at work their best-intentioned educational reforms may be ineffectual in practice.

The different groups of countries already referred to provide useful examples of the way in which similar general problems are given a particular and distinctive quality by the fact that they occur in different local settings and at different phases of development. In the United States of America, which has had universal primary and junior secondary education for half a century, the past few decades have seen a steady extension of facilities for senior secondary education to more and more young people from 15 to 18 years of age, until at present some states have nearly all their 17-year-olds at school. In such states the major educational preoccupation over the past five decades has been how to devise the best curriculum for young people of average and below average intellectual ability. For them the college preparatory courses that were the staple of traditional secondary schooling were inappropriate; on the other hand, the wide variety of specific vocational courses developed in an earlier phase of industrialization have become unsuitable in an age of automation, when an increasing number of people are required to reach a high level of general unspecialized education before learning the exact vocational skills they will use in their work. The attempt to solve this curriculum problem, which is essentially one of re-thinking the conception of a liberal or general education and harmonizing it with vocational training, so as to make it valuable for all young people in an industrialized world where new technologies and new sources of power are rapidly being introduced, provides the key to many innovations in American high schools and to a good deal of the current controversy about the quality of their schooling.[1] And in countries like Australia, Canada, and New Zealand, where the proportion of young people remaining at general secondary schools beyond the age of 15 has been relatively high for some years, the same problems have forced themselves upon the notice of the educators.

In the same period, European States that were highly developed economically but whose economies had suffered more from wars and whose educational resources had been limited both by their economic difficulties and their inheritance of class-stratified school systems, have found their most pressing problems to lie in the extension of their educational facilities to provide junior secondary education for all children, and in the re-shaping of their educational structures to ensure that the fullest educational opportunity is open to all young people of high ability irrespective of their social background. Not only have they had to undertake vast school-building programmes, but they have had to decide whether to retain the variety of different types of school at the senior-primary and junior-secondary stage or whether to develop a comprehensive school at the junior secondary level; whether to continue to select children for different types of schooling at the age of 11 or 12, or

1. J. B. Conant, *Education and Liberty*, Cambridge, Harvard University Press, 1953.

whether to delay such differentiation until 14 or 15, and provide a common education emphasizing orientation and guidance during the 11 to 15 period.

Nearly all the independent, or nearly independent, underdeveloped countries have shown a remarkable expansion of basic primary education over the past 30 years, and over the past decade in particular the need for an increased provision of secondary education has become urgent. In those States like the Latin American republics that have been self-governing for several generations, the traditional structure of an academic secondary education for a social and intellectual élite, who will be the political and economic leaders of the country and will man its civil service, its commercial and industrial enterprises and its learned professions, has been in existence for some time. The recent acceleration in urbanization and industrialization is now calling for a steady increase in the number of young people obtaining an academic secondary education; at the same time a rapid growth is urgently needed in facilities for technical and trade training, which are now being provided for pupils at a much younger age and after a much shorter period of primary education than would be acceptable in the more highly industrialized parts of the world. In this sense, countries like those of Latin America are now entering a phase in their educational development that corresponds roughly to the earlier periods of industrialization of countries like Germany, Great Britain, the Union of Soviet Socialist Republics, and the United States of America. But not having made that radical break with the European tradition that characterizes the organization of North American and Russian secondary education they have tended to build up a differentiated structure at the junior secondary stage.

In many respects the underdeveloped areas of Africa and Asia that have only recently achieved political independence, or that are just reaching this stage, show similar educational needs and trends. This is particularly so in respect to their recent rapid development of basic primary education, in their need for developing the technical and administrative skills of their people in order to increase their economic productivity, and in the way in which their educational structures, rudimentary though they be, take their shape from European antecedents. But in a most important respect the newly independent countries differ from the old: few of them, until quite recently, have had enough of their own people sufficiently well educated to carry all the administrative responsibilities of a modern State. A fuller provision of general education at the secondary and the university levels is still needed. So pressing indeed is the need of these countries for general secondary education that even the education of technicians has tended to take second place. Foreign technical assistance can help to fill the gap temporarily, but the time for having a large number of foreigners in government and administration appears to be rapidly passing, and one of the immediate tasks of the secondary schools and institutions of higher education is to prepare a generation of young people who can take over entirely the political and civil affairs of their own countries. One serious difficulty, seen clearly in countries like India and Pakistan, is that it will be a long time before the effective provision of primary education for all can be afforded, and therefore in the field of secondary education such countries are concentrating their efforts upon the discovery and education of the most able young people only: a wider spread of facilities for secondary education is still a long way off.[1]

CHAPTER V

THE EXPANSION OF SECONDARY EDUCATION

The great expansion of secondary education throughout the world during the present century, and especially over the past few decades, is a product of many different causes. The increased birthrate at the time of the second world war and immediately afterwards resulted in a wave of enrolments in those countries that were involved in the war, but there have been many other factors and among them three of prime importance: the recent creation of facilities for education in areas where these have hitherto been lacking; the opening up of access to these facilities to children from sections of society that previously would not have been able to take advantage of them; and the changed conception of the need for education at the secondary level, with the consequent steady lengthening of the time that pupils stay at school. These factors are all related, but for convenience they can be considered separately, for each of them is complex and comprises many different aspects. For example, in the opening up of access to facilities for secondary education there is the provision now being made for the education of girls in countries that have retained longer than others the older view that the education of women was either unnecessary or undesirable. Then there is the spreading of secondary education to rural areas and other remote regions that have always been difficult to serve but that now, with modern transport, regular mails and the radio, are being brought within the scope of educational services. And when we consider the lengthening period of secondary education, we become aware not only of the part played by the increasing ability of parents in the economically well developed countries to keep their children at school longer as their standard of living increases, but also of the increased holding-power of school systems themselves as they adapt their curricula to the needs of a wider range of young people. Nor should we forget, in this connexion, the significance of the fact that the advancing technology of the modern world needs more and more young people to have a longer general education rather than an early training in specific vocational skills, and that this is one of the most striking features of education today in the countries that are technically advanced.

It has already been pointed out that the earliest provision for organized education in the modern Western world took the form of classical grammar schools to initiate young men into those writings on the arts and sciences that were to be found in the literature of Greece and Rome. They were attended in the main by a very small number of children from the upper classes of society, though some of them were expressly founded for the education of poor children of ability. The provision of vernacular schools giving fundamental education in the elements of literacy was a later step, and the diversification of schooling to develop vocational skills among the young people of the working classes occurred in comparatively recent times. This process of extending educational facilities downwards, and enlarging them to include vocational training, has been a characteristic feature in the growth of modern education systems in self-governing States. In some of the industrialized countries of the world the expansion process started early in the nineteenth century and did not reach its most diversified forms until the beginning of the twentieth century. Many countries that have just begun to be industrialized are now passing through these same phases, as the following examples will show, though at a much faster tempo and as the result of a more conscious and deliberate planning than was the case with the older systems. At the same time the older systems are moving towards a different phase, in which early vocational differentiation of schooling is being eliminated and a much longer period of common schooling is being provided. Throughout the world many examples can be found of countries which are in different phases of this process of differentiation and integration. The following are a few case studies.

THE ESTABLISHMENT OF NEW SYSTEMS

Of the many States which have recently come into existence, some have achieved independent status for the first time, others are ancient nations that have long been in eclipse. In the main they have been economically underdeveloped countries, and several of them have attempted a rapid process of modernization in which phases of development that lasted centuries in the case of the Western States have been compressed into decades.

The first task in a nascent or renascent State has usually been the consolidation of a system of communications, order, and law, and next has come the development of a more productive economy. In carrying out their adminis-

trative and economic plans governments have found themselves handicapped from the outset by the lack of civil servants, technicians, managers and so on, and an early need, then, has been the development of a system of education that could quickly enable the State to fill the administrative and executive ranks. With poor resources and lack of time, educational efforts have been aimed directly at the selection and education of such an élite. In these circumstances it is common to find that a few institutions of higher learning have been set up, together with institutions at the secondary level preparing students for higher learning, long before any serious attempt has been made to develop a widespread system of elementary or primary education for the majority of the inhabitants of the State—for whom, in any case, few teachers could be found until secondary education had expanded. This parallels what happened in the early phases of development of the more advanced European States.

Countries such as Ethiopia, Iran, and Turkey provide recent examples of the process of creating a new educational system in order to consolidate or modernize a State, and a careful study of the process is instructive.[1]

Any one of these or several other countries would provide a fruitful field of study, but the illustration chosen here is Iran because the effective beginnings of its modern educational development coincide fairly closely in time with the 30- or 40-year period with which this survey is chiefly concerned.

During the nineteenth century the power of the European States began to influence the ancient Persian civilization, and a few Western institutions began to be borrowed. A polytechnical college was established in 1852, staffed by foreign professors of military studies, medicine, languages, and so on. It gave the elements of Western knowledge to a small band of students, many of whom then studied at higher institutions abroad and subsequently returned to their country to serve in positions of responsibility in the machinery of government. A few private schools, both indigenous and foreign, were established later in the nineteenth century, but they too served only a small part of the population. The basis of community life was the rural family, and the basic education of the community was that which was passed on from parent to child in the ordinary course of everyday rural life.

When a constitutional revolution took place in 1906 and a parliamentary system was established, an attempt was made to set up a centralized system of public education. The fundamental statutes of the Ministry of Education were promulgated in 1911, but several years of political instability both before and during the first world war effectively prevented any solid progress from being made by the administration. This period ended with the rise to absolute power of Resa Shah Pahlavi (1925). To consolidate the power of the Central Government over the anarchic feudal chiefs a reorganized civil service was needed. The chief lack was educated men for positions of administrative responsibility. Neither the work of the private schools nor the method of sending students abroad was able to fulfil the needs of the time, so efforts were made to found a state system of education; and in this system it was the secondary and higher education of an élite that was most urgently needed.

Secondary schools were established, modelled largely upon those of France in respect of their administration and curriculum. The shortage of teachers was acute, many were foreign and, as a temporary measure to improve the supply, each year a group of secondary school graduates was sent to Europe, mostly to France, for further training. Major advances were made in 1928 with the raising of the status of a teacher training centre in Teheran to that of an *école normale supérieure*, and in 1934 with the founding of the University of Teheran, the passing of a law on the training of teachers, and the elaboration of the first official programme of studies for secondary schools. At the same time plans were made for the gradual establishment of a considerable number of *écoles normales primaires*. The studies instituted in the secondary schools were mainly literary and humanistic. They aimed at the formation of an intellectual elite, and constituted the staple education of an executive and administrative section of the community that was rapidly increasing in size and importance.

The emphasis which of necessity was initially placed upon the consolidation of governmental power allowed, however, two marked deficiencies to detract from the value of the educational system. First, the provision of fundamental primary education for the general population was very inadequate even in the towns, and was almost non-existent in the rural areas. Secondly, only very meagre facilities were developed for technical and scientific education and for trade training. These deficiencies continued throughout the period of consolidation of governmental power, and they seriously militated against the improvement of the conditions of life of the general population, the greater part of whom had been allowed to remain illiterate and technically undeveloped. The events of the second world war stimulated attempts to develop a more democratic form of government, to modernize the economic system, and to improve the living conditions of the general population. To achieve such aims as these a vast expansion of education was needed, especially in the primary and technical fields, and the past 10 to 15 years have seen vigorous attempts to build up a network of schools serving the whole of the children of Iran.

A somewhat different set of educational problems has been faced by those more recently emerging nations which from their very beginnings have been attempting to build States that are not only independent but also democratic. In such cases educational effort could not be channelled entirely into the provision of a secondary education system for the formation of a ruling élite, but attention has had to be paid also to the need for raising the cultural and economic standard of the general population whose active participation in government is envisaged. In the economically underdeveloped countries the problem of deciding how to balance the claims of primary education against the claims of secondary education has proved to be a very difficult one. The demand for welfare services,

including the enlargement of educational provision, has sometimes gone beyond the immediate economic resources of the country. Some extension has been possible at once, but more has had to await the development of greater productivity. Greater productivity, in its turn, has been found to be largely dependent upon the improvement of the skill and knowledge of the people, and exactly how best to break this vicious circle is the practical problem of new States—like those of Ghana, India, and Pakistan—which have been taking careful account of both economic and educational factors in their working out of long-range plans for national development.

The example of Ghana may be taken to illustrate the way such problems arise and the practical difficulties that have to be confronted.[1] For a decade prior to the achievement of independent status in 1957 one of the major factors influencing the trend of development of the Gold Coast, as it was then called, was the knowledge that self-government would shortly be a reality and that much educational expansion would be necessary if effective organs of government were to be developed by the African people themselves. The most serious shortage, it was known, would be in well-educated people able to undertake the executive and administrative functions of the new State. As in most territories that have been subject to colonial rule, there had been a long period during which such functions had been carried out in the main by officials sent out by the controlling power—usually Europeans educated in European secondary schools, universities, and institutions of higher technological training. What secondary education was provided for the indigenous population was usually just enough to train clerks and minor officials in the civil service and in commerce and industry. This, indeed, was a frequent complaint of those who were looking forward to political independence. As was pointed out strongly in the Report of the Commission of Inquiry into Disturbances in the Gold Coast, in 1948: 'We found no African who seriously suggested that there was as yet a sufficient number of Africans with the education or experience capable of filling an appreciable number of posts in the higher branches of the public service in the Gold Coast. But this very fact we found to be a source of complaint. It was said, and we think with some justice, "You have not provided us with sufficient opportunities to learn. In cases where we have learned you have not given us the opportunity to show our capacity".'

At that time there were only about 4,000 secondary school places in a country with a population of over 4 million people and with nearly 200,000 children in primary schools. The immediate need was clearly for a rapid extension of secondary education, and the commission recommended that the highest priority should be given to the provision of more secondary schools for the most able pupils and for the extension of senior primary school classes and part-time education for those of lower academic ability. To provide an appropriate continuation of secondary education the Government had already decided, in 1947, to convert the university classes at Achimota College into a separate institution, later called the University College of Ghana, and this gave a clear and immediate direction to the growing system of secondary education.

But an extension of secondary education was not in itself enough in an emerging State which aimed at having an enfranchised population taking part in general parliamentary elections. In 1951 the first majority African government was formed, and one of its early actions was to draw up a far-reaching plan for accelerated educational development, having as its goal the establishment of a comprehensive educational system within five years.[1] The Government's next concern was to extend primary education as widely as possible, for more than three-quarters of the adult population was estimated to be illiterate. Primary education was made free, and a steep rise in enrolment took place: in five years the primary school population doubled and has since continued to rise steadily. To cope with this a large-scale school building programme was got under way and many new teacher training institutions founded. The strain on the economic resources of Ghana has been considerable, and the problem of keeping a balance between primary and secondary school development has been a difficult one. A serious dilemma, clearly envisaged by the Commission of Inquiry in 1948, is still recognized: that if too large a proportion of the nation's resources should be invested in primary education in the early stages of educational development, secondary and higher education may be stunted. It is a dilemma that confronts several countries at the same stage of development as Ghana. At the higher levels the university classes and the sixth forms of the secondary schools have not yet produced as many students as the country needs: the proportion of primary and middle-school pupils going on to the secondary schools is low, partly because of scholastic selection, partly through the economic handicaps placed upon families that support young persons through adolescence, and partly also because of the difficulty of making provision for children in rural areas. There is also a high drop-out rate caused by various scholastic and socio-economic factors. In these circumstances some people have considered that more effort should be made to keep a greater proportion of children at middle school and secondary school for a longer period, and that the rate of provision of further facilities for the enrolment of primary pupils, many of whom will leave after only a very short span of schooling, should be somewhat reduced.

Other people, however, maintain that a third factor should be considered, namely, the possibility of rapidly increasing the wealth of the country by increasing the technical knowledge and skill of the people. If this could be done, the country would be able to afford to continue to make rapid advances in both primary and secondary education. This, indeed, has been the aim of the Ghana Government. In 1954 it opened the Kumasi College of Technology, and has since built several new institutions for technical education and trade training. Their enrolment has been increasing rapidly, but they still have only a small number of pupils compared with the secondary schools, and it will be some years before their influence on the national economy can be felt.

1. Gold Coast, Legislative Assembly, *The Development Plan, 1951*, Accra, Government Printing Department, 1951, Chapter 4.

With the gradual development of commerce and industry in economies that have been hitherto agricultural and pastoral, there is a pressing need for training in elementary commercial and industrial skills for those young people who will become supervisors, foremen, skilled craftsmen and so on. In nineteenth century Europe many of the rapidly developing industrial countries established complex systems of vocational schools catering for a wide variety of occupations. In their earlier phase of development such institutions took pupils from the primary schools, and provided courses of one, two, or more years, according to the nature and the level of the occupation being prepared for. Together with the academic secondary schools, which took pupils of high ability at an earlier stage of primary schooling, the vocational schools catered for a minority of children—the majority going to work after primary schooling only. In the underdeveloped areas of the world such vocational training was non-existent for a long time and even when special educational institutions were founded they have tended to grow slowly until quite recently.

States that have been independent for many years have already passed through the stage of establishing a system of vocational training schools, though these have often been few in number; and many of those States that still have vast natural resources underdeveloped are now on the verge of rapid advance. For example, in the Latin American countries and in several other politically independent but economically underdeveloped countries, schools for the training of artisans in urban trades such as carpentry and joinery, brick-laying, furniture-making, plumbing, printing, upholstery work, dressmaking, weaving, and so on, were established at various times throughout the past hundred years; somewhat later, commercial schools were founded, teaching shorthand, typewriting, accountancy, and various aspects of commercial practice. Sometimes these schools were private foundations, sometimes they were set up by government or local authorities, and usually they were not under the control of the ministries of education but, as in many European States, were the responsibility of other ministries such as those of industry, commerce, or science and arts, a division of functions that often caused difficulty in co-ordinating educational courses later on. They took young people who had had some elementary education and organized either full-time or part-time courses of instruction, usually of short duration, to provide for the immediate needs of the trades. More advanced schools, or upper divisions of existing vocational schools, were also founded to prepare higher-grade technicians in electricity, mechanics, mining and so on. Recruitment into these advanced courses was mainly from the ranks of those who had made good progress in the lower technical courses.

By 1930 most of the independent underdeveloped countries had a small nucleus of different vocational institutions in the main towns, and though their enrolment was small in proportion to the total school population, and often infinitesimal in proportion to the total general population, the problem of expanding the available facilities was beginning to be faced. The provision varied from country to country, according to their differing economic situation, and over the past 30 years all have been feeling their way towards systems that would be appropriate to their needs.—The disastrous effects of the world economic depression upon countries with highly specialized economies led to many attempts at building more self-sufficient and more balanced systems. In the underdeveloped countries the need for elementary technical training was especially felt, and renewed efforts were made to enlarge the scope of vocational education.

In many underdeveloped countries, such as Brazil and Ghana, although there have been striking increases in the number of young people enrolled in vocational schools or vocational courses during the past few years;[1] many hindrances to an adequate development of scientific and technical education are reported. One of the most serious is that many of the techniques now needed are more complex than the older ones; they require more understanding of basic principles and more adaptability in the young worker, and are less capable of being learned by rule-of-thumb methods by uneducated people. In the early years of industrialization in Europe it was possible for apprenticeship and trade-training to be undertaken with an illiterate population, but now several years of primary education is the minimum basis on which the modern vocational skills can be built. Attempts to make provision for vocational training for very young people have in fact proved uneconomical. This being the case, adequate vocational training and the diversification of educational provision that goes with it, cannot nowadays be greatly extended until a full primary education is generally available. In many of the underdeveloped countries, however, a large proportion of the children of primary school age fails to stay at school for as many years as are needed to give them a good basic education, and some vocational training is started earlier than it would be in a more developed economy.

The improvement of agricultural techniques has been recognized as of urgent importance for the foundation of a more diversified economy; for when the productivity of the rural areas is increased workers will be released for more varied occupations and families will be able to afford to dispense with the work of their children so that the latter can stay longer at school. Continuation classes in the rural primary schools are being used in several countries of South America, Africa, and Asia to bring about an improvement in agricultural practices, and adult education is being used for the same purpose. The end result of such trends as these is that educational provision is being greatly diversified at both the junior secondary and senior secondary level in most of those countries that have entered a phase of accelerated industrial development.

The provision of diversified vocational education at the junior secondary stage for young people from 11 or 12 to 15 or 16 years of age is now regarded as premature in those countries that have become highly industrialized, yet in many respects such provision did occur at an earlier stage of their own development. In the first decades of the present century, in Austria, France, Germany, the Netherlands, Switzerland, and the United Kingdom for example,

1. *Secondary Technical and Vocational Education in Underdeveloped Countries*, Paris, Unesco, 1959. (Educational Studies and Documents, No. 33.)

a variety of special types of school grew up to provide for the further education of children who had completed their primary schooling and who had not gone on to middle school or secondary school. Full-time vocational schools, as well as part-time courses for apprentices, trained young people for the common trades, agricultural occupations, and commercial employment characteristic of the different countries and, except in sparsely settled rural areas, facilities for specialized training were within the reach of all children who would be working in the world of commerce and industry. In a few countries such specialized courses began as early as 11 or 12 years of age after five or six years of primary education, but the general tendency came to be to defer vocational training until the age of 13 or 14, after seven or eight years of primary schooling.

Recent reforms in some countries have had the effect of putting off until even later the beginning of specialized training. This is partly a response to the nature of modern technological processes that require a higher level of general education and greater mental flexibility in the young trainees, and partly in response to the growing need for an extended general education if the future citizens of modern States are to carry out their civic duties in a satisfactory manner. The exact age at which specialized vocational training can best be started varies according to the stage of economic and industrial development reached by a given country and according to the nature of the citizens' participation in government. It varies even within a country, especially when there is a wide range of regional differences in economic life. Throughout the relatively undeveloped regions of Asia and Africa, the period of basic schooling tends to be shorter in rural areas comparatively untouched by the applications of modern science and technology than it is in the more highly developed parts. In country districts compulsory attendance laws may be unenforced at the upper levels of primary schooling and the early secondary years, not only because there are too few school buildings and teachers but also because no pressing need is felt for more than the minimum of literacy. With the advance of technical development, however, the upward extension of education is steadily occurring everywhere; the differences between areas are now mainly a matter of the age levels at which the most vigorous growing points are to be found. The problem of extending educational provision is not a new one; it was being faced in the rural areas of Europe, the United States, and the British colonial settlements throughout the latter half of last century, and there are many parallels between earlier developments in those areas and recent trends in the newly independent countries.

THE EXTENSION OF EDUCATIONAL OPPORTUNITY

In the circumstances in which school systems are created and education is made available to communities, the nature and potential abilities of the individual children themselves have little or no influence upon what can be provided for them. They are born into a highly developed society or a primitive one and their possibilities for full development are largely determined by extraneous factors over which in their early years they have no control.

The expansion of facilities for secondary education has usually been of benefit in the first instance to children of parents who were financially able to maintain them for a period of extended schooling prior to their entering employment, and who were imbued with a sense of the importance of education to help their children get on in the world. This is self-evident in the case of the establishment of private schools and endowed schools. It is even true of most public school systems in the early stages of their development. Sometimes, indeed, the provision of public secondary schools has been retarded for this reason. In the United States of America, for example, on several occasions in the latter half of the nineteenth century when districts were establishing public secondary schools financed from local taxes, there was opposition on the ground that the community should not pay for schools that would be used only by the children of a minority of parents who, in any case, could probably afford to make private provision for their children.[1] In general, however, the belief prevailed that the provision of such facilities should be a charge on the public purse, even though they would not be equally used by all sections of the community. In countries where democratic access to secondary schools is possible but where many of the inhabitants have too low a standard of living to enable them to keep their children at school for an extended period, efforts are made by means of scholarships, maintenance grants, etc., to enable some children of the highest capacity to benefit. In the meantime the capable young people who are fortunate enough to receive advanced education are looked to as one of the main sources of that ultimate improvement of the general living standards which alone can provide a complete solution.

One of the outstanding trends of recent years has been the attempt to free human development from the stunting effects of culturally impoverished environments. In so far as modern school systems are concerned, the first major efforts were those intended to mitigate the consequences of the stratification of classes in the States of Europe. Even although the particular forms of social stratification found in them in the nineteenth century are not the same as those found in other parts of the world today, much can be learned from the course of events in these States. Indeed, all countries of the contemporary world are still facing the problem of how to ensure that each child obtains the sort of education that is best for him, while at the same time the community is provided with an adequate number of people trained for the kinds of activities upon which its characteristic way of life depends. In earlier times children were confined within the bounds of the social classes and occupations of their parents; the present trend is to take more heed of the individual child's own abilities and interests, not only out of solicitude for the well-being of the individual himself but also because it is believed that a higher development of skill and ability will be achieved when a person's education and work suit his nature. It is instructive to study the processes of change as widely differing societies have faced the problems raised by the trend to make access to educational facilities more democratic.

1. I. L. Kandel, *History of Secondary Education*, Boston, Houghton Mifflin, 1930, p. 438.

From the most general point of view the greatest differences in approach can be seen by contrasting the course of development in those countries like the United States of America, certain of the British Dominions, and the U.S.S.R., which made a radical break-away from the class-stratified systems of Europe at a comparatively early stage in their educational history, and those countries like France, Germany, Great Britain and most of the industrialized European States in which a highly developed system of educational provision at the post-elementary level had come into existence at a time when class divisions and barriers between classes were more rigid than they are today. To show the contrasting problems most clearly, the development of post-elementary education for all young people in the United States is outlined first of all, and then some of the European States are presented to illustrate the different facets of the problem of democratization caused by differences in their social structure.

By the end of the second decade of the present century many of the problems of extending the provision of secondary schooling to all adolescents had been faced and in part solved in the United States of America before they were seriously being considered in most other parts of the world. The belief that secondary education was simply a stage in the general process of education of all young people and was not a particular type of education for an intellectual or social elite, was already widely accepted both by the American public and by educators. The view that a comprehensive high school would best serve the varying needs of all boys and girls no matter what their level of ability, their social background, and the place in society they were to occupy later, was also generally accepted, and much of the educational effort of the time was devoted to the practical problem of how such aims could be carried out most effectively. The free public high school was seen as a guarantee of equality of opportunity for young people in the U.S.A., just as a generation or so earlier the elementary school had been. The concept of equality of educational opportunity was itself changing: it no longer meant merely that the most able children, no matter from what social class they came, should have equal access to the traditional secondary school whose purpose was to prepare students for entrance to the university. It was coming to mean, rather, that each and every adolescent should have the education needed for his optimum development. The United States made the first attempt in history to provide a secondary education for all the young people of a nation in a single institution at the public expense. The two major problems that remained to be solved in the U.S.A. were, first, how to effect a smooth transition between the traditional stages of primary and secondary education, and secondly, how to construct a suitable curriculum in which the cultural and vocational elements were properly balanced.

The comprehensive high school is still a comparatively young institution, but its influence upon the world of education has already been great. Over the past 30 or 40 years several countries appear to have been moving towards a similar solution to the problem of providing secondary education for all. Some have already moved almost as far in certain respects as have the majority of the states of the U.S.A., while others are only just beginning.

It will therefore be useful to review briefly the course of educational development in the U.S.A. as a background to the study of similar trends in other countries.

The making of the public high school in the United States of America[1]

The first secondary schools founded in the North American colonies during the seventeenth and early eighteenth centuries were essentially Latin grammar schools similar to those in Europe. Their purpose was primarily to prepare a few young men for college and university, more particularly for entrance to the Christian ministry. They were attended, also, by other young people who had no intention of entering either the ministry or the university, but they were never regarded as providing education really suited to the needs of the leaders of a pioneering nation. By the middle of the eighteenth century the onset of the Industrial Revolution had created a need for scientific and commercial training among the urban middle classes in Europe, and this was provided by a new type of school, the academy. On the eve of Independence academies began to be established in the North American colonies.

The leading citizens of the new republic were imbued with ideals of liberty, democracy, and the perfectibility of mankind, and with these ideals went a belief in the value of education as the chief means by which men could perfect themselves. They were prepared to give public support to educational establishments, and the growth of academies was stimulated by grants of land. The academies themselves were versatile institutions. Founded by groups of citizens who were experiencing directly the need for a varied education, they provided instruction in subjects as diverse as reading, writing, arithmetic, grammar, geography, map-making, field and canal surveying, navigation, astronomy, trigonometry, plane and spherical geometry, algebra, chemistry natural philosophy, moral philosophy, rhetoric, logic, Latin, Greek and French. They were also flexible: the course that a student took was composed of whatever subjects he needed to prepare him for the duties he felt life would require of him. The academies reached the peak of their importance by the middle of the nineteenth century. Essentially, however, the academy was still a school for an elite, though an elite conceived of in very wide terms as people capable of developing a high degree of skill in any of the major arts that were of practical utility in the business of life. Essentially, too, it was a fee-charging private institution, and with the widespread extension of free primary education people became critical of these restrictions on further learning.

A new phase in the development of secondary education was initiated by the founding of free high schools by public authorities. As early as 1816 the Constitution of the State of Indiana stated the far-reaching principle that 'It shall be the duty of the general assembly as soon as circumstances will permit, to provide by law for a general system of education, ascending in regular gradation from township schools to a state university, wherein tuition shall be gratis and equally open to all'. Other states adopted the same

1. I. L. Kandel, *History of Secondary Education*, Boston, Houghton Mifflin, 1930, p. 438.

principle, but it was many years before it could be put into effect. Meanwhile, the English Classical School, founded by the School Committee of Boston in 1821, opened the new era. It was originally planned for young men who needed a modern education and who did not intend to enter university, but it was quickly followed by other public high schools which taught both classical and modern subjects, and which were as comprehensive in their curricula as the academies. The new high schools spread throughout the states, not only in the cities but also in the rural areas, where small school districts would combine into a larger unit for the purpose of maintaining a high school. By the last decade of the century public high schools were accepted every where as the natural extension of the elementary school.

Their selective character at this stage is clearly evident in the report of the Committee of Ten on Secondary School Studies, set up by the National Educational Association in 1892 to define the functions of the high schools and to suggest standards of achievement at which they should aim. While the committee stated unequivocally that the secondary schools of the United States, taken as a whole, did not exist for the purpose of preparing boys and girls for the university, it was just as definite that their main function was to prepare for the duties of life that small proportion of all the children in the country—a proportion small in number but very important to the welfare of the nation—who showed themselves able to profit by an education prolonged to the eighteenth year, and whose parents were able to support them while they remained at school. By the beginning of the twentieth century it was generally recognized that the free public high school was a single institution, in which intellectually able pupils could pursue as wide a range of studies as their communities thought were needed to fit them for entrance to the university or for some form of gainful employment. The greatly increasing wealth of the United States at this period encouraged parents to keep their children at school longer, and as there were no institutional barriers preventing the entry of pupils to high school after they had completed their primary education, the high school population was transformed during the first quarter of the present century. It was no longer an elite, either intellectually or socially, and was rapidly becoming a representative cross-section of the whole community.

By 1930 more than half the young people of the United States between the ages of 15 and 18 were attending public high schools, and educators were giving serious consideration to methods of increasing the enrolment still further and of decreasing the drop-out rate. The major problems were, first, the inability of some families to afford to keep their children at school for a prolonged period; secondly, the difficulties of providing high schools in thinly populated rural areas; and thirdly, the unsuitability of the curricula and teaching methods of many schools for children of average and below-average intellectual ability. The steady rise in the standard of living gradually reduced the importance of the first factor. The amalgamation of small districts into units of a sufficient size to support high schools greatly improved the provision in rural areas, and a vast expansion of school transport services brought most children within easy reach of a day school. Thus the second factor has also been effectively eliminated. The third will remain for some time as a challenge to educators even in those districts where nearly all the young people continue with full-time schooling at high school or junior college until the age of 18.

The unified school in the Union of Soviet Socialist Republics

What the United States of America and some of the countries of the British Commonwealth had achieved in the development of a unified school system by the early part of this century was the product of gradual growth in new countries which, in many respects, were trying to free themselves from some of the class barriers to be found in the European States. The Union of Soviet Socialist Republics achieved the same result immediately after the October Revolution of 1917 by making a clean break with a system that had been in force in Russia for 90 years. An earlier, but unsuccessful, attempt had been made to establish an *école unique* when, in 1802, the Tsar Alexander I, early in his reign, inaugurated a unified school system which was free, and which provided monetary help for poor scholars.[1] It was abandoned in 1829 by Nicholas I, who designed the two-track system that remained throughout the century. For children of the urban working people there was an eight-year elementary school commencing at 8 years of age, divided into higher and lower divisions of four years each, and followed by technical schools and teacher training institutes. For the upper classes there were *gymnasia* and *real* schools commencing at 10 years of age, the former with an eight-year course leading to the universities, the latter with a seven-year course leading to the higher technical institutes or, if Latin were studied, to the universities also. Both schools were preceded by a one-year preparatory class. In theory it was possible to transfer from the elementary school, but only if the pupil were prepared to lose two years of school life by passing from the fourth class of the elementary school to the first class of either secondary school or from the eighth class to the fourth form of the *real* school. In fact little transfer did take place and the benefits of secondary education were enjoyed only by a privileged minority.

The leaders of the Revolution considered that this dual system of schools was incompatible with their desire to develop a communist society, and they resolved to bring about 'the transformation of the school from an instrument of class domination into an instrument for the complete abolition of classes and for the communist education of society,[2] Lenin was insistent upon the need to develop a school system that would give equal opportunity for every citizen to reach as high a level of education as possible. With a largely illiterate population and few educational facilities throughout a vast area of the Union the Government recognized that such an aim could not be achieved at once; but equally it was recognized that the immediate need was to lay the foundations of a school system whose basic structure was such that it would give every child, no matter what his social background, the same opportunity

1. N. Hans, *Comparative Education*, London, Routledge and Kegan Paul, 1951, Chapter 16.
2. M. Deineko, *Forty Years of Public Education in the U.S.S.R.*, Moscow, Foreign Languages Publishing House, 1957, p. 43.

to develop his potentialities to the full, and that it would be capable of ready extension both in the number of schools and the level of education provided, as fast as buildings could be constructed and teachers trained. In place of the two-track system the unified labour school was created. In its original form this consisted of a first stage of five years and a second stage of four years. In 1923, however, the lengths of these stages were reversed, and the second stage was divided into two cycles, one of three years and one of two years. Each of these stages led directly on to the next. The curriculum was designed as a progressive sequence, and entry to each successive cycle was based upon a pupil's ability to complete the work of the preceding year of the course.

There were thus no institutional barriers to prevent pupils from passing upwards through the whole school system, provided they had the required degree of scholastic ability. The rate of enrolment was limited only by the inherent difficulties of providing enough schools in a vast and sparsely settled land where the provision of education had been so neglected. Great efforts were made to spread the four-year primary school rapidly throughout the countryside, to provide the smaller towns with incomplete secondary school of seven years, and to develop the complete nine-year secondary school in the larger towns. Because the programme of studies for the different grades was the same in all types of school, children could pass from one to another without difficulty should circumstances permit, and the upward extension of the four-year schools and the seven-year schools could be progressively carried out without any gap in the educational process as more buildings and teachers became available.

Such a rapid development of primary education took place in the first decade after the Revolution that it became possible to make the elementary stage of education compulsory, and plans were prepared for the extension of seven-year schooling to all children. In the 1930 Constitution of the U.S.S.R., Article 121, this was written into the fundamental law of the land: 'Citizens of the Union of Soviet Socialist Republics have the right to education. This right is ensured by universal and compulsory elementary education; by free education up to and including the seventh grade. . . .' During the following decade it was possible to make seven-year schooling compulsory in the towns, and the next step was to develop a comprehensive network of seven-year schools to serve the rural areas. By 1940 the seven-year school was to be found nearly everywhere. The havoc of war caused a set-back to the development of universal full-time seven-year schooling, but led to the development of a variety of part-time trade schools and general education schools for young people who had had to leave school prematurely.

Immediately after the war the school entrance age was lowered to 7 and one effect of this was to increase the number of pupils who completed the first stage of secondary schooling. In the next ten years the position was reached at which the majority of young people were completing their seven-year schooling and increasing numbers were continuing their education still further. Seven-year schooling was tending to become the minimum requirement for entry to the trade schools, and so rapid was the increase in enrolments in the full secondary schools (by this time ten-years in length) that universal ten-year schooling appeared to be the next target. Among the directives for the fifth five-year plan, 1951–55, adopted in 1952 by the Nineteenth Congress of the Communist Party of the Soviet Union was the following: 'by the end of the five-year plan the transition from the seven-year public school education to universal secondary (ten-year) education should be completed in republic capitals, cities under republic jurisdiction, province and territory capitals and the large industrial cities. The conditions should be prepared for full achievement in the subsequent five-year plan of universal secondary (ten-year) education in the remaining cities and rural localities'.[1] The corollary of universal ten-year schooling was seen to be the provision of some form of pre-vocational training for all young people in the general secondary school, since only a minority of them would be going on to the institutions of higher learning, and the directives adopted by the congress included the following: 'With the aim of further increasing the socialist educational effect of public schools and guaranteeing to students completing secondary school the conditions for a free choice of occupation, polytechnical instruction should be introduced in the secondary schools and measures necessary for shifting to general polytechnical education should be undertaken'.[2]

In the period for 1950–55 the number of pupils in the general secondary schools more than trebled,[3] and, if all types of senior secondary schools are included, ten-year schooling was rapidly becoming universal.

During 1958 the nature of the education provided in the ten-year general secondary school received much criticism on the ground that it was divorced from life and productive work, as the schools still inclined to see their role as that of preparing students for entrance to institutions of higher learning. Under the reform then initiated, the upper stage of secondary education was henceforth to be provided in a wide variety of types of school, including part-time, which would offer three years of senior secondary education based upon a unified, eight-year general educational labour and polytechnical school. This development will be dealt with more fully in the chapter on the curriculum. What is relevant here is the fact that although the nature and the form of senior secondary education is undergoing changes at present in the U.S.S.R. the trend towards lengthening the period of secondary education for all is continuing.

Stratification of schools in Europe

During the early years of this century, while the United States of America, and a few less populous countries such as Scotland and some of the British Dominions, were developing a high school that would be open to all children, most European countries were adopting a very different approach to the education of adolescents. The underlying assumption in American society was that every person should have an equal opportunity to get on in the world and the schools were used as a means of increasing social mobility. In nineteenth century Europe, on the other

hand, the school system was shaped as a hierarchy of privilege-granting institutions, and the democratic movement in education throughout the nineteenth century and the first quarter of the twentieth century largely took the form of attempts of schools lower down the scale to obtain for their pupils the privileges permitted to the schools above them.[1]

This movement is most clearly seen in Germany. In Prussia, early in the nineteenth century, the State had imposed a centralized control over secondary education and had given the classical *Gymnasium* the sole right to prepare young people for entrance to the universities and the higher positions in the civil service, and had given its students certain military privileges. The State had also laid down a strictly classical curriculum for the *Gymnasium* at a time when research into the natural sciences, history, economics, politics, and modern languages and literatures, was vastly expanding the range and depth of intellectual interests. Increasingly throughout the century the middle classes sought for an education at the secondary level that would more adequately prepare their children for the kind of lives they would lead. To satisfy these demands, the State permitted the increase of different types of secondary school but refused to give them state aid and withheld from them as long as possible the privileges of the *Gymnasium*. But gradually the newer schools achieved a measure of equality. In 1892 the following types of secondary school were officially recognized: the six-year *Realschule*, *Progymnasium* and *Realprogymnasium*, and the nine-year *Gymnasium*, *Realgymnasium*, and *Oberrealschule;* and in 1901 the schools of each of the two groups were given equal status with the others of the same group.

The secondary schools themselves, however, were still quite distinct from the elementary schools. Children entered them at the age of 9 after a preparatory course in the *Vorschule*, and were thus completely separated from children who took the elementary school ladder (*Volksschule*). For these children the four-year *Grundschule* was followed by a further 4 years in the higher elementary school or by a six-year course in the *Mittelschule*, which was established late in the nineteenth century to provide a general and pre-vocational education superior to that given in the elementary school but cheap enough for parents who could not afford to pay for a full preparatory and secondary schooling. The elementary school led children direct to work or to specialized trade training, while the middle school led to intermediate employment in commerce, industry, agriculture, forestry, and so on, or to higher specialized vocational training.

The general position was that even in the first decade of the twentieth century the type and nature of a child's education and his vocational preparation were largely predetermined by the socio-economic status of his parents. His own capacities and interests had little influence on the kind of schooling he was given. Criticism of the system became widespread, being directed against the lack of unity among the kinds of schooling given, against the impossibility of providing a natural differentiation of education in accordance with the abilities of the young people, and against the consequent wastage of talent. The *Einheitsschule* movement, which had begun in the latter part of the nineteenth century with the purpose of providing a common course in the junior classes of the various types of secondary school, extended its aims to include a radical transformation of the school system by providing a six-year common school for all children before differentiation into specialized types of education began. In the ferment that followed the first world war, a few steps towards reconstruction were taken: the *Vorschule* was abolished, and the four-year *Grundschule* was made the common school for all children, irrespective of the social position of their parents. At the end of the *Grundschule* period, or in three years in the case of very able children, selection for the secondary schools and for the middle schools took place. These reforms did much to make it possible for children to be selected for the kind of education best suited to their abilities. However, as fees were not abolished and as many parents could not afford to keep young people away from work, the influence of socio-economic factors upon the kind of schooling followed by the children remained powerful. The practice of remitting fees for able children of poor parents and of making grants towards the maintenance of such children increased steadily after the establishment of the common primary school, and by 1930 approximately one-third of the secondary school population was receiving free tuition.

To make it easier for rural children to obtain a secondary education, a new type of school, the *Aufbauschule*, was created in 1922. It was a six-year non-classical school which pupils entered after having spent 6 years in the elementary school. It proved to be popular, for it corrected some of the faults of early selection. Not only did it provide a second chance for pupils who had failed to obtain a place in one of the other kinds of secondary school at the age of 9 or 10, but it helped those who only at a later stage in their lives showed aptitude for secondary school studies. Its success in rural areas led to its establishment in the cities as well.

During the Nazi régime the school system was greatly simplified by the abolition of all except three of the types of secondary schools. The *Oberrealschule* and the *Aufbauschule*, which placed an emphasis on modern studies, became the main types permitted, while the classical *Gymnasium* was allowed to exist only in the larger cities and for a very limited number of pupils. Little was done to make it easier for children of the working classes and lower middle classes to attend the secondary schools, which continued to enrol only a small proportion of the children who passed through the *Grundschule*. Fees were still charged, scholarships were few, and the curriculum was primarily designed as a preparation for entrance to the universities. The separation between the various types of schools—higher elementary, trade schools, middle schools, and secondary schools—and between the different varieties of schools of each type, remained almost as rigid as ever, and much of the former hierarchy of privilege persisted. There was, in consequence, a steady pressure of pupils to enter the secondary schools, and constant dissatisfaction that opportunities were so limited.

Throughout the present century many German educationists have considered that there would be little chance

1. I. L. Kandel, *History of Secondary Education*. Boston, Houghton Mifflin, 1930, Chap. 7.

of completely escaping from this impasse until a larger period of common elementary schooling could be made general, until much greater flexibility of courses could be brought about, and until transfer from one type of school to another could be made easier. Others, however, have feared that such measures would impair the distinctive quality of the specialized branches of education and would lower the standard of work done in the 9-year *Gymnasium*. To safeguard these values they have tried to make methods of selection as accurate as possible and to find ways of alleviating the effect of errors of selection.

The changes that have taken place in Germany since the second world war have varied greatly, not only as between the Federal Republic of Germany and Eastern Germany, but also as between the different *Länder* in the Federal Republic. In Bavaria, the different types of *Gymnasium* have been modelled upon the *Aufbauschule* in taking their pupils after six years of primary schooling and giving them a seven-year course instead of the traditional nine years. In the city-states of Hamburg and Bremen and in the Western section of Berlin, there has been a marked trend towards multilateral secondary schools. In most of the *Länder* of the Federal Republic, however, the main lines of the old system have changed little. Education has become free, and something is being done to give financial assistance to children whose parents can little afford prolonged full-time schooling. Moreover, transfer from one type of school to another can now more easily be arranged if mistakes in choice of school have been made or if changes in vocational intentions occur, but as the curricula of the different kinds of school are designed as unities such changes always present some difficulty and are relatively infrequent.

In recent years further reforms have been under consideration as a result of the 'Plan for Reorganization and Unification of General Public Schools' proposed in 1959 by the German Council for Education and Culture;[1] but meanwhile the early differentiation of a multiple-track system is retained and the future education and vocational training of most children is largely decided after only four years of primary schooling. Added to this is the fact that about three-quarters of the children begin their direct occupational training by apprenticeship or similar means after eight years of schooling. These two things together have emphasized the importance of accurate procedures for selection and guidance, and since the war a widespread interest in psychological and educational testing has grown up.

From 'scholarship' to 'free place' and secondary education for all

The current interest in testing now being taken by many countries on the European mainland is comparable in many respects with the interest that developed in Great Britain in the decade before the war and in the years immediately following the 1944 Education Act. This aspect of the attempt to base access to the various types of post-primary schooling on the abilities and interests of the children rather than on the social position of their parents is one that has received very careful attention in England, and much can be learned from the diversity of experience of that country.

In contrast to Germany, the State in England entered the field of secondary education only late in the nineteenth century. Until then only endowed schools or privately owned secondary schools existed. In 1864 a Schools Inquiry Commission, set up to survey the existing provision of facilities for secondary education, was impressed by the inadequate number of schools and the lack of consistent standards.[1] It recommended that local authorities should be set up to co-ordinate secondary education in their areas and to prepare schemes for the provision of secondary education where facilities were lacking. It recommended, too, that a central authority should be established to keep a general oversight on the work of the local authorities. No effective state action followed from the work of the commission, but the most important of the private schools themselves set about improving their professional standards. Local authorities on their own initiative began to establish technical and scientific day and evening schools and to provide advanced classes attached to the primary schools for pupils who could remain at school beyond the minimum leaving age but who could not gain access to the grammar schools. Facilities, however, remained uncoordinated, unevenly available, and inadequate. In 1894 the Bryce Commission was set up to report on the best method of establishing a well-organized system of education. It found that while a quarter of the children of all the secondary schools of the country had come from the elementary schools, they comprised only 4 or 5 per 1,000 of the pupils who left these schools each year.[2] In accordance with the commission's recommendations, the Education Act of 1902 set up a central authority for education—the Board of Education—and placed upon the counties and county boroughs the responsibility for making adequate provision for secondary schooling.

In making such provision, the local authorities were expected to take into account the availability of existing schools in their areas. They could make grants for the improvement of local grammar schools which were financed from endowments and fees, or they could establish and maintain their own schools. In the last decade of the nineteenth century and in the early years of the twentieth century the provision of scholarships to existing schools was the chief means used to enable poorer children to get a secondary education. Later, with the increase in the population and in the proportion of children staying at school beyond the minimum leaving age, the local authorities built many new schools and the number of working-class children entering grammar schools steadily increased until they became the largest single group receiving secondary education. However, in comparison with the number of manual workers in the general population their proportional contribution to the grammar schools remained low.

Scholarship pupils from the lower middle class and from the working class generally did well at grammar schools.

They proved that ability was not restricted to the children of the more favoured classes of the community and that their entrance to the grammar schools did not lower the standard of education of these schools. In consequence the view began to be accepted that secondary education could well be extended much further. The report of the Board of Education for 1911–12 had already indicated this in its remark that 'there has been undoubtedly a growing conviction that the value of secondary schools is not limited to children of exceptional ability', and more and more the local authorities sought to increase the number of children entering the grammar schools. The conviction grew that secondary education should be provided for all who were fit to receive it, not just the exceptional children who gained the highest rank in a competitive examination. The concept of 'free places' came to supersede the concept of 'scholarships'. The number of grammar school places was steadily increased, and by the time the second world war began nearly 20 per cent of the children between 11 years of age and the minimum leaving age of 14 were in grammar schools.

For pupils who did not transfer to grammar schools at the age of 11 other kinds of educational provision were developed. A small proportion went to selective junior technical schools, but the great majority stayed in the higher classes of their elementary schools until they went to work. For those who remained at the elementary school beyond the minimum leaving age advanced classes were provided, either as upper divisions of 'all-age' schools or separately in the four-year central schools which were established by many local authorities in order to provide something more than higher elementary education for those pupils who could not obtain a place in the grammar schools. Many of the pupils of the central schools were capable of grammar school work, and though at first their curriculum was biased towards commercial and industrial vocations it tended to become more academic and general. The difference in prestige between the secondary education given in the grammar schools and the general education given in the advanced classes of the elementary schools and in the central schools became a source of anxiety to educators. As early as 1926 the Consultative Committee on the Education of the Adolescent[1] had recommended that after the age of 11 every child should have four years of post-primary education in the type of school that best suited his abilities and probable vocation. The view was becoming general that all education after the age of 11 should be regarded as secondary and should be organized accordingly. The Board of Education accepted in principle the committee's recommendations, but reorganization was delayed by the economic and political difficulties of the decade preceding the second world war. In 1944, however, an Education Act was passed which gave all children the right to free post-primary education, placed all forms of publicly maintained post-primary schools in the care of the local education authorities, and required the local authorities to make adequate provision for at least four years of post-primary education for all children in their areas. In 1947 the leaving age was raised to 15 to ensure that every child received the full 4-year course. Junior secondary education was now universal.

The local authorities were asked to submit to the Ministry of Education their proposals for the reorganization of educational facilities at the post-primary level. The majority, following the recommendation of the Consultative Committee on Curriculum and Examinations in Secondary Schools,[1] decided to retain the basic tripartite division into grammar schools, secondary technical schools, and secondary modern schools. The London County Council, however, convinced by its experience in trying to assess the potentialities of candidates for free places in grammar schools that selection as early as 10 or 11 years of age could not be accurately and justly carried out, and that the separation of children into different types of school at the junior secondary level was undesirable, decided to establish comprehensive schools to which all the children of an area would go. A few other authorities have followed London in this.

Although there has been some unevenness in the provision made by the many local authorities, which faced serious difficulties in carrying out the reorganization at a time when the rising school population placed a heavy strain upon their resources, in general a great advance has been made towards establishing a democratic system of secondary education. There is still dissatisfaction in England with the present position. It is widely considered that even with the best selection procedures a number of children are wrongly allocated each year. To overcome the effects of this, attempts are made to maintain a degree of similarity in the curriculum of the first two years in all kinds of school so that transfer of pupils can take place at the end of this period if necessary. In fact, however, very little transfer does take place, in spite of the known proportion of errors of allocation, for the barriers between different types of school are still formidable. A further attempt to adjust the situation is made by some secondary modern schools by providing grammar school courses for their most able pupils; but while considerable success is being achieved, as measured by passes in the examinations for the General Certificate of Education, the full benefit of working in a grammar school does not appear to be available to the small academic minority in a secondary modern school. Because of such problems as these, more local authorities appear to be turning to the comprehensive school as a solution.

Towards the 'école unique' at the junior secondary level

In Great Britain, where the steady growth of the scholarship and free-place system did much to break down the barriers between the public primary schools and the grammar schools, the demarcation between the primary and the secondary systems was never so sharp as in France, Germany, and other continental European States. In consequence there has not been in Britain a movement to develop a common school system comparable in its single-

1. *Curriculum and Examinations in Secondary Schools*, Report of a Consultative Committee (Sir Charles Norwood, Chairman), London, HMSO, 1943.

ness of aim with the movement towards the *Einheitsschule* or the *école unique*. In those countries where entrance to a co-ordinated state-wide system of secondary schools was based on a preliminary education given in special preparatory schools separate from the ordinary primary schools, the first aim of this movement was to abolish or change the nature of the preparatory schools in order to give all children aspiring to enter the public secondary schools a similar preparation for the entrance examinations.

In the beginning the intentions of the supporters of the principle of the *école unique* were mainly concerned with the problem of access to the secondary schools. They wanted a system that would give every child the chance to have his talents recognized and developed, no matter from what social class he came. In this way, it was thought, the nation would ensure that all its talented young people received a secondary education. The *Vorschule* was abolished in Germany after the first world war, and the four-year *Grundschule* became universal. In France, where a Commission de l'Ecole Unique was set up to examine the matter in 1924, the preparatory classes attached to *lycées* were not abolished, but in 1925 the curricula of the preparatory classes and the primary school were made the same so that all children would have an equal opportunity for five years to prepare for the selection examinations for entrance to the secondary schools. In Austria on the establishment of the Republic in 1918, a more sweeping change was attempted whereby all children were to attend a common *Grundschule* for four years and a *Mittelschule* for four years before being separated into different types of school. After a trial in a few schools the innovation was dropped and the German system of differentiation after the *Grundschule* period was retained.

During the first half of the present century the majority of European countries developed a common primary trunk leading up to a branched secondary school system, although the number of years of primary schooling that most children have had before entering the secondary schools has varied from four to six, and the normal age of transfer has varied from 10 to 12. Since the second world war there has been a movement in many countries to increase the length of the period of common education, i.e., to extend the *Einheitsschule* or *école unique* upwards through the period of higher primary, lower secondary, or intermediate education. The movement is an expression of the importance now being placed upon giving a longer general education to all young people, and this aspect will be dealt with later. It is also another aspect of the effort to make an accurate and just allocation of pupils into the different types of higher school. It is this further aspect of the striving for equality of opportunity for all young people to develop their talents that will be considered here.

The problem itself, and the difficulties attendant upon its solution, can be seen very clearly in the various attempts that have been made in France over the past 20 years to reform the first cycle of its system of secondary education. The beginnings of recent attempts at reform go back to 1937, when direction-finding classes (*classes d'orientation*) were set up in some of the *lycées* in order to help pupils to make a better choice of their subsequent course of secondary schooling, but the idea of making this general for all children in the primary school received a major impetus from the reports of the two Commissions d'Etudes de la Réforme de l'Enseignement that were set up immediately following the second world war. The first, the Algiers Commission, reported in 1944; the second, the Langevin Commission, in 1946. The Langevin report envisaged two phases of secondary education, which would commence at the age of 11 years after the completion of primary education. The first phase, which was termed the *cycle d'orientation*, was to last for four years and was to be open to all children. It was to comprise a common core of general studies together with some optional specialized studies, and its main purpose was to be the exploration of the aptitudes and abilities of the pupils so that the subsequent course of differentiated education could be widely chosen by the young pupils, their parents, and their teachers. The second phase was to be a three-year *cycle de détermination*, either full-time or part-time, devoted to specialized vocational training or preparation for the institutions of higher education.

The recommendations of the Langevin report were too drastic and far-reaching to be immediately acceptable, but they profoundly affected the subsequent thinking of educators both in France and elsewhere, and several measures have since been taken in the direction proposed. A major advance was made in 1946 by converting the *écoles primaires supérieures* into *collèges modernes*. This gave them secondary school status, and emphasized the idea that the primary phase of education ended for all children at the entrance to the sixth class.

The *classes nouvelles* that were formed in a number of *lycées* in 1945 provided an opportunity for experimentation with orientation procedures, activity methods and optional subjects, and for their general value to be assessed. Although these classes were given up in 1951, when they numbered 800, the experimental findings were spread widely throughout the junior forms of the secondary school and a few *classes pilotes* continued the work of experimentation. In 1949 a proposal for instituting a common two-year period of orientation was put forward, but it was not approved by the Conseil Supérieur de l'Education Nationale. Since then several further attempts to evolve an acceptable plan for reorganization have been made. A *comité d'études* headed by Jean Sarrailh drew up proposals for a three-year period of *enseignement moyen* in which there should be a common programme together with optional subjects taken according to the aptitudes and tastes of the pupils. In 1956, after a change of government, a new reform proposal was made; it reduced the orientation period to two years, but emphasized the importance of a common period of education in the first phase of secondary schooling by envisaging the establishment of separate *écoles moyennes*, not only to enable all pupils to make a wider choice of subsequent education but also to extend upwards the period of general education for all. The proposal to establish *écoles moyennes* was, however, regarded as too costly to be acceptable.

In 1959 the Government passed a law that embodied a considerable measure of reform. The school-leaving age was to be raised to 16 years, so that every child would have at least four years of junior secondary education. At the age of 11 the pupils of the primary school were again to be allocated to different types of secondary school, but the curriculum of the first two years in these different schools

would be very similar for all, and this two-year period would be especially devoted to the exploration of the children's aptitudes. At the end of this period the school would advise the parents on the best form of continued education for their children. The kinds of secondary school were to be: *lycées*, both classical and modern to give a general education leading up the universities; *lycées techniques*, to give a general and technical education also leading to the universities and institutions of higher technology; *collèges d'enseignement technique* (the old *centres d'apprentissage*), to provide a shorter technical education and trade training to those who would then go to work; and *collèges d'enseignement général*, which would be the old *cours complémentaires* and would conclude the general education of those pupils who intended to leave school at 16 years. In order to facilitate transfer from one type of school to another after the two orientation years, special adjustment classes were to be set up.

It was recognized that there would be many difficult problems to be solved when the specialized teachers of different kinds of secondary school were expected to teach a common curriculum and provide the guidance upon which their pupils' subsequent schooling might be based. There has been a rapid development of educational and psychological research in France in recent years and an expansion of psychological services to schools. This development, together with the British experience, has made French educators profoundly conscious of the need for a fairly lengthy period of exploration and expert psychological assistance before far-reaching decisions affecting the child's future are made, and it is possible that the unification of schooling in the *cycle d'orientation* may be carried even further in the future.

The 'enhetsskola' of Sweden

One of the most carefully prepared changes in the direction of the *école unique* is that which is now being made in Sweden.[1] The public school system that evolved in Sweden during the second half of the nineteenth century and the first quarter of the twentieth century was characterized by a variety of types of school. The primary school could be a six-, seven- or eight-year school, according to the district in which it was found, and a pupil who wanted education beyond the primary level could transfer to a five-year *realskola*, after completing four years' primary study at the age of 10 or 11, or to a four-year *realskola* after six years of schooling at the age of 12 or 13. To prepare for the university he could then transfer to a three- or four-year *gymnasium*, and to prepare for intermediate occupations he could specialize in commercial or technical subjects during the last two years at the *realskola* or he could attend the *praktiska mellanskolor* that were to be found in the larger towns. Pupils who did not enter these forms of secondary school would attend a continuation school for one or two years after completing the basic *folkskola* course and then could enter vocational schools.

With the lengthening of the compulsory leaving age to 14 years, which was gradually brought into force in most school districts between 1936 and 1940, and with the prospect of an upward extension of leaving age as more and more children were voluntarily staying at school for a longer period, the vertical separation of schools that began from the age of 10 gave rise to dissatisfaction. In 1940 a committee of educationists was set up to study the organization of the school system, and in 1946 its work was supplemented by a lay committee representing the political parties of the Swedish parliament. As a result of these studies it was decided to bring about a radical change in the school system.

The Swedish School Reform Act, passed in 1950, provided for the establishment of a nine-year compulsory comprehensive school (*enhetsskola*) designed to replace the elementary school, the continuation school, the higher elementary school, the municipal middle school and the lower secondary school. The *enhetsskola* was to take pupils from 7 to 16 years of age, and its course of schooling was to be divided into three stages: a junior section with classes 1 to 3, a middle section with classes 4 to 6, and a senior section with classes 7 to 9. By means of a long consecutive course of compulsory subjects the nine-year school would, it was hoped, satisfy the need for a better general education for all pupils. By means of the gradual introduction of optional specialized subjects, culminating in the organization of separate divisions in the ninth class, a more rational vocational and educational guidance could be given. Moreover, the child's future education and occupation would stand a better chance of being based upon his own abilities and interests than it was when a premature choice of differentiated schools had to be made that was greatly influenced by socio-economic factors.

The 1950 Act expressly provided that the development of the *enhetsskola* should be carefully guided in the light of experimentation into such problems as the best curriculum and methods to use in a comprehensive school, the differentiation of courses of study and methods according to the varying abilities of the children, and so on. Experimental schools were set up in certain municipalities and procedures were devised so that their work could be carefully watched by the Board of Education and their experience spread throughout the school system. Impressed by the success of the experimental work, the Government agreed that the *enhetsskola* should definitely replace the older organization of schools, and in 1957 it decided that the general introduction of the new form of organization should begin everywhere between 1963 and 1969. Until the reorganization is completed provision is to be made for nearly all children in the three-year *realskola* when they have completed a six-year primary school course, though the four- and five-year *realskola* is expected to remain in existence as well for some time. The *enhetsskola* will lead to a three-year *gymnasium*, preparing students for the university and for various types of institution for higher specialized vocational training. At the present time the *gymnasium* in most cases still has the *realskola* attached to it.

In 1959 the Danish school system, too, was reorganized to provide a seven-year unified primary school leading to a three-year *realskole*, from which, in the second year, academically able pupils will transfer to the *gymnasie* which prepares for the university.

1. Ingemar Düring, ed., *The Swedish School Reform*, 1950, Uppsala, Appelbergs Boktryckeriaktiebolag, 1951.

Conclusion

Summing up, it can be stated that since 1930 there has been remarkable progress in the extension of opportunities for secondary education. In the least advanced countries access to secondary education, even if only for a minority of scholastically able pupils, is now being provided where before there were no facilities at all. It is recognized that much remains to be done even to provide for the best intellects, and it is known too that social and economic factors still play a large part in determining which of a country's able children will be fortunate enough to be selected. Yet a beginning has been made, and almost without exception the newly constructed or reconstructed systems of education in the less advanced countries have avoided the two-track public school system which the European countries struggled so long to break away from. Now it is steady quantitative growth that the underdeveloped countries most need.

One of the last countries to achieve a single-track elementary school was Egypt, and it is of value to note the way in which in the space of less than two decades the new system was established.[1] Almost as late as 1940, Egypt still had a dual system operating throughout the period of childhood. There were 'elementary' schools, which were attended by most of the children, and there were 'primary' schools for a minority. The primary schools charged fees and prepared children for entrance at the age of 12 to the secondary school and then to the modern university; the elementary school led to trade-training schools, commercial schools, agricultural schools, or to the Al-Azhar University, which was directed towards mastery of Arabic and the Koran. The primary school taught a foreign language from the outset, the elementary school not at all. The task of bringing these two types of school together was begun in 1938 with the postponement of the study of a foreign language until the second year of the primary school, and in 1945 until the third year. This made it possible for the elementary school child to change over up to the age of 10 years. In 1944 fees for primary education were abolished, and in 1945 the elementary child was allowed to sit for the Primary School Certificate and was exempted from the foreign language requirement. Thus secondary education was opened to the elementary school child. In 1950 a common syllabus was adopted for the two schools, except for the teaching of a foreign language from the third year of the primary school. In 1951 when the six-year school was made compulsory the foreign language was introduced at the fifth or sixth year for all schools, and the single track system was complete.[2]

The more advanced countries have now reached a point at which almost all their children are at school until 15 years of age, and in most cases the last three or four of these years are regarded as comprising the first stage of secondary education. Moreover, in every country in the world now the public primary school system is an *école unique* leading directly to the public secondary system, although the length of the common trunk varies greatly from countries like the Federal Republic of Germany, Spain, and Venezuela where it is only four years (from the age of 6 to 10), to countries like Canada, New Zealand, and the United States of America where the whole system is unified and where in effect it lasts 11 or 12 years from the age of 6. The most frequent length for the common trunk today is six years and in only about a quarter of the world's systems is it shorter than this. Furthermore, the tendency seems to be towards a lengthening; from which it can be seen that structurally the world's systems are now much better designed than formerly to minimize the denial of opportunity that occurs when a premature choice of specialized schooling is determined by factors that are unrelated to the child's own abilities and needs. Such factors, of course, still operate, although the more obvious effects of differences in wealth, class, caste, religion, and race upon the restriction of educational opportunity are steadily being minimized. Two other fields of inequality cause persistent problems however, namely, the provision of schooling in rural areas, and the education of girls.

2. Since the Law of 1953 no foreign language has been taught at primary level in Egyptian schools.

RURAL SECONDARY EDUCATION

Rural areas are always difficult to provide with educational services, and especially so in the matter of secondary education. In only a small fraction of the world's rural areas do children yet have ready access to education. Villages are often too small even to support a primary school, and many children live in isolated farms a long way from a village. The children of the wealthier families have customarily been sent to boarding schools in towns, but the children of the poorer families commonly obtain no more than an incomplete schooling and therefore would not be qualified to benefit from secondary education even if provision could be made for them. One of the major obstacles to the extension of secondary education in the remoter rural areas has been the sparseness of settlement.

The provision of scholarships and bursaries to enable children of ability to live away from home and board at a secondary school is one of the commonest methods used in the early stages of providing extended education for rural children, especially prior to the growth of efficient transport services between villages and nearby towns. In most countries of the world there are secondary schools, either publicly or privately established and controlled, that have boarding establishments attached to them. Some, indeed, have consisted entirely of boarders and have developed a characteristic form of schooling. The famous English 'public schools', for example, went much further than merely having boarding establishments attached: they organized their school life around the various 'houses', each of which with its house-master and matron constituted a circle of community life within the school. In other countries, however, even those that derived their secondary education systems primarily from England, this method has not often been followed, and the more common pattern is to have day schools with an attached boarding establishment for a proportion of their pupils. In recent years countries as different in their background and educational provision as Afghanistan, Bulgaria, Ceylon, Italy, Japan, Norway, Rumania, the U.S.S.R. and

Viet-Nam have done much to help their most isolated children by establishing residential schools and by attaching dormitories or hostels to existing secondary schools.

The provision of scholarships to enable able but poor pupils to be entirely maintained in such schools has, in the past, been rather more often made by philanthropic bodies and religious organizations than by the public authorities, which in the main have restricted themselves to making payments that help country parents to board their children in towns but do not meet more than a part of the total cost. They have therefore still tended to remain more readily accessible to children from the richer homes. Italy provides a good example of a country in which a complex system of scholarships has been built up through the voluntary efforts of private individuals, philanthropic foundations, local authorities, trade unions, professional associations, and commercial and industrial enterprises. For the most part these are open to competition by children who have shown high intellectual promise but who live in rural areas where no facilities for secondary schooling exist. Matching private generosity, the Government in recent years has allocated a considerable sum of money to the provision of boarding scholarships. In Ceylon a large number of special science scholarships are awarded annually on a competitive basis to pupils in schools that do not have adequate facilities for teaching science. The scholarships are tenable in central schools taking the pupils up to the standard of university entrance, and they provide the students with free board and lodging as well as free tuition.

Several of those countries that administer non-self-governing dependencies or that have the responsibility for the care of United Nations Trust Territories have been making similar provision at the secondary level for selected children from areas lacking educational facilities. In Western Samoa, for example, and in other islands of the South Pacific area, it is usual for such children to board with relatives who live in a town, and boarding bursaries are paid to the persons who have the children in their care. In some areas the children go to other countries. For example, the Australian Government has for some time provided scholarships and bursaries to enable selected children from the territories it administers to board in Australia while attending high school.

Provision of this nature can cope with only a small proportion of the children of secondary school age, and is not a permanent solution to the problem. One immediate advantage is that it sends back to their respective communities educated young people who will form the nucleus of a body of teachers and technical assistants and help to develop local facilities for education. In underdeveloped countries the provision of local secondary schools is the next task to be undertaken. In many predominantly rural countries, primary schools have initiated this phase by extending their courses upwards to offer higher primary education and even complete secondary education to their most able pupils; with increasing population, these primary school 'tops' then usually become separate secondary schools. In earlier times this process could be more satisfactorily organized than it can today, for before the rise of modern technological civilization the secondary school curriculum was mainly of a literary nature and neither teacher nor learner needed much equipment other than the teacher's own books. The difficulties of adequate provision for modern subjects are crippling the efforts of rural primary schools to supplement the education of their senior pupils. Such arrangements are worth studying carefully, however, as in spite of their inadequacies they still have a contribution to make in the most difficult areas.

Scotland is a notable example of a country which, very early in its history, made provision for a grammar school education to be given in the village school for even a handful of pupils if they showed themselves to be scholastically able,[1] and the influence of Scottish settlers in many of the British colonies could be seen in the attempts of village schools to provide a complete education at least for the intellectually able minority. In New Zealand, for example, what were called 'district high schools' increased rapidly in number from the beginning of the present century.[2] They were essentially graded primary schools for children up to the age of 13 or 14, which then provided secondary classes up to the university entrance examination level. Their curriculum was necessarily bookish, for the one or two secondary school teachers on the staff would almost certainly be university graduates in literary and humanistic subjects, and even if they were science graduates their teaching equipment would be of a rudimentary nature. Moreover, with the whole range of secondary work in their care, they would have little time to devote to the laboratory or the gardens. However, they were remarkably successful in bringing secondary education of the traditional type within the reach of most rural children. In some of the provinces of Canada, such as Ontario and Saskatchewan, a development similar to that in New Zealand took place; and in quite different circumstances, Bermuda has retained until the present day a form of complete primary and secondary school that in essentials goes back to all-age parish schools, very similar to the early Scottish schools, that were founded in the colony in the nineteenth century.

Other countries, like Austria, Ecuador, Finland and Uruguay, have provided higher continuation classes in some of their more isolated primary schools, but only rarely have attempts been made to give a complete course of secondary education in such circumstances.

Many different means have been adopted to alleviate the inadequacies of the small rural high school or primary school with secondary classes attached. Itinerant instructors of special subjects like agriculture, woodwork and cookery, have periodically visited such schools to take classes. Correspondence courses have been used to supplement the work of teachers in subjects of which they knew little, and under the supervision of their teachers the few pupils involved could undertake their own study. More recently the radio brought a new device to help the teacher. The inadequacies of such schools remained, however, and it awaited the evolution of modern transport to bring to rural children secondary schools as well equipped as those of the cities. Now, with the provision of secondary facilities suited to a wider range of the abilities than could be

1. Newman A. Wade, *Post-Primary Education in the Primary Schools of Scotland (1872–1936)*.
2. Alan H. Thom, *The District High Schools of New Zealand*, Wellington, New Zealand Council for Educational Research, 1950.

catered for by the 'literary' type of rural high school, there has occurred a vast increase in the proportion of country children taking advantage of secondary education.

The most important factor, therefore, in the expansion and improvement of the past 30 years, has been the improvement in ways of communication and means of transport. Good roads and modern techniques, by opening up areas of farmland and simplifying marketing have brought increased prosperity, allowing children to be freed from home labour for longer periods, and enabling them to go several miles by cart, bicycle, or motor car to a centrally placed secondary school. State monetary allowances to help pay for the maintenance of private means of conveyance and reduced fares on publicly owned vehicles were provided in several countries in the earlier part of the present century, but the provision of special school bus services is gradually superseding the more empirical arrangements. In the United States of America, where a widespread network of school buses was developed comparatively early, about one-third of all pupils, primary and secondary, rural and urban, now travel by school bus. In Australia, Canada, France, Japan, New Zealand, Norway, Poland and several other countries, school buses running daily to rural centres of secondary education are each year increasing the proportion of country children for whom a secondary education is as accessible as it is to town children.

At the same time there are many areas in the world where such facilities will long remain poor. Isolated villages in difficult terrain are found in countries as diverse as Albania, Italy, Turkey, and Viet-Nam, to take a few examples, and these will be difficult to serve by convenient means of transport. There are other hindrances, too. In some parts of Pakistan, for example, the provision of centralized educational facilities has to take account of the influence of ethnic, religious, and linguistic differences among neighbouring communities. In such circumstances, scholarships for potential leaders to attend secondary schools and institutions of higher learning elsewhere seems the most practical step that can be taken, and it is one that will help to change the attitudes of the different groups one towards the other as their leaders gain more knowledge and appreciation of the whole nation in which their people are called to play an effective part.

The unwillingness of small local communities to combine their efforts in order to be able to provide better educational facilities for their children is, of course, not confined to the type of local difficulty characteristic of underdeveloped countries. In the United States, where the responsibility for the provision of schools was originally vested in the small school district, local feeling often hindered the development of secondary education in rural areas. School districts might be too small and too poor to be able to establish and maintain secondary schools, yet at the same time they might be so determined to maintain their own identity that they would not amalgamate with others to create the larger and more effective districts. The general trend, however, has been towards the consolidation of school districts, the building of central schools, and the provision of school bus services. This trend has transformed the rural school and has brought secondary education to nearly every country child.

ACCESS OF GIRLS TO EDUCATION

One of the striking achievements of the present age has been the progress made by women towards social, political, and economic equality with men. Parallel with this has been the achievement of the right of access to schools and universities, the right to obtain certificates of school attainment and university degrees, and the right to enter professions requiring advanced education. At the present time the educational legislation of almost all countries of the world recognizes, either explicitly or implicitly, the right of both girls and boys to free and compulsory primary education, and only in rare instances is the duration of the compulsory period different for the two sexes. Equality of access to the non-compulsory secondary stages of education, too, is almost universally accepted as a right, and during the present century in all countries where secondary education systems have been growing steadily one important factor in their growth has been the increasing proportion of girls in attendance.

Nevertheless, there are still differences in the degree to which girls receive education beyond the compulsory stage. In a few areas such as the industrialized countries of Europe, the United States of America, and some of the older self-governing countries of the British Commonwealth such as Australia, Canada, and New Zealand, the number of girls enrolled in general secondary schools is approximately equal or even greater than the number of boys. On the other hand, in some of the underdeveloped regions of the Middle East, Asia, Africa, and South America, there are countries where the overwhelming majority of pupils in the general secondary schools are boys. There are no cases where extreme differences in the opposite direction are found. If we consider the position in respect to the vocational education of boys and girls at the secondary level in countries where separate schools exist for such training, there appears to be an even stronger tendency for more boys than girls to be enrolled. Even countries that have almost equal numbers in their general secondary schools tend to have more boys than girls enrolled for vocational training, although there are a few instances where the opposite is true; and in those countries with a relatively small number of girls in general secondary schools there is usually an even smaller proportion in the vocational establishments. If both these tendencies are taken into account it is clear that in terms of the world population, girls are still far from having an equal share of educational facilities at the secondary level, and at the level of university education the difference is even greater.

The main factors which tend to restrict the education of girls are social and economic ones that vary considerably from country to country. Opportunities for paid employment in occupations that call for a high level of general education or advanced technical training may be much fewer for women than for men. Unfavourable attitudes still exist in some countries concerning the practising of the learned professions by women, or their promotion to executive positions in industry and commerce. Furthermore, the prospect of marriage and the responsibilities of home-making cause many girls to reject the thought of preparing for a career that involves prolonged training, and leads them to drop out of school early to take up

interim employment. The economic position of their families, too, is an important element in the situation. Even where secondary education is free, or where the fees are quite low, it is difficult for the poorer families to maintain their children throughout the adolescent years, and the boys may be kept at school preparing for more highly paid employment while the girls leave school and go to work early.

On the other hand, it would appear that such factors are being counteracted by recent technical and economic changes that are having their repercussions everywhere. The need for trained human skills and developed general ability is increasing at a rapid rate, and is bringing such a demand for well-educated human beings that the resources of both sexes may have to be drawn on to the full. The second world war showed that women could do work hitherto thought possible only for men, and recent technological advances are increasingly calling on their services. This is true not only of the industrialized countries but also of many underdeveloped areas. In the latter the problem of an adequate supply of educated people is so acute, that since only the more accessible regions can be as yet provided with schools, it is recognized that those that can be maintained should educate as many able young people in their areas as possible, girls and boys alike, and that in many cases this can only be achieved by drawing upon the resources of both sexes.

POLICY AND ADMINISTRATION

The changes that are being brought about in education today are affecting the machinery of educational administration and even the policies of governments. Three aspects, in particular, are worth noting here. First, there is an increasing recognition that education, even at the secondary level, is a major responsibility of the public authorities; secondly, there is the realization that the old machinery of administration may be inadequate to its new tasks; and thirdly, with the growing appreciation of the developmental role played by expanding educational services in the economic life of a nation, there is an increasing tendency to consider the part to be played by education when economic development plans are being drawn up.

The increasing responsibility of governments

Among those countries of the world that have had well developed systems of education for a long time there have been great differences in opinion as to who should bear the responsibility for the founding and maintenance of schools. In Europe, since medieval times religious authorities have played an important part at all levels of education from the parish schools to the cathedral grammar schools and the universities, and secondary education owes much to the early work of the churches. They played an important role, too, in bringing the first conceptions of Western education to the rest of the world, for in the wake of all the great colonizing ventures of the European nations from the fifteenth century onwards missions were established, which, although their main purpose was to proselytize, devoted considerable effort to the promotion of education. During the sixteenth century, institutions of higher learning, including universities, were established in Latin America, and right up till the present time mission schools have continued to be founded in remote and underdeveloped parts of the world. Other organized groups of people such as guilds of merchants and artisans, municipal councils, philanthropic associations and scientific societies, also entered the field of education, catering for various needs as they were experienced by their members.

In the European countries themselves, however, and in those of their colonies in which the European settlers became numerous, the voluntary associations were unable to keep up with the demand for educational facilities caused by the social, political, and technological changes that science and industrialization, political nationalism and independence, brought with them.

In recent times, therefore, particularly from the beginning of the nineteenth century, the major responsibility for education has gravitated to the principal organs of government, and the greater part of the educational provision to be found today is made through public schools, that is, schools owned and controlled by statutory authorities representing and acting on behalf of all citizens of an area, not just of a section of them. France, Germany, and Russia were developing state secondary school systems at the beginning of the nineteenth century and one by one other countries followed their example. In Great Britain the central government did not enter the field of secondary education decisively until 1902, when it legislated to make city and county councils responsible for the provision of adequate facilities for secondary education throughout their areas. In the present century the activity of the government in education has been increasing everywhere, and in the newly created independent States and States experiencing a national resurgence the government responsibility for education is accepted. The basic reason underlying the rise of governments to the predominant position they now occupy in education is that they alone have been able to command the resources needed to create and sustain the extensive system systems needed for the maintenance and improvement of civilized communities. Even if the State does not itself provide all the educational services but recognizes the right of voluntary organizations such as churches to have their own schools, it usually takes the responsibility for seeing that these voluntary bodies achieve the standards it requires in buildings, in the training of teachers and in the curriculum, and in many cases it provides financial support.

In recent years, many different patterns of relationship have developed between governments and voluntary bodies, usually the churches, in the provision of educational facilities. At the one extreme there are countries like the U.S.S.R. and Czechoslovakia, where all schools belong to the State and no private schools are permitted. At the other extreme there are countries like the Netherlands, where Catholic, Protestant, and state school systems exist side by side, all maintained by the Government. Between these extremes there are various degrees of state encouragement, support, and control. In Burma, churches are free to set up schools but they receive no state assistance; in New Zealand no financial help is given for the salaries of

teachers or for the erection and maintenance of buildings, but there are many other forms of aid such as free textbooks, subsidies for teaching equipment, provision of access to state manual training centres, sharing of state school-bus systems, and so on. In many Latin-American countries and in many former European colonies in Africa and Asia where the modern education system had been started by churches, the church schools have been granted financial assistance, subject to governmental supervision of their work; and in France a law was passed in 1959 making it possible for financial assistance to be granted by the Government to the church schools. It is clear, however, that the main trend has been towards the State's acceptance of full responsibility for seeing that adequate educational facilities exist, and that the major provision for education today, when all levels and types of education are included, is being made by the State itself, through its own organs of government, both central and local.

An important factor helping to bring about this trend has been the rise in the cost of education in recent years, which has placed a great strain upon the resources of all voluntary bodies undertaking to provide schools. There have been several reasons for this rise. First, during the latter half of the nineteenth century and throughout the present century, there has been a growing need for technical education, and technical education with its expensive equipment has usually been beyond the power of the voluntary bodies to provide. Church authorities in most countries have found it difficult to provide adequately for science teaching or for arts and crafts, except in a small proportion of their secondary schools, and they have preferred to concentrate upon the literary and humanistic disciplines. In underdeveloped countries the gap between their immediate needs and the educational services supplied by private schools is now beginning to be felt seriously, and governments are taking the responsibility for the establishment of technical schools and trade training centres. Secondly, with the prolongation of schooling, the percentage of senior pupils in the secondary schools is steadily increasing, and senior pupils cost more to teach than juniors; they require more highly qualified staffs, a lower pupil-teacher ratio, and more expensive equipment and buildings. When only a few pupils attended secondary schools as compared with primary schools, the voluntary bodies could provide enough secondary schools for those children who wanted places in them; with the growth of universal secondary education they cannot keep up. Thirdly, there are the great increases in special educational services: school psychological services, educational and vocational guidance services, special schools for handicapped children, transport services, and a number of other expensive adjuncts to the modern school. Finally, there is the training of teachers. Although in some countries, such as England, there are many teacher training colleges controlled by churches, their contribution has been overshadowed by the great increase in public institutions set up to cope with the post-war rise in the school population.

It is the realization of the weight and significance of factors such as these that has led more and more countries in recent years to set out explicitly in their constitutions or fundamental laws on education the duty of the State towards the education ot its people. All countries give recognition to the need for education. Some, like Czechoslovakia, express it simply and directly in their constitutions as a right of citizenship: 'All citizens have the right to education'. The Islamic countries view it rather as a religious obligation to ensure that all human beings are educated. In whatever way the right is expressed, however, there is general agreement today that every person should have a free and compulsory primary education, and that all should have the opportunity of such higher education as they are capable of profiting from. But it is one thing to recognize a right; it is another to ensure that people get their rights, and this is where the modern State has taken its characteristic stand. In every country it is now recognized that it is a major function of government to guarantee the citizens their right to education. In some countries the State itself provides all educational services for its citizens. This is the case in Czechoslovakia, the U.S.S.R., and most of the other Communist countries. Elsewhere the State recognizes its obligation to ensure that children are educated, but does not set out to provide a complete educational service itself. The State may leave a wide field open for private action, and express its obligations as does the 1946 constitution of Ecuador: 'The education of children is primarily the responsibility and prerogative of their parents or of those representing them. The State shall ensure that such responsibility is discharged, and shall facilitate the exercise of that prerogative'. Or it may take the main responsibility for providing educational services, while at the same time leaving other bodies the right to make alternative arrangements if they wish. This is the position in the United Kingdom, the United States of America and most countries of the world today.

But whatever the different allocation of power and responsibility for the provision of educational facilities, the fundamental trend during the present century has been towards an explicit recognition that the final responsibility rests with the State to ensure that the educational needs of its citizens are met.

The locus of government action

The administration of modern States is almost invariably carried out by a complex network of local, regional and national authorities; it is a blend of centralized and decentralized power and responsibility. Especially is this so in respect to services which, like education, touch citizens directly and personally. The precise degree and nature of responsibility borne by the local and the national or regional authorities varies from country to country; and as the allocation of such powers has usually been based upon the political and economic needs of communities rather upon their educational needs, the provision of educational facilities has rarely benefited from a form of administration expressly shaped to serve educational purposes. A great deal of the energy of educators in recent years has gone into a struggle to make old machinery responsive to new needs, and one of the trends of the past few decades has been the search for that blend of local and central powers that best suits the present educational situation in a particular country. In this search, the newly developing States have been in a somewhat better position

to choose rationally than have the other States which entered the present era with firmly entrenched administrative structures. Among the older developed countries, two extremes of control may be seen, and it is instructive to study their characteristic advantages and disadvantages.

On the one hand there are States like Canada, the United Kingdom, and the United States of America where, throughout the modern era, local communities have borne great responsibility for the founding and maintenance of schools from money raised from their own local resources and for the control, direction, and supervision of the process of education by their own elected representatives on town and county councils, school boards and school committees. Such extreme decentralization has had many advantages: it has given flexibility to the development of educational services, enabling them to meet local needs as and when these have been clearly perceived; and it has led to the provision of a wide variety of educational services, the resulting emulation proving a stimulus to change and improvement. But it has also had grave defects, and in recent times these have grown to such serious proportions with the changed needs of education that the ultimate source of supply and control has been steadily vested in authorities representing wider and wider sections of the community, from the town to the county, from the county to the province, and from the province to the federal government.

Disparities in the wealth and consequent ability of different local districts to build schools and employ teachers led to the centralization of educational finance in New Zealand in 1877. In England and Wales it led to the measures which have been taken since 1902 to increase the amount of financial aid for secondary education given to local authorities by the central government and to develop the role of the latter in co-ordinating the efforts of local authorities. In the United States of America the support of the states to school districts has been increasing steadily in recent years, and in 1959 federal aid, which had been available for many years for the purpose of fostering vocational education, was extended to other educational programmes. The local areas controlling schools have also tended to merge into more powerful units. This process is very well illustrated by the movement for school district reorganization in the United States. There the state governments bear the main costs of education, but the local school districts, of which there may be several thousand in a state, decide on the raising of local money, the kind of buildings to be provided and their location, the employment of teachers, and the kind of educational provision to be made. The resources of the local school district, therefore, play a large part in determining the nature of the educational facilities made available to the children. Few school districts in the rural areas are capable of providing adequate secondary schools, and over the whole of the United States in the last 20 years there has been a steady reorganization of small districts into larger ones. The concept of a 'community school district' has developed in many states; this is a district comprising a small town or village and the neighbouring rural area for which the town is a sociological centre. In other states, the administrative county has become the wider unit. Whatever the form of reorganization, however, the general result of the abandonment of extremely decentralized control has been to improve the quality of the schools that could be provided.

On the other hand, there are European countries, like Belgium, France, Italy, and Spain, and some Asian States, which entered the present age with highly centralized administrative machinery, and this has enabled them to spread a system of education fairly evenly; but at the same time centralization has tended to inhibit or delay the development of local institutions suited to particular local conditions, and in some places has even led to the neglect of the less accessible rural areas. To remedy such deficiencies many of the centralized States have been trying in recent years to find ways of devolving some power and responsibility to municipalities and regions. This is an even more difficult task than the reverse process, for the smaller communities in a State that has been centralized for a long time do not have citizens with the experience of responsible corporate decision-making at the level required for the proper control of school systems.

Several useful examples of the devolution of powers are to be found in recent developments in France: experimentation with activity methods, with new techniques of orientation, and with freedom to devise new curricula, were carried out for several years in the *classes nouvelles* established by the Ministry of Education in many secondary schools from 1947 onwards; a comprehensive system of vocational and technical schools has been established by the municipality of Paris; considerable freedom is now being permitted to district committees to advise on the allocation of pupils to the different types of secondary school available in their areas, and the decision as to the number and kinds of new secondary schools to be provided in the different districts is now the responsibility of local commissions.

In countries that have only in recent years begun to organize modern education systems or even to establish themselves as States, there is a definite trend towards devising a system suited to their own particular circumstances and aims. Even where States at first may have borrowed heavily from an older country with which they had cultural or political ties, as in the case of former colonial territories now becoming independent, a pragmatic reconstruction of the organs of educational administration is going on, as they are increasingly finding themselves able to take account of their own circumstances and to free themselves from forms of administration handed down to them from other times and other places.

In these respects, the present years are years of experiment and transition, and it is too soon yet to discern whether there is any particular pattern of local and central control that has more than a provisional validity for educational administration.

CHAPTER VI

THE TRANSITION FROM PRIMARY TO SECONDARY SCHOOL

The trend to open up facilities for secondary education to all children in the community leads to a changed conception of primary and secondary education. In place of the idea that a system of elementary education is something complete in itself, provided for the masses of children who will go to work at a comparatively early age, while the secondary system, also complete in itself, is for those who will have continuous education right through the university years, the view arises that primary education is just the first phase of a continuous process, and that secondary education is the middle phase, to be followed by university education or advanced vocational training and adult education. As we have seen, this idea had been accepted in the United States of America by the first decade of the present century. It is true that only a small proportion of children did in fact complete the full course of primary and secondary education at that time, but this was not the result of any structural fault in the system itself, but rather of the limited nature of the curriculum and of socio-economic factors beyond the control of the school system. At the same time, educational administrators in England and certain of the British dominions overseas, such as Australia, Canada and New Zealand, had conceived the same ideal. Robert Morant wrote in the report of the British Board of Education for 1908/9: 'The idea that elementary and secondary schools represent not successive stages of education but alternative kinds of education meant for different social classes is deeply rooted, and may be said to have dominated practice until recently'.[1] This was written only a few years after the Education Act of 1902 had placed upon the local authorities the responsibility for ensuring provision at the secondary level for able pupils from the elementary schools. So far as practice went, the bridge had just begun to be built. In New Zealand the 1902 free place regulations were having the same effect. This new conception of the relation between primary and secondary education spread slowly but steadily, and since the second world war the articulation of primary with secondary education has occupied the attention of most countries of the world. There has developed the ideal of a continuous process of education that gradually changes as the child grows and becomes mentally more mature, and gradually differentiates as the child's interests take a more permanent form and differences in his aptitudes and ability manifest themselves and call for special attention.

All countries, even those that are starting from the beginning, have been hindered in their efforts to put this ideal into practice by the separation between elementary and secondary education that was found in the European cultures of the nineteenth century, and some of the most important educational events of the past 50 years are to be found in the efforts of the older school systems to solve three problems: first, how to make possible a just transfer from the one type of school to the other; secondly, how to effect a smooth transition from the one kind of education to the other; and thirdly, how to develop an integral view of education. The first of the three problems is concerned mainly with methods of selection and allocation, the others with curriculum, teaching methods, and school organization. This chapter, therefore, forms a connexion between the preceding chapter and the following one, and will overlap the topics dealt with specifically in each of the others.

The transitional stage in most countries is the period between 11 and 12 years of age and 14 and 15. It is during this period that the curricula and the teaching methods begin to change from what is regarded as essentially primary to what is characteristic of secondary education. The length of the basic primary school courses varies considerably throughout the world. In most countries children begin their primary schooling at 6 years of age, though in some they begin at 5 and in others at 7. For nearly all, however, the point of change is between 10 and 12, and the transitional period usually lasts until 14 or 15. In the more advanced countries the greater part of this period comes within the years of compulsory schooling, and it is likely to become compulsory in all countries during the next quarter century. It is the key period in the reorganization of many of the well-developed systems, especially in those that have different types of school at the junior secondary level; and as compulsory education is extended upwards in the less advanced countries, the problems of the transitional period will be faced by them too.

SELECTION FOR SECONDARY EDUCATION

In all countries that have tried to give the able child a chance to continue his education beyond the primary level

1. Great Britain, Board of Education, Report for 1908–9, pp. 31–2.

the problem of selection arises at an early stage: how to devise a valid means of assessing the scholastic abilities of the applicants for admission to the secondary schools. Where the secondary school was a direct continuation of the primary school and tuition was free, as it was in the United States as early as the beginning of this century, the matter was relatively simple—pupils were promoted if they had done satisfactory work in the upper grade of the primary school. Where a two-track system existed at the primary level, the matter was much more complex. The grammar school, the *lycée* or the *Gymnasium*, had always in effect been 'secondary' schools requiring some measure of preparatory education in their entrants and administering their own entrance examinations to satisfy themselves that applicants were able to meet their admission requirements. Often these were based upon a preparatory-school course that included Latin and other studies that the primary school pupil had not had an opportunity to learn. The majority of the entrants in the European schools paid fees, came from the middle classes of society, and received their primary education in fee-paying preparatory schools. When scholarships began to be provided to enable working-class children to obtain free secondary schooling, the entrance requirements of the secondary schools made it necessary for the candidates to obtain special coaching, and this was a difficult hurdle for the children of poor parents. In consequence of the democratic trend of modern times, the pre-secondary curricula of the special preparatory schools or departments were often made the same as those of the ordinary primary schools so that a common basis of knowledge could be presumed for all candidates, but in most countries the process of equalizing the conditions for candidates for entrance stopped at this point for many years. Indeed, the actual admission examinations varied considerably. They might be conducted by the principal or staff of the school that was admitting the pupils, they might be conducted by a committee comprising an inspector as well as teachers, and they might be oral or written or both. Dissatisfaction with the possibilities of unfairness inherent in this lack of uniformity was common, and many countries tried to devise more efficient methods of selection. While only the children of the well-to-do sought to enter the secondary schools the problem was not serious, for there were enough schools to take all the candidates who met the minimum requirements in scholastic attainment. The real difficulties have been caused in recent years by the increasing number of pupils who have sought to continue their education and have put pressure upon the entrance procedures of the selective schools. Many countries still retain methods of selection that have been little influenced by the findings of research; some, however, have constantly attempted to use the best methods known. At the present time many different approaches to the problem are being made and it will be useful to consider some of these.

The countries of the world may be grouped roughly into three categories according as (a) they restrict entrance to selective secondary schools by the use of tests and examinations that are essentially competitive in character; (b) they admit children on the basis of an examination designed simply to see whether they have mastered the primary school course; (c) they admit all who, in the opinion of their teachers, have satisfactorily completed the primary school course. In the first category are systems like those found in most Western European countries, many of their former colonies overseas, and many Latin-American countries. All of these provide a variety of secondary schools, some of which are more selective than others. In the second category are systems like those of most of the Eastern European countries, certain countries of the Middle East such as Iraq, Syria, Turkey, and a few elsewhere where, at the junior secondary stage, there is a unified school but one that admits only those children who have completed the scholastic requirements of the primary school. In the third category are systems like those of the United States and countries that have been influenced at various times by its practices, for example, China, Japan and Korea, certain of the British Dominions like Canada and New Zealand, and other countries like India and Sweden. In these countries the first stage of secondary education is unified and is open to all normal children who have spent a certain number of years in the primary school.

It is the countries in the first group that have had to face the most difficult problems in selection and they will be considered first. Their experience has influenced methods of making provision for secondary education throughout the world.

Systems with selection and allocation

In Great Britain, more than in most countries, persistent and varied efforts have been made throughout the present century to improve the methods used to select pupils for places in the secondary schools, and much research has been carried out, especially since 1944. Practices developed in Britain have spread to many other countries, especially the newly independent States in Africa and Asia that were formerly under British administration, and a brief outline of the main trends will be given here. These have immediate relevance to the problems of scholarship awards now being faced in countries still at the stage of having to select carefully a minority of their primary school pupils for continued education.

At first there was little uniformity in the methods used in Great Britain to decide which children in the primary schools of a district merited scholarships to attend the available grammar schools.[1] Many local authorities, therefore, devised district-wide examinations. The London County Council, for example, instituted in 1894 its Junior County Scholarship examination, which consisted of written tests in English and arithmetic, followed by supplementary tests in French, algebra, and natural science. In this way a means of assessment of scholastic attainments was developed that enabled the selection committee to base its decisions upon data that were comparable for all the children throughout the district. To the disappointment of many educators and members of the local education authorities, however, only a small proportion of the scholarships went to children of the poorer sections of the community. Research carried out by officers of the London

1. Flan Campbell, *Eleven-plus and all that; the Grammar School in a Changing Society*, London, Watts, 1956, p.96.

County Council showed that between 1893 and 1904 it was usually children from lower middle-class families —for example, children whose fathers were clerks, shopkeepers, or highly skilled artisans—who most often gained the scholarships. It was noted that few children from certain of the poorer working-class areas or from families of semi-skilled or unskilled workers ever received scholarships, while a high proportion of children from well-to-do suburbs did. The London County Council devoted much attention to the question of how to remedy this situation, and care was taken to ensure that it was not the result of schools in the poorer districts having less efficient teaching staffs; but these efforts brought about no significant change in the situation. The council then considered such proposals as allotting a definite quota of scholarships to pupils of the poorer schools even though these pupils might not obtain the highest marks in the examinations. Such proposals were based on the assumption that the best pupils in the poorer areas, although lower in actual school attainments than the best pupils from the more well-to-do social groups, had equal educational potentialities, which had been inhibited by their unfavourable environment. These proposals were not adopted, however, because they involved what seemed to be the injustice of excluding children of high attainments in favour of children known to be actually lower in attainment and only presumed to be higher in capacity.

In 1913 the appointment of an educational psychologist for the London area led to renewed efforts to solve the problem, and it was decided to experiment with the use of standardized intelligence tests to assess the 'innate intellectual capacity' of children irrespective of their actual scholastic attainment, which might have been unduly influenced by differences in their social and economic background. Some measure of success was achieved by the newer methods. Intelligence tests, though they too have since been shown to be affected by the cultural environment of the children, did reveal intellectual abilities that a poor home environment had not permitted to develop. With the use of such tests the London County Council found that the number and proportion of children of manual workers entering the grammar schools increased steadily.

At the same time research was being carried out into the weaknesses of existing methods of examination. The unreliability of interviews as a means of assessing candidates was made clear, and the great variation in the judgements of examiners in assessing even the same written work were convincingly demonstrated. Such results led to the development of a new type of examination tool, the standardized test of scholastic attainment. In the standardized test all children were asked the same questions, the questions were graded in an empirically determined order of difficulty, and the usual method of answering the questions was for the pupil to choose one of several alternatives already set out for him in the test paper. The answers were either right or wrong, so that marking of such papers could not be affected by fluctuations in the judgement of the examiners. This was in several respects an advance upon the earlier, less objective methods of examining, and during the 1930s and 1940s the majority of local authorities appear to have used some combination of standardized intelligence and scholastic attainment tests as part of their selection procedures.[1]

On the passing of the Education Act of 1944 the machinery of selection again came under very careful scrutiny by all the local authorities. Stimulated, too, by the experiences of personnel selection in the armed forces during the war, a number of research groups devoted themselves to problems of allocating children to different types of secondary school. For example, both the National Foundation for Educational Research in England and Wales, which was established at this time, and the Scottish Council for Research in Education, which had been in an existence for over a decade, carried out major investigations, and their reports have had far-reaching effects upon the work of the local authorities. Similar research has also been done in the university institutes of education. With the post-war influx of students from all parts of the world, British experience has markedly influenced the practices of countries like India and Pakistan, and former British territories in Africa and Asia.

In spite of the efforts made to improve grammar school selection in Great Britain, there is considerable dissatisfaction with the process. Researches have shown that even with the best procedures so far devised, a considerable proportion of the pupils selected for grammar schools may be expected to be less able than many who are rejected.[2] They have shown, too, that socio-economic influences on the intellectual development of young children make it very difficult in practice to devise tests that will distinguish potential educability from actual achievement. Even the ability to do intelligence tests is influenced by the environment of the child and is susceptible to coaching, while a poor environment will counteract to a considerable extent the influence of schooling. The British experience shows clearly that the problem of making effective provision for the education of children from culturally impoverished homes cannot be solved by the school alone, and that the full benefit of schooling cannot be expected to be reaped by the first generation of children to be offered extended educational opportunities.

It is difficult to gauge the success of the efforts already made to ensure that talents will be developed no matter in what section of society they occur. In the report of the Central Advisory Council on Education (England)[3] on the education of boys and girls between 15 and 18, it is stated that among the families of manual workers it was the exception for a child to stay at school after he was legally free to leave. The report quoted figures relating to National Service recruits to the Army and the Air Force, showing that while 51 per cent of the children of the professional or managerial class stayed at school until they were at least 17 years old, only 6 per cent of the children of semi-skilled and unskilled workers did so. The report showed, too, that many children of high intellectual ability were not receiving a full education, since 42 per cent of the National Service recruits who were in the top 10 per cent

in general intellectual ability had left school before they had reached the age of 17.

The problem of selection is radically transformed when, as happened in Great Britain in 1944, all forms of schooling for young adolescents come to be regarded as secondary education; for then the contributions of all these forms of schooling to the development of the young people of the nation are seen to be in some ways equal in importance, in the sense that each is intended to provide the maximum chance of development for a certain group of young people throughout their adolescent years. The different types of school have tended to lengthen their courses upwards and to seek parity in respect of leaving certificates. They have aspired to achieve a general equality of status, based upon their diversity, each having a distinctive task and each giving the appropriate kind of education to the pupils in its care. They have aimed, in consequence, at having pupils correctly allocated to them in terms of their distinctive abilities and aptitudes. The problem of selection for a single type of school has thus been transformed into one of allocating pupils to several different types. In England it was envisaged that there would be three main types of secondary school: the academic, or grammar school type, which would lead directly to the universities; the technical schools, which would lead to higher technological institutes; and the secondary modern schools. In Scotland there was a division into schools of two lengths, the five-year senior secondary schools and the three-year junior secondary schools.

The problem of allocation, however, has proved to be one of even greater difficulty than that of selection. In spite of persistent research in Great Britain in the years immediately prior to and after the 1944 reorganization, no examinations or batteries of tests have been devised that could classify the pupils at the age of 11 into the three distinct psychological types envisaged as the basis of the secondary school system. On the whole, the correlation between the abilities of children at that age proved to be high, indicating that the ones who showed high technical ability would be the same ones who showed high academic ability. The proportion of children whose level of ability was markedly different in these two fields was too small for their identification to help much with the general problem of allocation. On the other hand, the selection of children for the academic grammar school seemed fairly successful, and the tendency has been to rely mainly upon a simple division into grammar school and non-grammar school children. The secondary technical schools have not had the enrolment expected of them, and they have not increased in numbers in proportion to the growth of secondary education. Some local authorities have ceased to provide them; some have joined them to the grammar school, others to the modern school, so that a bi-partite rather than a tri-partite system has come into being in several areas.

The trend in Britain, arising out of a combination of scientific research and much experimentation on the part of local authorities, indicates that in the ordinary course of primary schooling the only abilities that can be measured with a reasonable degree of accuracy are those based upon the normal work of the school. These are mainly the powers of verbal and abstract reasoning. To arrive at measurements as valid in other fields, such as practical or technical achievement, children would have to be given equal opportunities for developing such abilities; in an ordinary primary school they do not have such opportunities and many of their potentialities cannot be accurately assessed. The basis of a diversified allocation, it is coming to be realized, is a broad education common to all children to enable a wide range of potentialities to develop. This conclusion is leading to the view that the period of common studies should be lengthened, and that the final separation into different types of school should be postponed at least until the senior stage of secondary education.

In consequence, Great Britain, France[1] and other countries are attempting to provide a broad common curriculum in the first year or two in all types of secondary school and to have the pupils carefully observed to see what abilities emerge that may make a change of school or course desirable. In practice, there are many difficulties to be overcome. The first is that the different types of school at the secondary level are distinctively different in their approach to education. The *lycée* and the grammar school, for example, have for generations worked to a six- or seven-year curriculum, starting mathematics and foreign languages early. As in the classical *Gymnasium* in the Federal Republic of Germany with its nine-year course or in the *ginnasio* and *liceo* and the *istituto magistrale* of Italy during the 1930s, few teachers believe that they should delay the beginning of their particular kind of education because a few children may have been wrongly allocated and may need to change schools. Nor, in general, have the grammar schools the facilities to provide a variety of practical subjects in order to see whether any of their pupils might be better served in schools with a technical bias. The modern school, on the other hand, will seldom have the academically and technically qualified staff necessary to provide grammar school or technical courses in order to discover and give preparatory teaching to children who should be transferred to these other schools. Nowhere does transfer from one type of school to another occur as frequently as would seem necessary to correct the proportion of known errors of selection, nor do the teachers in the modern schools wish such transfer to take place; for the sake of developing the prestige of their own schools they prefer to keep pupils of high ability and do the best they can for them. This leads to a convergence of the different types of school to a common pattern, as may be seen by studying the way in which the secondary and technical schools of New Zealand have each tended to evolve into a similar kind of multi-lateral or comprehensive school.

In Great Britain and France and in several other countries, dissatisfaction with methods of allocation based upon a single examination or set of tests has led to attempts to make use of the knowledge of the children acquired over the course of years by their primary school teachers. There are two main factors that make it difficult to reap the benefits of this knowledge. First, it is not easy to devise a valid and reliable method of making the assessments of one teacher comparable with those of another. Cumulative school records are recognized to be of value in giving

1. Roger Gal, *L'Orientation Scolaire*, 2nd ed. Paris, Presses Universitaires de France, 1955. 140 p.

educational guidance to children and their parents, and they are used in this way in several countries, e.g. Ceylon, Chile, the Federal Republic of Germany, and Japan, but they cannot easily be reduced to a simple index for the purposes of selection or allocation. The second factor, however, is even more difficult: it is the one already referred to, the need for a richer educational programme than the primary schools normally give, which would allow young people to try a variety of activities and thus reveal their aptitudes.

The countries that appear to be able to provide such variety at the first stage of secondary education are those, like Canada, Japan, the United States, and a few others, that have a unified and comprehensive junior high school whose special function is the exploration of aptitudes prior to the specialization of the senior stage. Moving in that direction, several local education authorities in Britain are considering ways of reducing the diversification of schools during the junior secondary stage. A few have decided to adopt the comprehensive school idea, as was done earlier by London and Middlesex. Some are providing only two types, a grammar-technical and a modern school. Some are considering multi-lateral or bi-lateral schools. In Leicestershire[1] a more radical solution is being sought by dividing the secondary period into two three-year cycles, with a common junior high school leading to differentiation at the senior stage; this is discussed at greater length in the section on the junior secondary period in selective systems (see below).

The British experience has been set out at some length because it has shown what can and what cannot be achieved in the allocation of children at the age of 11 and because the various methods tried over many years can all be found in use at present somewhere in the world. With a great deal of research and with persistent trying out of different methods, it has not been found possible to do what was envisaged by those who framed the 1944 Education Act, namely, to abolish selection by means of competitive examinations and to replace it by allocation based upon the assessment of aptitudes. As early as 1946 a committee set up by the National Union of Teachers reported that it was reluctantly compelled to conclude that the only criterion that could be relied upon was whether a child was suited or not for a grammar school education;[2] and in fact 10 years later the majority of local authorities were still using standardized tests of English language and arithmetic, together with a test of verbal reasoning, upon which to base their allocation; the grammar school places are filled, and the rest of the children go to a secondary modern school, except for a few who, with high general ability, elect the technical school.

Thus Great Britain still largely retains methods of selection based on the scholastic work done in the primary school. Where it has made the greatest advance, however, is in developing reliable and valid methods of testing and examining scholastic aptitude and ability. Few European countries that select by means of examination, or countries in other parts of the world that have been influenced more by various European methods other than British ones, have yet adopted such reliable methods of standardizing or normalizing the marks or assessments used for selection purposes. In France, for example, up till 1957 admission to all *lycées* and *collèges* was based upon the results of examinations which included dictation, the comprehension of a passage read, and arithmetic. It was felt that by current standards of objectivity in test construction and of reliability in marking, such an examination could not be regarded as efficient and could not maintain equal standards of difficulty even in the hands of a single examining commission. Pedagogical research carried out in France has shown that even in such an apparently objective matter as the marking of a problem in arithmetic done by pupils in their final year at the primary school, there may be a considerable variation in the marks given by examiners; using the traditional marking system of 0–20, examiners in some experiments have varied by as much as 14 marks in assessing the worth of the same answer.[1] To obtain a reliable assessment the test needs to be composed of many sums, scientifically graded in order of difficulty, and its marking system needs to be objective.

When, as in parts of Europe, a great deal of responsibility for filling the available places in the selective schools rests with the teachers themselves, the variability of standards throughout a given area is likely to be even greater. In an endeavour to lessen the errors of such methods of selection, a recent trend has been to consult parents to see what information on the child's development and aptitudes they have that is not revealed in the normal course of schooling and to see what educational and vocational ambitions are held by the pupil's family. Such methods could be a more useful adjunct to school results if the schools to which the pupils are to be allotted were believed to be equal in both the social and the educational sense; but when some types of school have greater prestige than others, parents, not unnaturally, want more children to attend them than can be accommodated and the final decision is thrust back upon the teachers. A method being tried in parts of the Federal Republic of Germany and elsewhere is to regard the first year or two in the secondary school as a period of probation. This is helpful in one way: if a child cannot do satisfactory work in the *Gymnasium* he can be placed in a school of a less academic type. The reverse process is seldom practicable, as there is still some differentiation between the curricula of the different types of school from the beginning and, as British research has shown, pupils in the average modern school do not receive the same stimulus to intellectual growth as those in the more academic school, and consequently not many are likely to be regarded as capable of rising above their first allocation. A practicable system of exchange during the first year or two appears to depend upon a common course of study, and this, as has been realized by reformers in France since the establishment of orientation classes by Jean Zay in 1937, and as has been shown by the experience of Italy, is difficult if the junior classes are attached to distinctively different types of school which impress their distinctiveness upon them.

The Swedish school reform, which has already been described, took account of similar findings on the hazards of early selection, and Sweden has taken the radical step of completely unifying the period of primary and junior secondary schooling. As early as 1937 studies of the value of the secondary school entrance examinations had shown that the relation between success in these examinations and success in secondary school was not high, and that a considerable number of the rejected candidates would have done better than a number of the accepted ones.[1] It was found, too, that the primary school teachers, who were able to rank their pupils in order of achievement with considerable reliability, reported that the high school entrance examination in Swedish and arithmetic was excluding many pupils whom they considered fit for secondary schooling and at the same time was admitting pupils they knew to be lower in scholastic ability. Even when careful marking instructions were introduced by the Board of Education and methods of normalizing the scores were used, the results were not satisfactory. In 1949 the external examinations were given up, and marks awarded by the primary school teachers themselves were used. An attempt was made to achieve comparability of assessment from teacher to teacher by basing the marks upon a normalized seven-point scale. It was found that the teachers' marking was just as accurate as that of the external examination, but in fact neither was satisfactory, and the question of whether differentiation at that age was wise or practicable came to the fore again.

In 1946 a School Commission had been set up to study possibilities of reforming the secondary school system in Sweden. In the light of English aspirations at the time, the commission was concerned to see whether children could be divided into theoretical and practical types at the end of the primary school period and whether differential provision could be made for them along such lines. The commission was responsible for initiating major researches into the nature of and the relation between theoretical and practical ability. Fundamental research then carried out showed, as had been found in Great Britain, that the majority of pupils were very similar in respect of their scores in theoretical and practical aptitude tests, and that only in a minority of cases did any considerable differentiation in these aptitudes occur. The general finding was the usual one, that differential aptitudes could not be surely discerned at this age, and that selection would inevitably become based on general scholastic ability. An important corollary of this finding which impressed the commission was that if pupils of high scholastic ability were allocated to the academic secondary schools, the majority of the most able practical pupils would in fact be included as well, and the technical schools or technical streams would be deprived of their most promising pupils. The commission considered that the social and educational consequences of such selection were harmful, and decided that the period of unified schooling should be lengthened to nine years, so that there would be a chance for careful observation and orientation in these years of early adolescence when abilities are beginning to show themselves more clearly.[1]

Systems basing entrance upon promotion practices

In several countries, notably those of Eastern Europe, where there is a unified single-track system until the end of the junior secondary period, that is until the age of 14 or 15, entrance to the junior secondary school is not automatic but is granted only to those pupils who have demonstrated a satisfactory knowledge of the minimum curriculum requirements of the primary school. Those who fail must spend another year in the primary school, and those who continue to show very poor achievement may be placed in special remedial classes or schools.

The conditions under which the promotion examinations must be given, the method of drawing up the examination questions, and the marking scales to be used, are usually prescribed in detail by the central education authority, although the actual conduct of the examination is left in the hands of the teachers themselves.

At the end of the junior secondary period, the examinations which give entrance to the senior secondary schools are usually carried out by a committee consisting of the teachers of the school, representatives of the education authorities and officers of the municipalities, or teachers from the senior secondary school to which the successful pupils will go.

The details of the examinations differ from country to country. As a concrete example, however, a method used in Rumania in recent years may be noted. Pupils in the fourth class of the primary school who had reached a satisfactory standard in all their subjects could sit for an examination which allowed them to enter the fifth class. The subjects examined were Rumanian or the language of one of the national minorities, and mathematics. The language test usually involved the dictation of a passage of 80 or 90 words taken from a reading book used by the class, and the test of mathematics comprised a problem and exercises based upon the curriculum for the year. The problems for the written test were chosen by the examining teacher and were written on examination cards, one question on each card, and the candidates drew by lot the questions they would have to answer. Examination methods of this kind involve a considerable element of chance, for it is difficult if not impossible to ensure that all the test cards are of equal difficulty. However, the final mark given is usually influenced by a consideration of a pupil's work throughout the year as well as by the result of the special examination.

The trend in these countries is towards abolishing promotion examinations, except at the end of the junior secondary period for admission to the senior stage, and promotion is being determined to an increasing extent by the teachers' judgement of the quality of the work done throughout the school year. Promotion still implies the maintenance of a minimum standard of achievement before

the pupils pass on from one class to the next, and in consequence a proportion of pupils repeat classes and the age range in each class is considerable. The evidence of research in several countries, however, indicates that backward children ultimately reach higher levels of attainment if they are kept in classes with their fellow pupils of approximately the same age, and when shortages in buildings and teachers are overcome it is likely that there will be an increasing tendency to promote pupils from class to class in the junior secondary school without examinations and without insisting upon a fixed standard of attainment.

Conclusion

Those countries which have decided to regard the years between 11 or 12 and 14 or 15 as the first stage of secondary education but which have inherited a system in which children have traditionally been separated into different types of school at an early age, have all found difficulties in their attempts to allocate their pupils fairly to the different schools available. Many of their educators over the past 10 years have come to the conclusion that allocation should be based upon a period of orientation during which the pupils would not be irrevocably separated into different types of schooling even if they were in different types of school. In practice it has proved difficult to provide the varied curriculum required for the purposes of orientation, and it is widely believed that a common school is needed at the junior secondary stage. Sweden is independently developing an *enhetsskola* not unlike the schools of Czechoslovakia, Eastern Germany, the Soviet Union, and the Eastern European countries. In other places, notably Japan, a junior high school system similar to that of the United States of America has been or is being established. These approaches to the problem differ in several respects, but they have this in common: they make no attempt to allocate pupils to different kinds of secondary school at the age of 11 or 12, but rather, in the environment of a common junior secondary school, they attempt to provide a course of general education and to determine at the same time, by observation of the pupils' work, what will be the best kind of specialized training for each at the senior stage. Orientation and allocation problems are being dealt with in the context of the common school, and their experience throws a valuable light upon the possibilities of the common orientation period as compared with other methods of making the final differentiation of pupils into specialized courses or schools. The American junior high school and others like it were set up to meet the need for a smoother transition from primary to secondary school, so this problem will be considered next.

THE ARTICULATION OF PRIMARY AND SECONDARY EDUCATION

We have seen that in most European countries, and in countries influenced by Europe in the development of their systems of education, means of access from the primary to the secondary schools have been steadily established over the past 50 years. The question of access, however, is by no means the only problem that has arisen: problems of transition and articulation have also been causing concern and are far from being satisfactorily solved. The essence of such problems lies in the fact that in their origins and in their nineteenth century growth the primary school and the secondary school were conceived of as giving qualitatively different kinds of education, with different aims, different curricula, different teaching methods, and a different spirit. The division between them did not automatically close when the children from one type of school entered the classrooms of the other.

In the nineteenth century primary education was regarded almost everywhere as a means of training children of the lower classes to be obedient, honest, hardworking, literate workers. The elements of literacy, the main tenets of religion, the current precepts of morality, constituted its curriculum in the early stages. Gradually, with the progress of science, industry and commerce, and democratic government, the curriculum broadened, but the tendency of the times was to emphasize the acquisition of useful knowledge by the potential worker and citizen rather than to develop his ability to reason and pass judgement upon the problems of human life. Under the influence of the newly developing science of pedagogy, the art of instruction reached a high level. Basic facts were organized and presented methodically by teachers trained in the art of presentation, they were memorized by the pupils by the methods of drill, and they were tested and examined by inspectors. The teachers themselves were not well educated persons by the standards of their own times; usually they had had no more than a primary education, followed by an apprenticeship as pupil-teacher and some instruction in teaching methods at a normal school or teacher training college. An undue emphasis on the memorization of facts and upon formal rather than functional methods of instruction was inevitable in the circumstances of the times, and indeed it still appears to be so in the beginnings of any new educational system which starts from the basis of an illiterate population and a body of teachers who themselves have only the barest elements of modern knowledge. This is the situation in large areas of the world today, and the problems that are described here, in so far as they concern the articulation of primary and secondary education, may yet arise in several underdeveloped countries.

Some of the important pedagogical assumptions on which the nineteenth century approach was based were, first, that ideas implanted in the mind are the means of influencing the attitudes and behaviour of the human being; secondly, that it is possible to compile definitively a body of factual knowledge that every citizen should master; and thirdly, that this body of knowledge can be divided up into sections arranged in order of logical or psychological sequence so that they may be progressively mastered as the pupil passes through the school system. The effect of such assumptions and the educational practices based upon them was to develop in both teacher and pupil a tendency to revere basic facts and information, however little related they might be to their needs, and to fail to appreciate, and even perhaps to distrust, the play of ideas. The French termed this *l'esprit primaire*, the elementary school mind, as distinct from the mind that was trained by secondary and university education.

The concept of the trained mind was itself one that was influenced by the social separation between upper and lower classes in nineteenth century Europe. The upper classes were the effective rulers of their States; they alone had the means and the leisure to cultivate scholarship, philosophy, the sciences, and the arts. Educators of the time considered that they needed to have a sense of mission, whether national or international, as the spring of their political action; that they needed to be able to think about and solve problems of politics and human relations, as well as of economics, science, and technology; that they needed an appreciation of the growth of human culture, and of the role of a leisured class in cultivating the graces of life—in sum, that they needed to be aware of the sources and direction of civilization, at least of modern European civilization, and mentally alert enough to guide its future development. Their school curriculum had to be the whole sweep of civilization, and much of the curriculum of the post-renaissance grammar school was relevant to this. Young people started with learning the languages of Greece and Rome and later those modern languages that had a developed literature, and while at secondary school they began the study of ancient and modern culture which, typically, was the chief preoccupation of the early nineteenth century universities; they studied mathematics, not as a working tool but as a trainer of the reasoning and logical faculties, and at a later date the physical sciences. The secondary school and the university were regarded as a continuous process of education of the youth of the upper classes. The secondary school in fact was a grammar school, giving the key, first in languages then in sciences, to the ancient and modern civilizations.

Between this outlook and that of the primary school there was a deep and wide abyss. It was expressed in curriculum, in methods of teaching, and in attitudes. In curriculum the typical primary school subjects were reading in the mother-tongue, spelling, handwriting, routine commercial arithmetic, a miscellany of general knowledge, geographical, historical, and natural science facts, training of the co-ordination of hand and eye by means of representational drawing and manual work, singing, and religious teaching. The secondary school subjects were Greek, Latin, modern foreign languages, ancient and modern history, Euclid, algebra, higher arithmetic, natural and physical sciences. By the nineteenth century there were national differences to be seen in the views of the educators of the different countries of Europe, and these had their characteristic influence upon the curricula. The French, conscious of their country's central role in European culture, tended to emphasize the play of intelligence and ideas; the Germans emphasized thoroughness of philosophical and scientific scholarship; the British were very conscious of their role as a colonizing nation. These differences between the secondary schools were considerable, but they were less than the basic difference between elementary and secondary education.

Differences in methods of teaching cannot be quite so clearly demarcated. Much of the work of the secondary schools had to be conducted at the level of rote-memorizing, on account of the central position occupied by the learning of foreign languages and, later, of a large body of scientific knowledge. Yet, at least for those young people who continued their secondary education to the end, this basic learning opened up historical perspectives, realms of ideas and speculation, areas of feeling and sensibility, that involved very different methods of interplay between the mind of the teacher and the mind of the student than that which occurs when elementary factual knowledge is being taught and learned. At its best, particularly in the later years of school life, the teaching in the secondary schools was influenced by that spirit of restless inquiry, discussion of ideas, and thorough specialist scholarship that characterize good university teaching. The difference in results obtained by the two different schools was due in part to the fact that the elementary child terminated his education during those formative adolescent years when the secondary school pupil was still in the early stages of his education, thus the mind of the secondary school pupil was cultivated longer. That, however, was only part of the difference; the method of cultivation itself had some significantly different elements in it, not the least being the attitude of scholarly enthusiasm for their subjects that the best secondary school teachers had gained from their association with the universities.

The more distinctive the primary and the secondary schools, the more difficult was articulation between them when children began to pass from one to the other. The problem in general terms was how to change the curriculum, methods, discipline, and spirit of the teaching during those years when primary schooling was being completed and secondary school begun, in such a way that the first stage could lead naturally into the second. The problem had different facets according to whether it occurred in a system where there was a high degree of early differentiation between special types of school at the secondary level, as was the case in most of the larger European States, or whether it occurred in one relatively undifferentiated, as in the United States of America and some of the British dominions. It was in these latter systems that the problem first assumed serious proportions.

At an early date these countries had developed complete systems of primary schools, usually eight years in length and starting from the age of 5 or 6 years, and by the end of the nineteenth century the great majority of their children were completing the full primary school course and increasing numbers were going on to the high school. The high schools of the United States were still in many ways influenced by the European secondary school, especially in their preparatory function for the universities. Universities try to maintain international standards of scholarship and frame their admission requirements with this in view; and the European universities based their work upon what was taught in secondary school courses which were as long as nine years in Germany and seven years in France and England. Inevitably, then, an abrupt and rapid start had to be made with the traditional secondary subjects—foreign languages, mathematics and the physical sciences, in order that they could be brought up to university entrance level in four years. In New Zealand the position was essentially the same, although it had been arrived at by a slightly different road. New Zealand's first urban secondary schools had been founded on the model of the English 'public' schools. They took boys at

the age of 13 or 14, after they had already studied the rudiments of Latin and other secondary subjects in a preparatory school or department, and prepared them in three or four years for the university entrance examination. Thus their standards became firmly established. Later, the 'free place' system was instituted, which soon filled the secondary schools with pupils from the primary schools who had not had the advantage of special preparatory training, and for whom the change from primary to secondary was very abrupt. Eventually the preparatory departments of most schools were abolished, and the sudden change-over from primary to secondary school was experienced by all pupils alike.

An early attempt to bridge the gap between the two systems took place in the United States of America. There the situation at the beginning of the twentieth century was very different from that in most European countries. Structurally, the common school system had developed in accordance with the ideals of the founders of the Republic. There was no separation of children at the end of the fifth or sixth year of the primary school into different types of school with different purposes and different curricula. Instead, almost all children were attending the eight-year primary school from the age of 6 to 14, at which time most of them left school and the remainder entered the four-year high school. Functionally, however, the school system was divided into two distinct units—an eight-year primary school, similar to the school provided in Europe for the child who would not be continuing with secondary education, followed by four years of secondary schooling which commenced two to four years later than in Europe. The high school although open to all children who passed through the primary school, still very largely emphasized its role of preparing pupils for the university and higher education. The Committee of Ten, set up in 1892 by the National Education Association to consider how to obtain some uniformity among the variety of different approaches to secondary education, produced a report which influenced the secondary schools for another three decades, yet the curricula it recommended were highly academic. For example, it advised the following common core of subjects which all pupils should take: English, a foreign language, algebra, geometry, trigonometry, physics, chemistry, and ancient history. Moreover, it stated that every subject which was taught in a secondary school should be taught in the same way and to the same extent to every pupil for so long as he pursued it, no matter what his vocation was likely to be nor how long or how short his stay at school.

With so much importance being placed upon preparation for university entrance, it was inevitable that there should be a wide gap between the primary school and the high school. Several new subjects were started simultaneously and had to be brought to university entrance standard in only four years; in the large schools specialist teachers took each subject instead of there being one teacher for the whole class, as in the primary school; and the course to be followed had to be decided at the beginning of the child's high school life, with little or no opportunity for adequate experience upon which to base his choice.

During the latter half of the nineteenth century, in various parts of the United States, sporadic attempts had been made to organize separate schools for children in the last two classes of the primary school, so that they could obtain a broader education than that provided in the primary school and thus be better fitted for work or further education. The trend towards reorganization, however, did not become strongly marked until the twentieth century. It was precipitated by the report of another committee of the National Education Association, the Committee on the Six-Year Course of Study. This report, published in 1907, recommended that the 12 years of public schooling should be divided equally between primary and secondary education. The major advantages seen by the committee in beginning secondary education two years earlier were: first—foreign languages, sciences, and manual training could start at an earlier age by using the specialist teachers, laboratories, and equipment of the high schools; secondly, it would be possible to initiate pupils into the secondary school subjects more gradually, beginning foreign languages by the direct method, and starting mathematics and the sciences with much practical work as an introduction to theoretical bookwork. In this way, the abruptness of the transition from primary to secondary school could be mitigated. This extension of the secondary school down into the primary period was thought of not as a means of saving time but as a way of ensuring a better adaptation of the children to their new studies. At the same time children who would otherwise leave school prematurely might be encouraged by the ease of the transition to continue with their high school studies beyond the eighth grade.

Many school systems, then, began to be reorganized upon the basis of a six-year high school course. Some reorganized high schools were complete 6-year schools, others were three-year junior high schools followed by three-year senior high schools. Had the purpose of junior secondary education been merely to bridge the gap between primary and secondary schooling, there would have been little incentive to the formation of the separate junior high school; but in fact other functions developed which played a decisive part in its evolution. In the first place, the reorganization did tend to encourage pupils to stay at school for the extra year, to obtain three years of junior secondary education before going to work or before seeking some specialized trade training. These young people, in the main, were not academically minded and the university preparatory curriculum seemed little suited to their needs. The schools, therefore, gave attention to providing a more useful schooling for those pupils who were not likely to continue beyond the age of 15, and this meant an expansion of practical pre-vocational courses. In the second place, as some of these pupils continued their studies even further into the senior secondary period and the senior courses became more diversified, it became necessary to make provision for educational and vocational guidance at the junior stage.

In the next two decades the senior high schools regained the breadth that had characterized the earlier academies, and increasingly, too, they began to attract more and more young people. As this prolongation of schooling for all pupils occurred, it became all the more necessary to develop the guidance function of the junior high school rather than its terminal education function. Even where no separate junior high school was established, the junior

section of the complete high school came to have its distinctive organization in order to be free to carry out its distinctive functions.

The change from the 8-4 organization continued at a steady pace until the second world war and then, with the steep rise in secondary enrolments, proceeded much more quickly, so that now there are more pupils in the new school system than in the old. Although the change from primary to secondary education is now made at grade 7 almost everywhere in the United States, there is still a good deal of variety in the way in which the secondary period is organized. The six-year complete high school, divided into junior and senior divisions of three years each, appears to be most common, followed by the separate three-year junior and senior schools. In addition there exist 6-2-4, 6-2-5, 6-4-2 and 6-4-4 organizations, some of which appear to have grown up as the result of the difficulty in finding accommodation for the increasing school population and as a way of making maximum use of whatever buildings existed. The 6-3-3 type or the 6-6 type, however, appear to receive most support upon general pedagogical grounds.

It is generally considered that the emergence of the junior secondary period as a period of common schooling with its own distinctive quality has achieved the main purposes for which the reorganization was undertaken. It has provided a core of general education directed towards the development of the young adolescent as a person, and a variety of optional courses whose main purpose is exploratory, enabling the pupils to try out various possible avenues of future study or work and to choose wisely their more specialized senior high school courses. In these ways the gap between the primary and the secondary curriculum is being bridged, and at the same time the traditional secondary studies are being started earlier and by children who have had a chance to choose them on the basis of some real experience of their nature. The transition from primary teaching methods to those which are appropriate to the secondary level can also be made smoother for the pupil who passes through a junior secondary school or department; this will be referred to again in the relevant section of the chapter.

The changed educational situation in the United States at the present day has made obsolete one of the original purposes of the junior high school; in few cases is it now called upon to provide a terminal education for more than a small proportion of its pupils. With the steady lengthening of schooling it is becoming simply an intermediate stage between the primary school and the senior high school, and this appears to be the reason why the six-year high school has been increasing in recent years more rapidly than the separate junior high school.

The advantages of the six-year high school are of two kinds: First, it is easier to put into practice a continuous curriculum throughout the whole course of six-year secondary education if the junior and senior divisions form part of one school; secondly, in the smaller towns and in rural areas, the six-year school because of its larger size, will be able to provide school buildings, equipment, and a specialized teaching staff more economically. The greatest danger in the six-year school as seen by the junior secondary teachers themselves is that the pressure of the senior division will weaken their conception that the junior secondary pupil has distinctive needs because he is in a phase of transition in psychological and educational development. Specialist teachers in the senior high school want their subjects and methods to be started as early as possible.

With the gradual disappearance of the need to provide a terminal education for pupils leaving school at the age of 15 or 16, the curriculum of the junior high school is becoming more concerned with continuing a general cultural education than with giving an early introduction to vocational skills, and the process of orientation is being interpreted in terms of broad areas of human activities and educational disciplines rather than specific vocational preparation.

The junior high school elsewhere

In several countries of the world which in one way or another have been influenced by American practices during the past half-century, similar modifications of the educational system have been made in order to provide a better transition between primary and secondary school. In Canada, a similar system has evolved in certain of the provinces where the three-year junior high school provides a lower general secondary education for all pupils before they go on to general or vocational senior secondary schools, while in other provinces various experiments in reorganization of the primary school are taking place.

In New Zealand, attempts to reorganize the work of the 11–14-year-olds had been made in the latter part of the nineteenth century, but without any permanent results. In the 1920s attempts were renewed in two ways: sometimes the top two classes of the eight-year primary schools were transferred to the secondary school to form an attached junior high school; sometimes—and more often—these classes were established as a separate school. For some time there was little agreement on the proper length of the junior high school, two, three- and four-year courses all receiving some support. The question was further prejudiced by administrative divisions: there was a complete administrative separation between the education boards which controlled the primary schools and the boards of governors of the secondary schools, and the teaching service was similarly divided; none of the parties wished to give up any of their schools and therefore the length of the course could not be settled on purely educational grounds. After a period of slow growth it was recognized that the most practicable form of reorganization would be to develop a two-year intermediate school which would remain under the control of the primary education boards and would be staffed in the main by primary teachers. The school was left free to develop three- or four-year courses of a terminal nature for children of low scholastic ability who would not go on to the high schools. In practice this has seldom occurred, and the school has remained an intermediate unit between the primary school and the comprehensive high school. By being a centralized school, grouping together the last two classes of several local primary schools, the intermediate school has been able to provide facilities, equipment, and specialization in staffing which the local primary schools could not provide, and in

these ways to smooth the transition from the primary to the secondary stage and enable the pupils to enter the differentiated courses of the senior high school with less chance of being wrongly allocated or of choosing unwisely. As in the United States, the fact that the pupils almost all proceed to a comprehensive high school eliminates the terminal function of the intermediate school. Moreover, it obviates the need for selection for further education. Untrammelled by external selection examinations, the schools are free to adapt their work to their conception of both the common and the exploratory functions of education for young adolescents. For the majority of children they appear to have bridged the gap between primary and secondary schooling with a considerable measure of success, but they receive a great deal of criticism from secondary school teachers on the grounds that the scholastically able pupils still do not begin subjects like foreign languages and mathematics at an early enough age, that the beginnings of such subjects need to be undertaken by secondary school specialists, and that they cannot be properly undertaken by the present intermediate staffs who, in the main, are primary school teachers by training and experience; and they are often criticized by their own teachers for keeping their pupils for too short a time.

In most countries that have adopted the pattern of a comprehensive junior high school, this is followed by a differentiation into various types of senior high school rather than by a comprehensive senior high school. This is so in the Republic of China and in Japan, and it was recommended for the European population of the Union of South Africa by the Commission on Technical Education in a report published in 1948. Though little has yet been done to implement the commission's recommendation, the report is worth quoting as it sets out the problem very clearly. The school system in South Africa was initially a seven-year primary school, branching out into various kinds of secondary schools providing courses of varying lengths in commercial, technical, and general education. The commission was concerned to bring about a closer relation between general and vocational education at the secondary level, and to prevent too early a specialization of pupils in separate vocational schools. It proposed a complete reorganization of the system in such a way that after the primary school there would be a three-year junior high school for all children between the ages of 12 and 15. In the words of the commission: 'It would be a school for the junior adolescents designed precisely to meet the educational needs all junior adolescents have in common. Its major functions would be the provision of full-time fundamental general education and determination of the aptitudes, interests, and other personal qualities on the basis of which its charges have to make their study and career plans'.[1] In order to achieve these objectives the commission considered that the junior high school would have to provide a rich and varied curriculum that would allow all pupils to try out their aptitudes and their interests, and it noted that 'the new junior high school's biggest problem will thus be provision for individual differences, a problem which may at first sight seem to defy solution. The commission wishes to point out that adequate differentiation has always been and is still today secondary education's unsolved problem and that the throwing together of pupils of various levels of ability and scholastic achievement is not unknown in our school system'.[1]

The distinguishing feature of the junior high school is, indeed, its attempt to provide for the orientation of its pupils towards the various forms of education and vocation that branch out for them later, either in differentiated general and vocational schools or in comprehensive senior high schools. Orientation becomes not a sudden act that takes place at the point of transition, on the basis of hurried interviews or brief examinations, but a process that is continued throughout the junior secondary period in a school whose curriculum and organization are designed with guidance in view. Various methods are used, but all involve the keeping of cumulative educational records of the development of each pupil's abilities and interests, so that when the time comes for decisions to be made about the child's future, both the teachers and the parents will have information readily available on which wise decisions can be based. By discussions with the pupils themselves throughout the junior high school period, the staff, whether they are the general teachers or the special guidance counsellors, are able to help the pupils to play an important part in the choice of their own future education and occupation.

As the basis for obtaining information of value in orientation, the junior high school usually provides optional courses of many kinds, so that each pupil is able to test the degree of his ability and the permanence of his interests by actually trying several different subjects and activities, while at the same time continuing the fundamental studies that are common to all. In this way the junior high schools attempt to give guidance based upon the knowledge gained from a variety of activities, rather than upon the narrower criterion of the pupils' relative ability to learn the scholastic subjects of the general course. Along with the provision of a wider range of school activities there has been an attempt to assess the achievement of the pupils in such a way as to provide the basis for a precise evaluation of their relative strengths and weaknesses. The testing movement has enabled classroom teachers to call upon many reliable and accurate measuring devices to supplement their subjective impressions with more exact indications of their pupils' strengths and weaknesses.

The junior secondary period in selective systems

In most countries of the world today the years of early adolescence, from the age of 11 or 12 to 14 to 15, are considered to be the first stage of secondary schooling for all young people, rather than a period in which some children begin a long course of secondary education, some begin a short course of vocational training, and the majority terminate their primary education and go to work. In countries that followed the European tradition of early separation, the problem is how to bring about, by changes in curriculum and methods, a common approach

1. Union of South Africa, Commission on Technical Education, *Report*, Pretoria, Government Printer, 1948, p.275.

1. ibid., p.340.

to the general secondary education considered necessary for all young people, while retaining those aspects of the differentiated curricula that are useful and are not begun prematurely. In attempting such a reform the question arises whether a unified school is essential at the junior secondary level, or whether separate schools can be retained.

From the point of view merely of smooth articulation between the primary and secondary periods, the systems that select early do not appear to be so conscious of difficulties as are the countries that retain the common school throughout early adolescence. The shock of failure remains with those borderline pupils who had hoped in vain to enter the selective grammar school, *lycée*, *Gymnasium*, or similar school; but for those who are selected the actual change-over from the primary school to its successor is not severe, because each type of secondary school appears to have its own mode of education fairly well adapted to the abilities of the pupils who enter it. The most intelligent and scholastically inclined pupils entering the selective school at 10 or 11 are ready for wider experiences and more systematic studies than the primary school has provided, and as the course they are entering is intended to be a long one their studies in the new secondary subjects can be initiated without undue haste and pressure. In the same way, the less able pupils entering the middle school undertake a curriculum less academic than that of the most highly selective schools and beginning with fewer strange new subjects. The majority of the children entering secondary modern schools or their equivalent, or completing their education in 'complementary' or continuation classes attached to their primary schools, find that they are essentially continuing with a 'rounding off' of their primary school studies and thus for them, too, there is no severe problem of transition.

The most serious problems in the systems that select early are of a different nature. They are the problems of making a just allocation of the pupils among the different types of school or course and of providing them with the kind of education best suited to their needs. From both these directions there are pressures that seem likely to cause more and more systems to develop a common non-selective period of junior secondary schooling. It is increasingly realized, from the efforts to devise good allocation procedures, that a longer period of common educational opportunity is needed to provide variety and choice as a means of orientation. It is becoming clear, too, that socio-economic factors still operate strongly and may unduly influence educational choices made at an early age. For example, surveys recently carried out in France showed that a considerable proportion of children did not even sit for the examinations on which allocation to the *lycée* or the *collège* is made, and that these children were almost all from working-class families. It was considered that this waste of potential talent might be reduced if these young people had a period of further orientation in which to try themselves out at various secondary school studies. The opinion is increasingly held, too, that in the modern world all adolescents need a longer period of general education before entering the phase of differentiated training, and that there is more chance of this being well done in general secondary schools than in specialized vocational schools.

For both the above reasons it seems likely that further attempts will be made in Europe, in South America, and in the East, to devise some form of common schooling in the junior secondary period. For the majority of European systems, and indeed for the majority of systems throughout the world, this will involve a radical reorganization of the schools. In consequence, in so far as such reorganization is likely to be in the direction of creating a period of common junior secondary schooling, it is quite likely that the problem of transition from basic primary education to the curriculum of the senior secondary stage will arise in the future as it did earlier in the undifferentiated systems.

Reorganization itself is taking two main forms at the present time. On the one hand there is the extension upwards of the common primary school to include a junior secondary top. This is the method of the unified school; it is found in the seven- and eight-year incomplete secondary schools of the Union of Soviet Socialist Republics and similar systems and it is essentially the method that Sweden's nine-year unified school will follow. On the other hand, there is the junior high school and the junior-senior high school that developed in the United States and a few similar systems. This is the method that Japan has adopted and that some countries in the Middle East and Asia are developing, and it is finding advocates in several of the Western European countries.

Reorganization at the secondary level only appears likely to find most favour among those countries that have inherited complex secondary systems separate in origin and control from the primary systems, and that have not made any revolutionary break with their recent past. In Scotland, for example, the smaller urban centres often have only one secondary school, and in it the junior secondary stage of education is common to all children whatever the length of their course. In England, the number of comprehensive schools, multilateral schools, and bi-lateral schools is slowly increasing, and one county (Leicestershire) adopted in 1957 a plan that is in effect similar to the junior high school pattern. The essence of the Leicestershire plan is that in an area containing a grammar school and a number of secondary modern schools, all the children will enter a secondary modern school for their first three years of non-selective junior secondary education. At the end of this period, those pupils who intend to continue with their studies for several years will transfer to the grammar school, which in effect will become a senior high school with a three- or four-year course. The remaining pupils will stay at the junior school until they reach the minimum leaving age and will then end their schooling.

The Leicestershire method is intended to solve one of the problems of the comprehensive school that has caused much concern in Britain, and indeed in any country where a high degree of selection has been practised. It is considered that the grammar school, the *lycée*, and other similar types of selective schools should be of a size large enough to have several classes in their final year, in order to provide for the specialization that is required in preparation for the university. A comprehensive school would have to be very large indeed (1,500 to 2,000 pupils) if it were to have several classes of very able pupils pursuing highly academic courses within it. Schools of this size, however, are not regarded with favour in Great Britain,

and the horizontal division into junior and senior sections would reduce their size.

In Italy, a method of gradual unification has been adopted which may provide an example for systems that are still differentiated at the junior secondary level. In the first years of the twentieth century, Italy had a secondary school system that comprised a five-year *ginnasio* followed by a three-year *liceo* which led to the university; technical schools of two grades, a three-year lower school followed by a four-year upper school; three-year schools for the training of primary school teachers; a complementary school of three years; and classes for apprentices. The reform of 1923, initiated by Giovanni Gentile, replaced the teacher training school by an *istituto magistrale*, divided into lower and upper divisions; the three-year technical school was replaced by a four-year school specially designed to provide a general humanistic education to serve as the introduction to all types of higher technical institutes; many private vocational schools were placed under the supervision of the State and their curricula reorganized on a common basis; and a new type of upper general secondary school, the *liceo scientifico*, was founded. In 1932 a further unification took place, by which the complementary schools and the apprentice-training classes were converted into *scuole secondarie di avviamento professionale* or general secondary pre-vocational schools, and were given the task of providing continued general education and pre-vocational training for pupils up to the age of 14. The next step in unification took place in 1940, when the lower courses of the technical institute, the teacher training institute, and the *ginnasio* were combined into the three-year *scuola media*, a lower general secondary school, the purpose of which was to give its pupils a general education in the humanities and at the same time provide them with the opportunity to test their abilities and aptitudes so that they would be able to make a better choice of their future vocation and education.

All secondary schools had been intended to provide a common junior education, but in practice the lower course of each was greatly influenced by the nature of its upper school. Each prepared its junior pupils for the work of the upper school, with the result that it was not easy for a change of school to be effected if the pupil discovered that his original choice had not been wisely made. The 1940 reform has brought about a gradual simplification of the school system at the junior secondary level, so that, apart from a few special schools such as those of the fine arts, there are only two branches of education to choose from at the end of the five-year primary period.[1] The three-year courses in these two types of school are carefully articulated with the courses in the senior schools to which they lead, and for those children who continue to the appropriate senior schools the transition is made with relative ease if they have entered the right school and their abilities and interests have not shown any marked change. Difficulties occur, however, with the pupils whose allocation in the first place may not have been correct. The distinction made between the selected pupils of the *scuola media*, who are considered fit to prepare for the long course of senior secondary schooling in the *ginnasio* and *liceo*, and the majority of pupils who enter the *scuole secundario di avviamento professionale*, is regarded by many Italian educators as undesirable, for they consider that the pupils at entry are too young for their aptitudes and interests to have clearly manifested themselves. The problem of forming a common lower secondary school for all pupils is a difficult one, however, owing to the great importance attached to the long course of humanistic education in the *ginnasio* and *liceo* and the consequent anxiety lest the most able children might not receive an appropriate preparation in a unified junior secondary school.

The reduction of types of secondary school diminishes considerably the number of pupils who make a wrong choice or who are wrongly allocated at the end of the primary school period. Mistakes inevitably occur, however, and the interests and abilities of some pupils will change. Each type of school tries, therefore, to make some provision for the borderline pupils and thus prepare them for a possible change. With the growth of an educated population, more and more parents want their children to have as extended an education as possible, and there is a steady pressure upon the non-academic junior secondary school either to make provision for its pupils to continue in senior secondary schools or to extend its own courses upwards to the senior level. The latter method is frequently regarded as more satisfactory for the pupil, because transfer from one type of school to another is never easy, and in practice it takes place only occasionally. The latter method is also favoured by both parents and teachers, as it raises the esteem of the school to be permitted to prepare its pupils for the leaving certificate examinations. In the secondary modern schools of England, an increasing number of pupils are now having 'grammar school' courses offered to them, so that they can sit for the General Certificate of Education examination, and it appears that this method of reducing the distinction between different types of school is likely to become popular. In effect, too, it is a method of making a smoother transition from primary to academic secondary education for borderline children in a system that retains selection and differentiation.

Transition in the unified school

Many of the problems that present themselves in those school systems that are trying to bring about a smooth articulation between primary and secondary education appear to be avoided in countries like Denmark and Sweden, the Eastern European States, and the Soviet Union which have established a unified school system covering both the primary and the junior secondary stages. In the first place, from the point of view of the pupils themselves there is just one school through which all children progress from the age of 5 or 7 to the age of 14 or 15. Even to those pupils from rural areas who enter the junior secondary division after they have completed their earlier education in a village school, it will be clear that the new school they are coming to is not a separate secondary school, for the young children of its own district are still in attendance. In the second place, pupils growing up in the unified school will find less change in school customs,

1. In 1960, Bill No. 904 was placed before the Italian Senate, establishing a single unified lower secondary school which will replace the present *scuola media* and *scuola di avviamento professionale*.

regulations, and discipline as they pass from classes that were formerly thought of as primary to those that were formerly classified as secondary; and though they will have new teachers, these will all be part of the same staff and will be recognized as such by the pupils who will have seen them in the school buildings from time to time. In indirect ways such as these the child will be aware that he is growing up in one school and not passing from one type of school to another at the age of 11 or 12.

It is, however, quite possible, that in spite of these evidences of unity the formal programme of studies and the methods of teaching of one section of a school could be markedly different from those in another section. Being housed in the same school does not necessarily bring about a functional relation between the work of the different classes. This has to be deliberately striven for in the organization of the school.

In all the countries that have adopted the unified school through the primary and lower secondary stages, the trend has been towards a constant improvement in the articulation of the programmes of study, in the gradual introduction of new subjects, and in the adaptation of teaching methods to suit each stage of development of the different subjects. The Ministries of Education in many countries that are developing a unified school have made it one of the main functions of their departments of educational research to improve the curricula, methods and textbooks. Courses of study in any given subject are worked out in long, carefully planned sequences of several years, extending from the primary through the secondary stages, and divided up suitably for the different classes.

As an example of the carefully graduated introduction of new subjects of the curriculum, the present practice in Bulgarian general polytechnical secondary schools may be noted. In the first classes of the primary stage the major part of the time is spent on learning to read and write the Bulgarian language, and about half as much time is devoted to arithmetic. In addition there are singing, drawing, productive work experience, and physical education; handwriting is included in the language studies in the first three classes, and in the fourth class, the amount of time devoted to language is decreased to enable new studies such as geography, history and civics, biology and geology to be introduced. In the fifth class, which can be said to mark the beginning of the junior secondary period, the first foreign language, Russian, is begun; in the sixth class simple arithmetic is superseded by algebra and geometry, and physics begins; in the seventh class chemistry starts, and a Western European language is begun; and in the eighth class a one-year course in crop and stock management is provided. In the senior secondary period, which begins at the ninth class, the general production work period ceases but further additions are made to the programme: drawing merges into technical drawing and designing, trigonometry enters the mathematics syllabus; one-year courses in psychology and logic, in rural mechanization, and in the elements of machine operation are provided; a two-year course in shorthand begins; and additional music and drawing are provided as options. In the tenth class a beginning is made with specialized vocational training, both theory and practice; in the eleventh class, singing is dropped and practical electricity is taken; and in the twelfth class biology and geology are dropped in favour of astronomy, and a study is made of the elements of communist theory.

After the pupils have completed eight classes many of them go to specialized technicums, where general education is continued and the same principle of the gradual introduction of new subjects is applied to the specialized technological subjects that complement the general course.

The unified school systems give indications of a trend in curriculum organization that is likely to be followed in other systems, too, in order to achieve an efficient transition from elementary studies to those that have traditionally been regarded as secondary. In countries like the United States of America which have unified district control of all stages of schooling, it is increasingly common for the programme of studies in a given subject to be considered as a whole from the lowest to the highest class even though in terms of organization these classes are divided up into different schools at different stages. In countries where there are still distinctly different controlling authorities for primary and secondary schools, however, the situation is more difficult to cope with. Attempts at voluntary co-operation between the primary and the secondary teachers and the primary and secondary inspectors are being made in many countries through joint curriculum planning committees, and through local agreements and consultation between schools; but it is difficult to make sustained and comprehensive efforts at articulation by such means alone, and the results vary greatly in effectiveness.

Transition and teaching methods

The general trend towards giving all children the opportunity to complete at least the first stage of secondary education has involved something more than a mere change in nomenclature or terminology. The secondary education now being given to young people in the advanced classes of the primary school, the *cours complémentaires*, the junior high school, the secondary modern school and so on, is no longer the same as the old continued elementary education. In fact the quality of education in the primary schools has changed greatly in the more highly developed countries over that period, and the change has been in the direction of bringing primary school teaching methods nearer to what has been regarded as the intellectual ideal of the secondary school. This is true even though the secondary schools themselves may not have been successful in living up to their own ideal of cultivating in their pupils an active, searching intelligence, seeking to comprehend man and his culture and not merely to memorize facts of whose significance they are unaware. The changes in primary school methods have of course gone deeper than this, for they have been concerned with the development of the whole personality of the young child and not with his intellect alone, but it is on the intellectual side that the primary school spirit has come nearer to that of the traditional secondary ideal.

Much of the best pedagogy in the primary schools has been achieved when skilled teachers have been able to make their pupils' own interests the starting point of intelligent activities that lead to an understanding of matters that the pupils are concerned with and that

involve the acquisition of knowledge that it is important for them to have. But it is generally considered that the interest-centred approach has to be modified at the secondary level, where a more systematic organization of knowledge is called for. It may be noted in passing that in many countries today educators are concerned about the overloading of the secondary school curriculum, owing to the increasing amount that young people are expected to learn. Their anxiety has two main aspects: first, the mental strain placed upon the young people by the long hours of schooling and learning; secondly, the difficulty of avoiding an emphasis on memorization and the consequent neglect of the inquiring mind that wants to pursue interesting topics to their limit. However, even though the secondary schools may have been forced in recent years to over-emphasize systematized knowledge, it is generally considered that at the secondary stage systematization is called for, especially for the academically able pupils, and that a transition is necessary here between the relatively interest-centred pedagogy of the primary schools and the subject-centred pedagogy of the secondary schools.

In those countries that have had fairly advanced methods of training teachers for the primary school for many years, in which the entrants to the primary teaching profession have usually completed a full course of secondary education before entering the pedagogical institutes, and where modern knowledge of child psychology has been readily available, the use of activity methods and attempts to release the creative powers of the children in the course of school learning have, over the past two decades in particular, begun to influence the atmosphere of the junior secondary schools. In Belgium, France, Great Britain, North America and Switzerland, notable developments in the application of the psychology of creative activity to schooling have been made in the primary schools, and with the transformation of the upper primary classes into secondary schools the junior secondary schools themselves have been affected. Activity methods, such as those pioneered in the United States at the Chicago Laboratory School in the early years of this century, in England at the Perse School at the time of the first world war, by Decroly in Belgium, and in the *classes nouvelles* of France after the second world war, are increasingly being used within the organized subject-areas of the junior secondary school to smooth the transition from primary to secondary studies, as well as to give life and reality to these studies.

Several features of the *classes nouvelles* are worth noting in this context. First, in order to make an easier transition between the primary school where one teacher takes all subjects, and the secondary school where every teacher is a specialist and many new subjects are commenced, a grouping of subjects was often made, so that the pupil might have only three different teachers for the major intellectual subjects during the first two years. This is a method which is increasingly being used in many parts of the world. For example, one teacher may be responsible for the teaching of the native language and also the social studies such as history and geography; another teacher may take mathematics and the sciences; while a third may take the foreign languages. Secondly, several school periods each were set aside for individual directed activities instead of class lessons. By this means the teacher was able to spend a considerable amount of time giving individual attention to his pupils, and the pupils were taught how to study and investigate effectively on their own. In these periods, project-work and activities based on centres of interest, were carried out as well as the customary book-learning or working of exercises, and an incidental benefit was that the amount of homework could be reduced. Thirdly, in the ordinary school periods, a sustained attempt was made in many schools to break away from lecturing by the teacher and passive listening by the pupils, and from an excessive amount of textbook memorization. A variety of modern methods was used, such as the carrying out of small researches, the preparation of lecturettes, monographs, models and exhibitions, and dramatization by individual pupils and by small teams working together. In general, an effort was made to release the child's powers of creative activity, to direct these into the main fields of human culture, to show the unity of human culture, and yet at the same time to encourage each child to make a distinctive contribution by developing his own best talents in whatever subjects and through whatever media they might best express themselves.

The practices of the *classes nouvelles* provided a stimulus to all junior secondary classes, not only in France but in many other parts of the world, even after it was decided, for reasons of economy, that they could not be continued in their original form. For the adequate realization of activity methods, few countries at the present time have enough teachers to reduce the size of classes; and few classrooms are designed and equipped on the scale needed, but tend still to be places where children sit and listen and write. From many parts of the world today, indeed, comes a consistent criticism of secondary education that it still over-emphasizes memorization and neglects more active approaches to learning. However, it is a feature of new school design in many countries that classrooms are coming to be considered as study-work rooms and that schools, both at the primary and the secondary level, are being planned to enable a wide variety of activities to be carried out in them. In such ways, too, the tendency to close the gap between primary and secondary schooling can be seen.

The use of more active learning methods requires teachers who are well educated and not merely well trained. The experience of those who are creating educational systems in the underdeveloped areas of the world shows that a teacher with only a limited knowledge of his subject and of related subjects needs precise and explicit direction and is most efficient if he restricts himself to methods of formal instruction within the limits of his knowledge. To encourage and guide his pupils into more active methods of inquiry, a teacher needs a very deep knowledge of his own subject and also a broad knowledge of its relationships throughout the field of learning. If he has not both this breadth and depth, he will be unable to act as guide to his pupils, and their activities all too readily get lost in blind alleys. The trend towards a more active pedagogy, then, is intimately connected with the quality of the education and training of teachers, and thus varies greatly from area to area throughout the world today.

In educational systems that are still struggling to establish themselves, as in the new primary systems of the vast undeveloped areas of Asia and Africa, where

the basic problem is to obtain a supply of teachers just well enough educated themselves to be able to lead their people to the fundamentals of literacy, it is generally considered that the prime need of this generation is for effective instruction, limited in its scope and its objectives. The same situation appears to exist at the secondary level in systems like those of some of the Latin American countries, whose educators have repeatedly pointed out in recent years the need to advance beyond the methods of dictating and memorizing lecture-notes compiled by the teachers. But until sufficient buildings, textbooks, teaching materials and school equipment can be supplied, and until a large enough body of professionally-trained full-time teachers is available, such deficiencies will be difficult to overcome.

Teachers for the junior secondary school

The growth of the idea that all kinds of schools provided for the young adolescent are to be regarded as giving secondary education is transforming the nature, supply, and training of their teachers. However, in the field of teacher training the division between primary teachers and secondary teachers persists in many parts of the world and presents difficult problems, particularly where primary teachers are trained in institutions at secondary level and secondary teachers at higher level.

In countries like France and Great Britain where the young people from 11 to 15 attend different types of school, some of which were originally part of the primary system, some of the technical system and some of the traditional secondary system, the marked difference in the training of the teachers that characterized the earlier situation still persists. It is one of the factors in the refusal of the general public to accord to the new secondary schools that parity of status which educators see as necessary if parents are to accept willingly the allocation of their children to different schools on the basis of aptitude and ability. Efforts are being made to raise the qualifications of teachers in the secondary modern schools and to bring them closer to those that have been customary in the traditional secondary schools. As, however, the traditional secondary schools are themselves short of teachers owing to the great increase in their enrolment since the second world war, only slow progress is being made. Moreover, the problem is not simply one of staffing the modern schools or the technical schools with university graduates with the same qualifications as those that have traditionally staffed the grammar schools and the *lycées*. The kind of curriculum most suitable for the education of the majority of young adolescents, as distinct from the intellectual minority, may require different qualifications. These have yet, in fact, to be satisfactorily defined and appropriate training programmes established, and one of the functions now being fulfilled by the secondary modern schools in Great Britain is that of discovering by experience the kind of teachers and the kind of training needed for the education of adolescents of average ability.

It has already been mentioned that in countries like New Zealand, where secondary education in the past commenced at a relatively late age after eight years of primary schooling and where recent attempts have been made to create a common junior secondary period out of the last two years of primary schooling, most of the teachers in the intermediate schools are primary teachers, and this has had the effect of retarding the introduction of subjects like foreign languages, mathematics and physical sciences into the junior secondary classes. At the same time, when the secondary schools proper are comprehensive schools, the great increase in the number of children of average and below-average intellectual ability entering their lower forms has faced the staff with new problems of curriculum and teaching methods for which they have not been prepared. In an effort to cope with such problems many secondary schools have been recruting primary teachers to their staffs, and the constitution of secondary school staffs is in this way being changed.

It is noteworthy that in Sweden, where the experiment of the *enhetsskola* has been most carefully prepared for, special teacher training institutions have been established to determine appropriate methods of preparation for the work of the junior secondary stage and to ensure a supply of suitably trained teachers, so that the success of the reorganization will not be prejudiced by teachers unsympathetic towards it and unqualified to cope with its most difficult problems.

TOWARDS AN INTEGRAL EDUCATION

Throughout the world, over the past two decades in particular, the view has been increasingly accepted that education is a continuing process from childhood to adulthood, and that schooling should not be conceived of as comprising two radically different kinds of educational process, one primary and one secondary, for two different kinds of children, whether these different kinds of children be separated one from the other on socio-economic grounds or on the basis of their abilities and aptitudes. The terms 'primary schooling' and 'secondary schooling' are coming more and more to be considered as no longer referring to different entities, but rather to successive phases of a continuing process that cannot be sharply distinguished except arbitrarily and by doing violence to the real continuity of growth and education. In so far as school systems and scholastic methods do break the continuity of growth they are coming to be regarded as imperfect instruments of education.

Along with the growing acceptance of this integral view of education which leads to the abolition of the former sharp distinctions, is a growing acceptance also of the belief that all young people should receive as complete an education as it is possible for their communities to provide. The first stage in the acceptance of this belief is reached when it is realized that a nation loses much of its potential talent if it denies educational opportunity to the able young people of the poorer classes of the community; the final stage is reached when it is realized that a community is neglecting its human resources unless it gives to even its least able members the chance to continue to grow and develop as long as growth is possible. The corollary to such views is that communities try to develop a system of education that will be always available to all their members. That is a long term aim. In the meantime,

the provision of schooling for all children and young people up to the beginning of adulthood is an objective that only a few economically advanced countries are within sight of attaining, the provision of complete schooling for a proportion of the abler young people is being achieved by a considerable number of countries, while in most parts of the world the objective is still to bring the rudiments of literacy and a few years of basic schooling to the younger children.

Looking ahead to the goal of a longer period of schooling for all young people, the leaders of the underdeveloped areas are faced with two different patterns towards which many of the more advanced countries are tending. The first is that of a sequence of comprehensive schools, divided into separate sections, with a primary school followed by a junior high school and then by a senior high school; the second is that of a unified school from childhood to the end of early adolescence, followed by a diversification at the senior stage.

Each has done away with the former distinction between primary and secondary schools as belonging to different systems for different children; each provides education for all the children of a community; and each in a different way is developing an integral approach to the provision of education that blends together the primary phase and the secondary phase into one continuous process. There are, however, certain marked differences in the two approaches, and it is in understanding these differences that educators will be able to judge whether either of the two approaches is a suitable guide to the future development of their own system or whether new solutions must be sought.

The essential distinction between the two methods appears to reside in a different conception of the nature of the school at its most senior stages. The comprehensive senior high school aims at providing a complete education up to the age of 17 or 18 for all young people no matter how able or, within the limits of normality, how low in scholastic ability. It seeks a method of blending general education and vocational training within an institution where the basic aim is the cultivation of the whole human being not merely the training of a skilled worker. In pursuance of this aim it will not reject young people stage by stage because they do not reach certain standards of scholastic attainment. The system that has a selective senior secondary school, on the other hand, sets out to achieve a more limited objective: to develop a highly qualified pool of academic and technical talent by striving for high standards of scholarship throughout the school system, and by allowing young people who cannot reach these standards to leave the secondary school at the end of the junior phase and continue their education in different ways. It is not the conception of education that differs in the two systems so much as the conception of schooling. Each aims at a complete education for its young people, blending cultural and vocational elements. The diversified schools to which young people will go when they leave the general secondary school are no mere vocational training institutions but place a great emphasis upon general education at the same time.

In systems that differ in this way the nature of the schooling given at the junior secondary stage tends to differ also. Where the senior secondary school is mainly concerned with a scholastic minority, the junior secondary school also tends to be progressively more academic, and those pupils who are unable to keep up with its exacting standards will leave and enter different educational institutions. When the senior school is comprehensive, however, the junior high school tends to provide a wide range of alternative educational programmes, academic and non-academic, to enable its pupils to learn to choose wisely their future course of schooling from among the diverse offerings of the senior high school. In order to provide for a wide range of abilities and to offer a wide range of optional subjects, the comprehensive high school needs to have a large number of classes at each age level to be able economically to provide a large staff of specialist teachers and specialized teaching material. This would make it impractical to join the six classes of the primary school on to the six grades of a junior-senior high school; and indeed, one of the reasons why the junior and the senior high schools are often separate is that in this way the size of each school can be large enough for diversification without being too cumbersome.

CHAPTER VII

TRENDS IN THE SECONDARY SCHOOL CURRICULUM

Even more significant than the changes that have been taking place during the present century in the structure and organization of school systems are those concerned with the nature of the curricula designed for adolescents. For the essence of these changes is that they stem from an awareness of the need not merely to make more education and training available to all young people, but to provide an education which will develop in all young people, to the fullest extent of which they are capable, those qualities of character, personality, and intellect traditionally associated with the concept of a 'liberal education'. At the same time, the attempt to use the traditional curriculum, originally intended for children of the upper classes of European society, as the means of development of children from different social strata and with different backgrounds and interests, has led to a careful examination of the relation between the curriculum of a school and its aims. The result is that in many countries the opinion has become generally accepted that different curricula and methods of teaching may be needed with different children, even though the same general objectives may be aimed at. Finally, the rapid expansion of human knowledge and the rate of technological development demand a constant re-thinking of both the aims and the methods of education. In consequence of all these factors the original distinction between primary and secondary education, as connoting two qualitatively different types of education suited for different sections of the community, has now almost disappeared. Furthermore, the later view, that primary education is the education of children while secondary education is the education of the adolescent and that there is a marked qualitative difference between them, is giving way to the view that the process of education is a continuous one in which changes in curriculum and methods should occur gradually. Indeed, in countries that are developing the unified school the terms 'primary' and 'secondary' appear to have little value even administratively and seem to be dropping out of use.

THE CURRICULUM AND THE NEEDS OF AN EXPANDING ELITE

In the eighteenth century and the earlier part of the nineteenth, in those countries that had begun to develop modern school systems secondary education was still regarded as the means of cultivating the 'free' man, the man who, by virtue of the ownership of property or some other form of wealth, did not have to work for his living in the usual sense of the term, but was free to cultivate his talents and personality as thoroughly as possible in order to lead a full life and be fit for the responsibilities of high office in the service of the State. The distinction between the 'free' man and the worker tied to his occupation caused a separation between education for culture, which was the privilege of the upper classes, and training for a specific trade or manual occupation, which was the fate of the lower classes. In the Western countries, after the renaissance of Greek and Roman learning, the content of higher education was fundamentally the study of the literature, the fine arts, and the practical arts of the civilizations of classical antiquity. It was the essential function of the grammar school to teach the languages of Greece and Rome, which were seen to be the key to classical learning.

Yet as early as the seventeenth century and throughout the eighteenth century, the expansion of commerce and the great scientific developments that were taking place in the European nations were bringing a realization that the humanities alone, however permanent their essential virtues, were too narrow in scope to provide the education needed in the modern European civilization. Educational reformers pressed the claims of the newer scientific and technical knowledge, of modern foreign languages, and of commercial and economic studies. Gradually all these fields of learning came to be included in the work of the educational institutions that catered for the needs of the adolescent.

The status of the newer subjects was initially much lower than that of the classical studies. Their inclusion in the curriculum was largely dependent upon the growth of the commercial and industrial middle classes, who envisaged for their children studies that were more closely related to the practical affairs of their lives than was the classical curriculum. New types of schools were set up to teach the modern studies, but they had a hard struggle to gain the privilege of preparing pupils for higher education. In some countries, for example Germany, there was a proliferation of types of schools according as they taught Greek and Latin, or Latin and modern languages,

or modern languages and science, and so on, and at first these schools themselves formed a hierarchy of privilege. In England and North America, on the other hand, while the academies were at first founded to teach the newer studies, the older grammar schools themselves enlarged their curriculum and by providing classical 'sides' and modern 'sides' in the one institution avoided much of the struggle for institutional privilege that characterized countries where any new emphasis in curriculum was achieved by creating a new type of school. Nevertheless, the newer courses were seldom accepted as qualifying for entrance to the university, and in consequence they were often taken by pupils who were not considered to be of such high intellectual calibre as those on the classical side. The struggle for parity of status by courses that emphasized modern languages or the sciences rather than classical languages was strongly in evidence during the latter part of the nineteenth century in those countries of the West that were becoming industrialized, and by the beginning of the present century the content of secondary education was regarded almost everywhere as comprising the mother tongue and its literature, the Latin and/or the Greek language and literature, classical history, one or two modern foreign languages, mathematics, some of the natural and physical sciences, and some modern history and geography.

The emphasis placed upon these different subjects varied from country to country, and the variation appears to have been due to the operation of two major factors. The first was the extent of commercial and industrial development in the countries concerned, and the second was the extent to which secondary education was being made available to the lower sections of society. In the first place the classical elements of the curriculum, including not only languages, literature, and ancient history but also the classical mathematics, retained their strongest hold in the less industrialized countries, in which the main source of productive power was the manual labour of the majority of the population, in which there was a relatively small middle group of highly skilled professional and technical experts in either industry or the learned professions, and in which a small group of wealthy people lived by ownership of property and monopolized the highest offices of government. It is notable that in the countries of Europe where industrialism developed late the secondary curriculum has been slow to emphasize the sciences and, what is even more interesting, in countries that have developed as modern States from being unindustrialized colonies of European powers the growth of modern studies, too, has been slow. For example, in many Latin American States it is only in recent years that the secondary schools have begun to make serious attempts to overcome the inadequacies under which their teaching of the sciences has laboured. In India and Pakistan, too, and in other newly emerging independent States of Asia and Africa, where the children of richer families have in the past been sent to Europe to obtain their higher education, the secondary schools have emphasized linguistic studies until quite recent years. This has meant that their university graduates have tended to be trained for administrative responsibilities rather than for technological activities, and the pupils who have not gone beyond the high school have tended to be clerks and teachers. Now that these countries have an urgent need to improve their economies they find that they lack not only scientists and technologists but also administrators with technological and scientific backgrounds.

The second factor that had a profound effect upon the broadening of the secondary curriculum during the latter part of the nineteenth centuries was the gradual extension of secondary education to the children of the less well-to-do sections of the middle classes and to the ablest children of the working classes. Only in exceptional cases was it expected that these children would rise to high positions in their countries, because the influence of family and social background still played a very powerful role in preferment to high office, but they were intended to be prepared for the learned professions and for middle-level administrative positions in industry, commerce, and the public services. Subjects of more immediate utility than the classical languages were admitted into the curricula of secondary schools for the benefit of such pupils, and although these subjects were not at first accorded the prestige of the ancient ones, in the end they did allow the pupils to enter the universities, though not always to those of the highest social prestige nor to all the different branches of university study.

In most countries, however, the differences in the curricula for the different sections of secondary education were not great and a large proportion of the subjects taken was common to all types of secondary school or courses of study. In the less industrialized countries there was little differentiation until the last years of secondary education, and even in the United States of America, at least until the first decade of the present century, the requirements of university entrance tended to retain a large common element in the curriculum.

Fundamentally, the schools were still adhering to a common conception of the nature and purpose of secondary education; however much their curricula varied in detail, the common element was essentially the conception of a humane liberal education that derived from Aristotle. It was a conception that emphasized the mental life of man, especially in its intellectual aspects, as this was regarded as the highest of human characteristics and the one that could be developed only by man freed from the bondage of manual labour. The *artes liberales* of the Romans could be pursued only by 'free' men; in mediaeval times the seven liberal arts of the *trivium*, grammar, logic and rhetoric, and the *quadrivium*, arithmetic, geometry, music, and astronomy, were the basis of education; in modern times they became transformed into the characteristic European secondary school curriculum of the late nineteenth and early twentieth centuries.

This, of course, is not to say that the curriculum was the same in all the schools of Europe. There were distinctive national differences between the schools in spite of the common derivation of their secondary curricula, and within any country different schools emphasized different aspects of the curriculum. In Germany, for example, the schools that emphasized classical humanism were somewhat different in character from those that emphasized the life and spirit of German culture, though a large part of the curriculum was the same in both types of school. In consequence the distinctive qualities of the different elites

that were being produced by the various curricula were somewhat more sharply differentiated in Germany in the nineteenth century than they were in other European countries, where curriculum differentiation took place mainly within a common type of secondary school.

The process of expansion of elites took place rapidly in the United States of America during the latter part of the nineteenth century, but here, as in other countries there was a conflict between the nature of the universities and the needs of those children not intending to proceed to higher education. In 1892 the National Education Association set up the Committee of Ten on Secondary School Studies to consider some of the problems arising out of this conflict. Although the committee recognized that the secondary schools of the United States did not exist only for the purpose of preparing pupils to enter the universities, it still considered that they were restricted in their functions, which were seen to be 'to prepare for the duties of life that small proportion of all the children in the country—a proportion small in number, but very important to the welfare of the nation—who show themselves able to profit by an education prolonged to the eighteenth year, and whose parents are able to support them while they remain at school'.

The committee was conservative in its judgement as to the number of subjects that were suitable for the purpose of secondary education. Some specialization was seen to be necessary, and the committee was convinced that superficiality would result from an encyclopaedism that required the pupils to take a large number of subjects for short periods of time. This has to be interpreted in the light of the fact that the American high school of the period offered only a four-year course following upon eight years of elementary education. In order to have a practicable method of determining admission to the universities that would allow for the education of a variety of elites and at the same time bring about some uniformity in the standard of their scholarship, the committee recommended that different groups of subjects should be considered equivalent if they were studied for the same number of years and for the same number of periods per week. This suggestion was endorsed in 1899 by the Committee on College Entrance Requirements, which recognized the desirability of allowing considerable freedom to pupils to choose their subjects within the framework of studies deemed suitable for secondary schools but considered that certain common elements should be taken by all. It suggested that every candidate for university entrance should include four 'units' of foreign language study in his course (with no fewer than two units in any language), two units of mathematics, two of English, one of history, and one of science; he was free to choose the rest of his course from the subjects offered by his school. The 'unit' method came to be generally adopted. The Carnegie Foundation for the Advancement of Teaching used it as one method of evaluating the standard of work in the universities, and the foundation's definition, suggested in its annual report of 1906, that 'a unit is a course of five periods a week throughout an academic year' was generally accepted. Recognizing the arbitrary nature of such an attempt at equating the values of different studies, all the committees had advocated better standards of scholarship and training for secondary school teachers, and they had suggested that secondary school studies should be begun two years earlier so that they could last six years instead of four. The importance of this innovation is that it was a carefully considered attempt to organize the curriculum of secondary schools in such a way that great flexibility in the education of young people for different purposes and positions of importance in society could be achieved, and yet that comparable standards of intellect and scholarship could be maintained.

No other country has gone quite so far as the United States in developing a flexible curriculum adapted to the abilities and interests of its potential university students, yet all countries have been moving away from the rigid and undifferentiated curriculum which during a large part of the nineteenth century was considered to be necessary for the education of a nation's elite. At the present time there is still to be found a wide range of different approaches to the question in different parts of the world. In countries influenced by British educational practices, the earlier stages of the secondary school curriculum for children who are likely to go on to the university are similar, and a gradual differentiation takes place as certain subjects are dropped and the pupils concentrate upon a smaller number of subjects. This is a common pattern in countries as different as Australia, India, Ghana, New Zealand, Pakistan, and several other Asian and African territories. In some of the Western European countries a method of differentiation is adopted whereby different courses are provided which may lead, as in France, to different branches of the institutions of higher learning. In many countries, notably in the French- and Spanish-speaking ones, these courses retain the large number of subjects characteristic of the early secondary years, and the problem of overloading courses and overburdening students has been a worrying one for many years. In the Soviet Union and the Eastern European states generally, a very different approach has been made. The long hold of the classical languages upon the secondary school has been broken and a modern curriculum, largely the same for all pupils, has been instituted. With only some minor modifications according to individual wishes, the curriculum is very similar for all pupils up till the final years of the period of unified schooling; then, however, a diversification of types of school and work experience occurs.

A SECONDARY CURRICULUM FOR ALL

At the same time as the education of pupils in the traditional secondary schools has become more differentiated, a unifying process has been taking place in the education of the great majority of young people who in the past did not have access to secondary education. As we have already seen in an earlier chapter, the general tendency in most school systems was for a separation to be made, at the end of the period of childhood, between those pupils who embarked upon a long course of secondary education aimed at entrance to the university, those who stayed longer at the primary school to complete their elementary education at the age of 13 or 14, those who went to middle school for three or four years to prepare themselves for

minor clerical, commercial, or administrative work, and those who entered specialized trade-training establishments. The qualitative difference that originally existed between 'secondary education' and the rest was based upon a sharp distinction between the general development of the human being and the specialized training of the worker. Before the introduction of schemes for daytime supplementary schooling of apprentices, the difference could be seen in its extreme form in the broad education received by a secondary school pupil and the narrow on-the-job training received by the young person who was apprenticed to a trade.

In the present century it has come to be realized that it is desirable to provide for all young people a deliberately planned educative environment throughout their early adolescence. But the catch phrase 'secondary education for all' means much more than merely 'some kind of education for all adolescents'. Indeed, it has never meant simply that all young people from the age of 11 or 12 should have just any kind of schooling; rather it has meant that that quality of education traditionally regarded as 'secondary' should, as far as possible, be made available to all children from whatever background they come and whatever their degree of ability. At the same time the original conception of secondary education has had to be modified in the process of democratization, so that in fact a new interpretation of secondary education is coming into being, influenced by both the 'cultural' conception of general education and the 'vocational' conception of specific training.

Any attempt to analyse and summarize these trends is made difficult by reason of the fact that two very different approaches to the problem have been going on simultaneously over the past fifty years, the first mainly in the United States, the second in most other countries, and it is only in recent years that their convergence is making it possible to see the outlines of a generally accepted solution to the problem of curriculum organization.

In the European countries and those countries that followed closely the European educational practices, the education of adolescents was divided among many different kinds of schooling, ranging from very short courses of specialized trade-training to long courses of general education. In a pre-industrial society where the need for a supply of relatively unskilled human labour is great, a large proportion of the young people must leave school and go to work as soon as their work can be productive; a country at an early stage of industrialism needs, too, a steady supply of labour that can be quickly trained for semi-skilled work. With the further development of industry and commerce, however, the kind of workers required are not those who have quickly and early developed specialized skills, but those who have more flexible minds, who are better educated in general, and who are thus able to remain adaptable in the face of changing industrial processes and more complicated machines. In consequence, in all countries which, by the early decades of the present century, had developed highly differentiated school systems for different kinds of workers—technical schools, trade schools, middle schools of various types, upper elementary schools, and so on—there has recently been a tendency to lengthen the courses, not by enlarging the specifically vocational elements in the curriculum but by developing a broad general curriculum as the basis upon which vocational specialization is built.

In attempting to provide for the general education of children in the specialized vocational schools, teachers early came to the opinion that the essential values claimed for secondary education, as traditionally conceived, were relevant to the needs of all children and, further, that a large part of the traditional secondary curriculum could be adapted in such a way as to provide a good means of educational development for children of varying abilities. As early as 1912, the annual report of the British Board of Education stated that there was 'undoubtedly a growing conviction that the value of secondary education . . . is not limited to children of exceptional ability, nor is to be estimated solely by the difference which it makes to their worldly prospects. . . . It is more generally felt that . . . the standards of mental and physical development which a good secondary school maintains, and the diffusion of those habits which are formed and strengthened by a corporate school life, are ends desirable in themselves'.

As the century proceeded, more and more elements of general education were included in the curriculum, first in upper elementary schooling and the continuation schools and then in the technical schools and the trade schools. In some countries, for example New Zealand, the technical high schools very early began to provide curricula that were similar in many respects to those of the general secondary schools, while at the same time permitting more advanced specialization in technical options. In Great Britain since 1944 there has been an increasing tendency in the secondary modern schools to include courses very similar to some of those provided in the grammar schools, and the view is generally held that, at least up till the age of 15, the differences between the education of children in the grammar schools and those in the modern and technical schools should be differences not of the subjects taken but of the methods of teaching, the approach made to the subjects, and the kind of materials selected within the subjects for teaching purposes. In France, too, a sustained effort has been made in recent years to ensure that pupils in all types of post-primary school are given a good general education. Recent reforms planned in France are based upon the belief that the evolution of modern technology requires a high general education, both literary and scientific, in as many young people as possible. Wartime experience in many countries showed that people with a higher general education were able to adapt themselves more quickly to new manual techniques than could the more narrowly specialized workers, and the rapidity of changes in the modern world calls for greater and greater adaptability.

The need for a better general education for all adolescents entering a world of automation and atomic power was very well expressed in the *Exposé des motifs* that accompanied the *Projet de loi* placed before the French National Assembly on 1 August 1956.[1] The *exposé* states that the extraordinary rise that has taken place in the proportion of pupils who now stay at school beyond the

1. *Projet de loi portant prolongation de la scolarité obligatoire et réforme de l'enseignement public; projet déposé sur le bureau de l'Assemblée Nationale le 1er Août 1956*, Paris, SEVPEN, 1956, p. 4.

period of compulsory schooling is linked very largely to a general phenomenon noted in all countries whose civilization is comparable to that of France; it corresponds to a fundamental change in contemporary economy due to technological progress. According to statements familiar to economists today, the constant increase in returns from individual work in industry and agriculture tends to diminish the need for manual labour, first within the 'primary' sector and then within the 'secondary' sector; and at the same time it constantly stimulates the development of the 'tertiary' sector. It is reported that in the last century 80 per cent of all Frenchmen were employed in agriculture, 10 per cent in industry and 10 per cent in the tertiary sector, while now 30 per cent are in agriculture, 35 per cent in industry and 35 per cent in tertiary occupations.[1]

Attempts that have been made to foresee the future evolution of the economy of the European nations, for example by studying the changes which have already taken place in the more highly industrialized centres, indicate that in the future an economically well-developed country will be likely to find more than half of its working population in the tertiary services (commerce, administration, liberal professions, transport, health and social services, newspapers, arts, leisure, etc.). This evolution will inevitably cause young rural people to prepare for urban activities that will enlarge as rural occupations diminish. At the same time, the non-technical or semi-technical activities will offer more careers: more teachers, research workers, clerks, agents, secretaries, lawyers, doctors, will be required. More and more workers who in the past needed only an elementary education are being employed in posts which require a longer period of general education, and this is an irreversible trend. Similarly, technological progress is reducing the need for skilled labourers and greatly increasing the demand for highly qualified engineers and technicians. The conclusion which emerged from this analysis was that in view of the changes in industry that are likely to take place, France will have less need for narrowly specialized workers but an increasing need of people with a high general development who can adapt themselves to changing circumstances.

A very different method of giving a common secondary education to all children at the junior secondary stage is being made by States like Sweden and the Eastern European countries that have adopted a unified school up to the age of 14 or 15. With only slight variations the same subjects are taken by all children and, except for the omission of the classical languages, these subjects are substantially those that have usually been regarded as comprising a secondary curriculum. The unified school has, indeed, achieved what the various curriculum changes of other countries are gradually leading to, namely, a curriculum for the junior secondary period which is basically similar in so far as subjects are concerned for all children. In the second stage of secondary education, however, the situation is different, for here a diversification of schools takes place and specialization is emphasized. At the same time efforts are being made to supplement the specialized training with continued general education.

During the period of forty or fifty years over which some of the European countries have been attempting to unify the separate types of secondary education, a different tendency—and in its early phase almost an opposite tendency—was at work in the United States of America and in some of the British overseas dominions. By the beginning of the century the comprehensive public high school open to all pupils had become the accepted means of secondary education in the United States, but the drop-out rate was high. Although this was partly due to the difficulty experienced by some parents in maintaining their children at school during adolescence, the principal factor was considered to be the nature of the traditional secondary school curriculum, which was criticized on several grounds. First, it was considered no longer to satisfy the needs and develop the abilities of the great majority of pupils who were entering the high school; secondly, it did not seem to provide for all pupils the means of 'training the mind' which had been one of the defences of the traditional pattern of subjects; and thirdly, it seemed to have little relevance to the task of helping pupils to understand the modern world. The response of the schools to such criticisms took various forms. Most commonly it was characterized by an expansion of the number of subjects and courses offered. Such courses varied widely, from those designed to give specific vocational training in industry and commerce to those designed to help young people deal with their problems of personal adjustment. Attempts were made on a vast scale to meet what appeared to be the personal needs of the pupils and the local needs of the school districts. It is probably true to say that the high schools of no other country had ever given their pupils so much freedom of choice in the subjects they studied and in the patterning of their courses of study; and a counter-trend has been developing over the past two decades towards a more closely knit patterning of programmes so that in each pupil's school life there will be a continuing group of fundamental subjects supplemented by electives. Many other countries have been influenced by the experience of the United States and, especially in the English-speaking countries, the trend over the past four decades has been to develop a curriculum pattern based upon the idea of a compulsory group of studies of universal significance taken by all pupils, at least in the first cycle of secondary education, together with optional subjects or groups of subjects based upon the educational needs and vocational possibilities of the individual pupil. The extent of this provision of elective subjects and courses of course varies greatly according to the size of schools, the resources of the different school systems and the complexity of the society in which the schools are found.

But whatever the method by which the different school systems of the world are attempting to provide some secondary education for all their children, certain fundamental questions are being forced on their notice. They must decide what are the aims and purposes of secondary education today, and then find the means of carrying them out. This involves consideration of such problems as: (a) the nature of the fundamental common studies to be provided for all pupils; (b) the extent, nature, and timing

1. ibid. See also: Carl Arneson, 'Structure économique et réforme scolaire dans les pays évolués', *International Review of Education* (Hamburg), Vol. III, No. 2, 1957, pp. 74–5.

of differentiation of secondary school studies according to the differences in the abilities, aptitudes, and interests of the pupils—a problem closely related to that of combining the cultural and vocational elements in education; (c) the closer relationship of schooling to the life of the community in which the pupil will live and to the needs of the present day; (d) the best ways of organizing the curriculum.

THE CHANGING AIMS OF SECONDARY EDUCATION

Over the past few decades all countries have shown that they recognize that the great changes in modern society call for a radical rethinking of the aims of education, especially for young people between the ages of 11 and 18. Among the more important of the factors influencing this trend are the scientific and technological revolution and the coming of automation, and the democratic revolution, which is increasing the responsibilities of citizens towards the conduct of national and international affairs.

The appreciation of changes of such magnitude as these has brought about, in a remarkably short space of time, a fundamental re-valuing of the human being and a changed view of what constitutes an appropriate education. In essence, what has happened is that all human beings are now seen as needing and deserving both the kind of general education that used to be termed 'liberal' and the opportunity of developing specific 'vocational' skills.

This re-thinking of aims has been going on simultaneously, at several different levels. At the philosophical level, John Dewey in *Democracy and Education* (1916) made an incisive analysis of the traditional antithesis between the cultural 'liberal' education of the well-to-do section of earlier societies and the narrow vocational training considered fit for the working classes, and pointed the way to a synthesis of these values in a conception of education that would fit all human beings to be at once men and workers in a democratic society. Furthermore, he developed the thesis that mental growth is a personal reconstruction of those aspects of a culture directly related to the needs of the growing child, and is not achieved by the rote-learning of systematized bodies of subject-matter unrelated to his needs. At the same time, committees of practical educators such as the National Education Association's Commission on the Reorganization of Secondary Education were developing a comprehensive set of aims for the guidance of those who, in the schools, had to devise curricula suited to the new conditions. The report on *Cardinal Principles of Secondary Education 1918* set out the most general aims of education in the following statement: '(1) The purpose of democracy is so to organize society that each member may develop his personality primarily through activities designed for the well-being of his fellow members and of society as a whole. (2) Education in a democracy, both within and without the school, should develop in each individual the knowledge, interests, ideals, habits, and powers whereby he will find his place and use that place to shape both himself and society toward ever nobler ends.'

As a means of achieving these ends it was considered that the curriculum of the secondary school should be constructed in such a way that it helped every pupil to conserve his health, develop a command of the fundamental scholastic processes, play his part as a worthy member of his home, prepare himself for a vocation, enable him to take his place in society as a citizen, give him the means of constructively using his leisure and develop his character. Such statements, which in essence were re-definitions and enlargements of the traditional concept of a liberal education in terms of a democratic society, have had a profound effect upon the thinking of educators everywhere, and in most countries of the world in recent years the statements of the aims of secondary education have been conceived in broad terms such as these.

Since the second world war practically all educational authorities have taken the view that earlier conceptions of secondary education were too narrow, that they overemphasized the intellectual aspects of the human personality to the neglect of social, aesthetic, moral, and ethical values, and that they gave too little attention to the everyday needs of the growing adolescent. Typical of the broader view of secondary education now developing is the following official statement of aims from Bolivia: '(a) To preserve and develop the physical and spiritual health of young people. (b) To guide them in the intensive study of the basic subjects and in the use of methods of self-education. (c) To perfect their cultural training and the full development of their personality. (d) To prepare them to play their part in life and engage in productive work. (e) To develop in them a sense of responsibility as individuals and as members of a society. (f) To provide them, through a vocational guidance service, with a programme of studies adapted to their individual abilities and propensities. (g) To inculcate in them a respect for democratic principles, and guide them in putting these principles into practice, thereby preparing them for the conscious exercise of citizenship.'

Similarly, in the Report of the Commission on National Education published by the Ministry of Education in Pakistan in 1960, we find the following detailed statement: 'We consider that in order to fulfil the aims of secondary education in Pakistan, the appropriate education authorities should take the necessary steps to ensure that teaching practice, the content of teacher training and the construction of curricula and time-tables are such as to bring about the full development of the child (a) as an individual, (b) as a citizen, (c) as a worker, and (d) as a patriot. Secondary education can realize these aims if it is directed towards the following objectives:

'(a) *Development of the individual.* (i) To foster in children the spirit of inquiry and independent thought and the ability to apply their knowledge to real life situations. (ii) To relate all teaching to the needs and interests of the adolescent. (iii) So to design teaching and the organization of school activities as to develop the qualities of leadership. (iv) To develop the aesthetic sense and an appreciation of cultural values among children. (v) Through games, sports, and physical education to cultivate in children a liking for and skill in physical activity and the enjoyment of sports.

'(b) *Development of the citizen.* (i) To rear children in the habits of industry, self-discipline and honesty. (ii) To provide full facilities for technical, scientific and other vocational education as preparation for further professional

education or qualification for a career. (iii) To provide the services of educational and vocational guidance and thus direct children towards the most appropriate courses and subsequent careers.

'(c) *Development of the patriot.* (i) To provide a form of education which has its roots in the national culture and in Islamic values. (ii) To nurture a pride in the nation, an understanding of its history and aspirations, and a willingness to serve it. (iii) To create an appreciation of the universal brotherhood of man and a spirit of international understanding.'

The final aim set out in this statement, viz., the development of the patriot, may serve as a reminder that beneath the apparent similarity of aims stated by different countries there are in fact considerable differences. The similarities are to be found at the formal level of generalization: that is to say, in all countries it is now stated that secondary education shall be concerned not merely with the acquisition of knowledge and the development of the intellect of the pupils but also with other aspects of their personality, such as their moral, aesthetic, emotional, and physical development. However, beneath the formal consensus, there may be great disparity of views between countries as to what sort of citizen is the ideal, what particular aesthetic values, standards of judgement, moral principles, etc., are to be fostered.

Countries differ also in the degree to which the implications of their aims are made explicit, and in particular there is a marked difference in this respect between those states that are still influenced by the scholastic traditions of European liberalism and those that are consciously setting out to develop a unified philosophy of life. In the liberal States a plurality of values is accepted in many areas of life, and the Ministries of Education seldom make explicit statements as to the details of belief, attitudes, standards of judgement and so on that are considered desirable. Teachers are expected not to over-emphasize one point of view, but to help their pupils to develop their own outlook in a world of conflicting values. Textbooks are seldom prescribed by the central educational authorities, and even when they are supplied free the individual districts and schools have some latitude in choosing the ones they will use. In a like manner the actual content of the syllabuses of instruction is usually regarded as suggestive rather than mandatory, and is presented in brief outline; the effective syllabus has to be constructed day by day by the classroom teachers. In the countries that do not subscribe to liberalism in this sense, several of the principal areas of life and thought are studied in relation to a unified value-system. States differ most sharply in the fields of politics, economics, philosophy, and religion, but similar differences may occur also in the appreciation of art and literature.

The stating of aims is a different thing from finding the means of putting them into practice, and in many countries there is a gap between the comprehensive aims set out in educational laws and regulations and the actual methods of the schools, which remain bound by older practices, by rigid curriculum prescriptions, by shortages of suitable books and other teaching materials, by an absence of facilities for aesthetic and practical education, by an unenlightened body of teachers, and so on. Many countries have frankly recognized these defects over recent years and are making what efforts they can to correct them. To such countries the aims they set themselves may represent an ideal not to be achieved for a long time to come, but they are an ideal that can serve at once as a guide to their efforts at improvement and as a measuring stick to assess their progress towards their goal. It is true, too, that when statements of aim are couched in terms of high generality they may not appear to be of great practical help to those who are concerned with the planning of the school curriculum in its everyday detail, and that from the one set of highly generalized aims differing approaches to the construction of a curriculum may be deduced. But such reservations as these do not alter the significant fact that the detailed planning of curricula is now being carried out everywhere in the light of aims and objectives thought of as applicable to all young people and as embracing all sides of their being. In some countries, such as Great Britain, the detailed elaboration of curricula is left largely to the individual schools themselves and it is at this level that the search for appropriate curricula is going on. In other countries, Czechoslovakia and the U.S.S.R. for example, research institutes have been charged with the specific task of developing, testing, and revising syllabuses, with the help of experimental schools in order to bring about a closer relation between aim and practice, and on the results of the work of these institutes new syllabuses are likely to be prepared for use in all the schools of the nation. Whatever the means adopted, all countries are undergoing an intense period of curriculum re-appraisal and reconstruction, the major tendencies of which are only now becoming clear.

UNITY AND DIVERSITY IN THE CURRICULUM

The attempts being made in some countries to base the secondary curriculum upon an assessment of the differing needs and interests of the young people, so that an integration will be achieved between the individual's motives for learning and the systematized body of knowledge and values in which much of the heritage of his culture is preserved, raise the question of the relationship between studies that should be common to all pupils, and studies in which some individual freedom of choice is allowed or in which a considerable degree of differentiation of programme takes place. The problem has two aspects: deciding which elements of the curriculum are to be provided for all pupils and which are to be regarded as more suitable for individual specialization; and deciding when and in what manner the process of differentiation should take place.

The common curriculum

Early attempts to solve the first aspect of the problem took the form of trying to provide, within the diverse types of school catering for young people in their early teens, a certain amount of instruction in some of the subjects of the academic secondary course. Usually these were the study of the mother tongue, mathematics, and science, and for a few of the more academically inclined pupils a modern foreign language. At a later stage, how-

ever, particularly as the number of pupils continuing with their schooling beyond the primary stage increased, certain inadequacies in this approach began to appear. In particular, it was found that syllabuses of instruction drawn up expressly for children following the traditional academic course were not well suited to pupils who were likely to be taking only a short course of instruction in preparation for work. The problem had to be looked at more closely, and this involved a consideration of the means of achieving the cultural values that general education aims at. The result has been a general acceptance of the view that these values are not inherent in or the sole prerogative of certain studies or disciplines such as those of the traditional curriculum, but can be achieved in various ways. All over the world the practical problem of the schools is being seen as that of finding ways appropriate to their culture, their times, and their pupils.

This process of reconstruction appears to pass through the following stages. First, attention is turned from the traditional curriculum as such to a consideration of the kind of human being it is desired that education should develop. Secondly, the educational means of achieving such ends is considered, and this leads to the framing of new curricula. For example, one result of such thinking has been the growth of a belief that a large part of the values claimed for the traditional liberal education can be achieved through the use of modern rather than classical languages and literatures, and even vernacular languages where these are well developed and have a considerable literature. Furthermore, a consideration of the relationship between the work of the school and the influence of the home and the cultural environment of the pupils has led to a realization that in the first stages of democratization the secondary school needs to provide a broader experience for its pupils than it did when they came mainly from the higher sections of a society, and when the school could often leave to the home the cultivation of the fine arts, concentrating its attention rather upon the sustained education of the intellect. In the same way many aspects of behaviour—manners, social customs, and so on—could also be left to the home. However, the secondary school in a society that is becoming democratic but whose working people have not yet had the chance to raise their own cultural level to that of the most cultivated sections of their society, has the task of supplementing the home in a wide range of activities. During the second quarter of the present century significant developments in music and the arts were initiated in many school systems, more especially at the primary and junior secondary level, and in recent years there has been a trend towards developing such subjects to a higher level in the later stages of the secondary school course, sometimes as voluntary optional activities, sometimes as part of the common cultural programme.

A report published in 1959 by the Central Advisory Council for Education (England) on the educational needs of young people from 15 to 18 years of age, saw this point as still relevant in the educational problems of England.[1] It noted that the great majority of children whose full-time education extended beyond the age of 15 were the first generation in their particular families ever to attend a grammar school; and this fact alone had important implications for the proper approach to be adopted to the children and their parents, the subjects to be taught, and the methods of teaching that were most likely to be successful. This is a situation in which more and more countries will be finding themselves in the course of the next decade.

Under the influence of such conditions the basic compulsory curriculum of secondary schools all over the world has come to include the following subjects: the mother tongue and its literature, mathematics, some of the natural and physical sciences, history and geography, music, drawing and physical education. In different countries other compulsory subjects are also included in the common programme, for example a foreign language at the junior secondary stage, especially among the many Asian and African peoples whose mother tongue is still inadequate for the needs of modern science and technology, and also in those European countries which need a world-language to supplement their own. The general result of the process appears to be that a world-wide pattern of a 'modern humanities' curriculum is coming into being which is distinctively different from the ancient humanities course that was for so long the vehicle for the liberal education of European children.

There has been some resistance to this trend. The introduction of subjects like art, music, manual training and physical education into the curriculum of secondary schools is often opposed by the teachers of the traditional subjects. There is also resistance on the part of educated parents in whose minds the traditional curriculum is still associated with prestige and status. This can be seen very clearly in some of the Asian countries which were long under the control of European powers and whose people have often resisted the modernization of the traditional European curricula of their European-type secondary schools.

Moreover, simply to replace old studies by new ones does not solve the basic problem. The attempt to define the values to be achieved and then to find the most appropriate means of achieving them was inevitably influenced by the traditional academic outlook of the educators themselves, and the first attempts at devising new curricula were almost exclusively restricted to the consideration of the subjects to be included in the curriculum and the topics to be included in the prescriptions for the various subjects. This was easier to do than to consider methods of teaching these subjects and the fundamental problem of how organized subject-matter can be used to develop the minds of young people.

In the United States of America, the deficiencies in the usual approach to the teaching of secondary school subjects received early recognition. The 'life-adjustment' movement of the late 1940s and early 1950s was based upon the view that, while the secondary schools were providing fairly well for the 20 per cent of young people who were preparing to go to college and university and also for the 20 per cent who had decided upon specific vocations and were learning vocational skills, the majority of young people still uncommitted in respect of future education and vocation were getting too little value from the general aspects of their education and tended to leave as soon

1. Great Britain, Central Advisory Council for Education, *15 to 18* (The Crowther report). London, HMSO, 1959, 2 vols.

as they could, dissatisfied with their education and unprepared for entering the outside world. The annual report of the U.S. Office of Education for 1952 posed sharply the problem of a community that wanted to keep all its young people at full-time schools until the age of 17 or 18, but which had not found the appropriate methods of education. 'For these young Americans secondary education must have objectives designed to meet their particular needs. Young people vary greatly in their abilities and in their capacities to learn. All of them, however, are capable of development as valuable members of society. A narrow academic education, far from helping all youth to mature properly, often causes social maladjustment, thwarts the desire to learn, and creates attitudes of failure and resignation detrimental to youth and to society as a whole. The large number of youth who leave high school before graduation is an indication that for them we have failed to establish a suitable education.'

The Commission for Life Adjustment Education for Youth, in its report on *Vitalizing Secondary Education*,[1] gave careful consideration to the question of the educational means to be adopted to deal with the problem, and came to the conclusion that what was needed was not so much a new curriculum as a new point of view with respect to the organization of teaching material, methods of teaching, and the relationship between pupils and teachers. It is suggested that the direct experience and the problems of the pupils themselves, both in and out of school, should provide the introduction to and the principle of organization of the systematized subject-matter that has usually been regarded as the curriculum, and that has been so often worked through logically but with little regard to its relevance to the needs and interests of the pupils. It may be noted that this is an illustration of John Dewey's views on the real transmission of culture. Mere verbal memorizing of organized facts unrelated to the purposes of the learner is likely to be transitory in nature, having little educative influence.

The development of what is termed the 'core curriculum' is considered to be a promising advance.[2] The aim of the core curriculum is to provide a course of 'common learning', or a common body of educational experience organized around the personal and social problems of the pupils. From the systematized knowledge reposing in textbooks, reports, and other resources, the learner seeks what is relevant to the problem in hand and sifts and integrates it in his own mind in the process of trying to find a solution. The experience he gains in solving problems that have immediate meaning for him is expected to help him to learn ways of meeting his future problems. This approach is similar to the case-study method that has been used in many fields of university teaching in recent years. It may indicate a means by which the traditional secondary school courses for the most able intellects may achieve what they have always claimed as their goal—the training of the inquiring mind rather than the loading of the memory with inert facts—and it is being considered carefully in several countries which are grappling with the problem of providing a general secondary education for pupils of only average academic ability. It may also prove to be relevant to the question of 'overloading'.

Recognizing that the desire to start work in the adult world is one of the prime motives of the adolescent, many countries are making sustained efforts to provide real work experience for the pupils and to enrich the meaning and deepen educational content of such work experience by relating to it appropriate aspects of the school curriculum such as literature, the social studies, and science.

Radical changes in the organization of subject-matter have required changes also in the arrangement of school time-tables and the allocation of teachers. The customary division of the school day into periods of from 45 minutes to an hour, each with a specialized lesson given by a specialist teacher, is being modified in many countries. Longer blocks of time, up to half a day in length, for example, have been found better when analysis of a problem, searching for relevant data, note-taking, report-writing and consideration of results, take place as a continuous sequence of learning experience. Moreover, with the breaking down of barriers between subjects, teachers have had to go beyond their own fields of specialization, and it is becoming a frequent practice to have one teacher in charge of two or more subjects that are closely related in their relevance to important problems for study.

In the United States of America, in certain of the British Commonwealth countries, and in several others, the problem of finding the right approach to the common curriculum for pupils of average intellectual ability has to be worked out in the context of the comprehensive high school. It is a context that has its own difficulties, perhaps the chief of which has been the tendency inherited from the traditional secondary school to treat all children as if they were academically inclined and intellectually above average. On the other hand, the efforts now being made to find a proper approach to the common curriculum for average pupils may, within the context of the comprehensive school, have a considerable influence on curriculum construction for the children of higher ability as well. In other countries the problem is being faced in separate secondary schools provided for the average pupils who are not regarded as likely candidates for entrance to the universities and who, therefore, have not gained places in the selective academic secondary schools. The separate school has its own distinct advantages and disadvantages in this respect. In Great Britain, for example, it has generally been thought that the secondary modern school which came into being in 1944 would, by its very separateness, be able to make a distinctive contribution to the development of the curriculum for average pupils. As stated in *The New Secondary Education*, a booklet published by the Ministry of Education in 1947: 'The aim of the modern school is to provide a good all-round secondary education, not focused primarily on the traditional subjects of the school curriculum, but developing out of the interests of the children. Through its appeal to their interests it will stimulate their ability to learn and will teach them to pursue quality in thought, expression and craftsmanship. It will interpret the modern world to them and give them a preparation for life in the widest sense, including a full use of leisure. It will aim at getting the most out of every

pupil that he is capable of, at making him adaptable and at teaching him to do a job properly and thoroughly and not to be satisfied with bad workmanship, and to be exact in what he says and does. Freedom and flexibility are of its essence and are indeed its great opportunity.'

The work of the secondary modern schools in Britain is still in its formative stages, and a wide variety of approaches is to be found. To develop a suitable general curriculum for the average child is undeniably their central task, and in this their experience, like that of the United States' efforts to do the same thing, is of significance to all countries embarking upon an attempt to provide a good general education for all pupils. Many of the secondary modern schools, too, are successfully providing courses leading to the General Certificate of Education for those of their pupils who are relatively high in academic ability. This is a group which, by the hazards of the selective process and the unpredictable changes that can occur in the mental growth of children, comprises young people who appear to be just as capable of benefiting from a grammar school education as many of those who were selected instead.

It will be clear from the foregoing references to the attempts being made in some countries to provide a good general secondary education for all pupils that, although from the point of view of the subjects taught there is a large common element in all the different approaches to the problem, there is also a great diversity in respect to the actual content of the subjects provided, the way the curriculum is organized, and the methods of teaching and learning being used. These vary not only from country to country but also from one type of school to another, and from one classroom to another within the same school. In recent years the most significant variations in approach appear to be those that have arisen out of the consideration of the needs of the large majority of pupils for whom neither the academic curriculum that leads to the university nor the specific trade training that leads to industry seems to be suitable. This is the group of young people who will in all probability enter those sections of their country's economy that will be undergoing the most rapid and far-reaching changes with the development of modern technology, namely, the multifarious positions of minor administrative responsibility which grow in importance as the need for manual labour diminishes. The educational problem in such circumstances is that of combining breadth of understanding of the world with mental flexibility and resilience rather than that of developing more specific vocational skills during the period of formal schooling. It is in this context that the significance of the world-wide trend to emphasize the general aspects of secondary education can best be appreciated.

Relating education more closely to work

A further important enlargement of the conception of the common elements that should form part of the curriculum of all young people has received much emphasis in the Eastern European countries since 1958 with the reforms that have been designed to relate the schools more closely to daily life and to provide their pupils with a realistic introduction to productive work. One of the serious inadequacies of the traditional academic curriculum of the secondary school that has been recognized by many educationists throughout the present century has been its tendency to neglect the practical aptitudes of young people. While handicrafts of various kinds have formed part of the primary school curriculum of almost all countries over the past half-century, in most parts of the world the general secondary schools have made little provision for such activities.

In countries where the technical schools and trade schools were sharply differentiated from the academic secondary schools, the movement to give a good general education to all pupils brought about a better balance in the non-academic than in the academic schools, for the former were more easily able to add academic elements to their technical curricula than the latter could add technical elements to theirs. On the other hand, in countries where comprehensive secondary schools developed, it has been usual for the academically able pupils to have a curriculum so full of pre-university studies that there has seldom been time for manual subjects as well, except possibly some drawing and handicrafts in the junior secondary years.

Since the 1930s there has been an increasing tendency in many countries for some woodwork or metalwork to be introduced into the junior secondary curriculum for boys and for some appropriate practical work (e.g. dressmaking) to be included for girls; but except where such subjects formed part of specialized vocational courses provided for non-academic pupils their development tended to cease at a rudimentary level. The hindrances to the provision of a better balance between the verbal and the manual elements in development have been diverse and strong. The chief of these in countries of the European tradition has been simply the weight of the existing subjects, and the feeling on the part of teachers that to introduce new subjects would lead either to lower standards or to an overloading of the pupils. In these circumstances, where such subjects were not directly related to the university entrance examinations, they received very little encouragement from the teachers of the traditional disciplines. Furthermore, in all countries where school rolls have been increasing rapidly, the cost of making adequate provision of both buildings and equipment for good manual work has been a strong deterrent, especially in areas like some of the South American states which have long suffered from a serious shortage of proper school buildings and equipment even for traditional purposes. Added to these drawbacks, in some countries—several South and East Asian countries provide ready examples—there has been a strong prejudice against manual occupations among important sections of the community. In such cases, even when the secondary schools have tried to make a better provision for such subjects, either as part of the general education of all their pupils or as part of the more specialized vocational training of some of their pupils, they have seldom received support or encouragement from the community and have rarely felt that they had succeeded in their aims.

The efforts now being made in the Soviet Union and other Eastern European countries to provide polytechnical education at all levels and to initiate all senior pupils into the actual processes of production, form the most ambitious attempt that has ever been made on a national scale to integrate the verbal and the manual elements in the

personal development of all pupils and to relate closely the activities of the school with the activities of everyday life. In so far as the primary stage is concerned the change is not so great, for primary schools almost everywhere have been including art and handicrafts in their curriculum for many years. At the junior secondary stage, the change represents a generalizing, for all pupils, of opportunities for learning basic manual skills that are in most countries restricted either to the first year or two of the course or to the non-academic pupils. During both these stages the pupils' schooling is to be brought more closely into touch with outside work by means of community service such as the care of school buildings, public gardens, and so on.

At the senior secondary stage the most fundamental development is taking place, for here, instead of the academically inclined pupils giving up manual activities entirely, as occurs in most countries, they will be spending the equivalent of at least one day a week in actual production-training in factories and similar enterprises or on farms, under the supervision of the technical personnel of the enterprises themselves. At each stage, therefore, an integration is being sought between the development of manual abilities through educative activities and the participation in socially useful labour. The pupils will continue to develop their vocational skills throughout the whole course of their school lives, opportunities will be given them to make an increasingly valuable contribution to the economic life of their country while they are still at school, and it is intended that wages should be earned in accordance with the development of the pupils' productive efficiency. In such ways as these the transition from school to full-time work should be more smoothly effected.

It is instructive to examine the trend towards the development of a 'general and polytechnical education' more closely. The basic ideas are, first, that the divorce between the theoretical and practical aspects of life, and the division of educational systems in such a way that some young people are given a mainly general cultural education while others are given a mainly vocational training, are a result of the early division of societies into classes; secondly, that in a democratic society each citizen must be both well educated in general and well trained in a specific vocational skill; and thirdly, that the schools in a democratic society need to find an appropriate way of providing a curriculum that harmoniously blends both the cultural and vocational, and the theoretical and practical activities in their curriculum. The educational implications of such ideas for schools and school systems were being seriously explored in a general manner in the early years of the present century by Marxist thinkers such as Lenin and Lunacharsky on the one hand, and by non-Marxists such as Dewey on the other, and isolated attempts were made by individual educators in several countries to conduct schools upon such advanced principles. It was not until the founding of the Soviet State, however, that a wide-scale attempt was made to realize such ideas in practice through a public education system.

The junior secondary curriculum was conceived of as being an harmonious continuation of the activities of the primary grades of the unified labour school and, as part of the seven-year school, it was thought of as providing a general and polytechnical education for all rather than a narrowly academic course aimed at preparing a minority for pre-university studies at the senior secondary stage. The main emphasis in the curriculum was: to impart a definite body of theoretical knowledge derived from the fundamental academic disciplines of modern European civilization, to give an understanding of the nature of the Soviet State, and to give a practical introduction to the work of a socialist society. Within 10 years after the Revolution efforts were being intensified to link up schools with factories and farms and to develop pedagogical methods that would use the economic activity of an area as the school's practical laboratory.

During the next decade less emphasis was placed on general polytechnical education and, in an attempt to raise the level of scholarship, the schools reverted rather to the traditional European method of systematically organized subject-disciplines. As Mr. Khrushchev was to point out in 1958 in his memorandum on 'Strengthening the ties of the school with life, and further developing the system of public education', 'Our schools of secondary education suffer from the fact that we have taken over very much from the pre-revolutionary *gymnasiums* whose purpose it was to give their pupils a certain amount of abstract knowledge sufficient for university matriculation'. During the second world war the idea of polytechnical education was revived, and when the destruction caused by the war had been repaired the country was ready for a further advance in scientific and technological development and in education. The directives adopted in 1952 by the Nineteenth Congress of the Communist Party of the Soviet Union for the guidance of the 1951–55 development plan envisaged the transition from seven-year schooling to universal ten-year schooling, and it was clearly seen that a curriculum suitable for all young people needed to be more closely related to the main types of productive work than was the existing academic curriculum. The relevant section of the directives reads as follows: 'With the aim of further increasing the socialist educational effect of public schools and guaranteeing to students completing secondary school the conditions for a free choice of occupation, polytechnical instruction should be introduced in the secondary schools and measures necessary for shifting to general polytechnical education should be undertaken.'

This stimulated a great deal of discussion upon the meaning of polytechnical education and on the best means of developing an appropriate curriculum. All the Soviet Republics began to revise their syllabuses. The theoretical subjects were carefully pruned of outmoded material of little practical value, increases were made in the time allotted to laboratory work in the sciences, a course on the fundamentals of production, combining both theoretical study and practical activities, was devised, school agricultural plots were developed, workshops were provided for woodwork, metalwork, and similar fundamental crafts; and in the final two years of secondary education the studies of the school were supplemented by participation in the work of factories and farms.

But the simple juxtaposition of three or four hours per week of practical work alongside the theoretical studies which occupied the greater part of school time did not have the success desired. Young people in increasing numbers

were graduating from the 10-year schools with neither a taste for practical work nor an adequate knowledge of productive processes.

Under the direction of the Academy of Pedagogical Sciences of the R.S.F.S.R. a great deal of experimentation was carried out, in 50 experimental schools, with curricula and methods of school organization which would ensure that the senior secondary pupils would really learn a trade and become familiar with conditions in industry or agriculture before they graduated. In some urban experimental schools a weekly programme of three days' study and three days' work was developed, and in rural schools a seasonal distribution of study and work was tried. To ensure that standards of scholarship were not lowered and that pupils were not unduly overloaded, the length of study was extended to 11 or even 12 years. Such experimentation appears to have been regarded as successful, for some of the changes that have been introduced since 1958 appear to be along the lines of the work done in the experimental schools.

Mr. Khrushchev's criticism of the general secondary schools in the U.S.S.R. was very similar to criticisms that have been made in almost every country in the world when enrolments have increased to such an extent that the schools should no longer be attempting to prepare the majority of their pupils for entrance to the university. But traditions are tenacious. In his memorandum, already referred to, Mr. Khrushchev made the following trenchant criticism of secondary schooling: 'We still have a sharp distinction drawn between manual work and mental work, and there still remains a situation, inherited from the past, in which preference is given to a certain section of young people who, as it were, must without fail be enrolled in higher educational establishments and not go into factories or collective farms. As for the remainder, they have "not made the grade" and have "shown no abilities". And it is they who must go to work. This is fundamentally wrong and runs counter to our teaching and our aspirations.'

Proceeding to outline positive objectives, the memorandum continued: 'The schools must produce people with an all-round education, who know the fundamentals of science and are at the same time able to do systematic physical work; they must instil in the young people a desire to be useful to society, to take an active part in the production of the values society needs.' Then followed tentative suggestions of different ways in which these objectives could be realized.

In November 1958 appeared a joint statement by the Communist Party of the Soviet Union and the Council of Ministers of the U.S.S.R. which set out a detailed series of theses upon the strengthening of the ties of the school with life, and in December 1958 the Supreme Soviet enacted a new fundamental law on education which was based upon these theses. The reorganization, to take place by the 1964/65 school year, is as follows. The basic compulsory school is an eight-year 'general education, labour, and polytechnical school' for children between 7 and 15 years of age. Its work is divided into two cycles of four years, the latter being the first stage of secondary education. The extra year that has been added to the old seven-year school is intended to allow for the new polytechnical studies —school workshops, participation in productive work, field excursions, and so on—without unduly overloading the pupils.

After the completion of the eight-year course, a great diversity of educational provision is to occur. The November theses stated that 'the point of departure for the reorganization of the schools was the idea that all school children without exception should take part in socially useful labour at enterprises, collective farms, and other places of work. Difficult problems will have to be solved if numbers of young people between 15 and 18 years of age are to enter production and at the same time receive both specialized training and further general education, and the education law provided for several approaches to this task. Some young people will enter the specialized secondary educational establishments, the technicums, and will be prepared to fill intermediate positions in industry, commerce and agriculture, and in medical, educational, and cultural occupations. Others will continue for three years in the senior stage of the secondary schools proper, but the latter will be transformed into the 'secondary general education, labour, and polytechnical schools with production training'. These pupils will devote two-thirds of their time to general subjects and the rest to vocational training and productive work; leavers obtain a general school certificate and a trade qualification. These schools may be attached to the eight-year school, thus forming an eleven-year unit, or they may be separate. The greater proportion of the young people leaving the eight-year school, however, will enter full-time employment and, after a period of specific vocational training, they will have the opportunity of completing their general secondary education by means of evening classes, correspondence courses, or part-time day schools. It is intended to make provision for releasing serious students from their work for two or three days a week to help them pursue their studies.

It is too soon yet to see which of these various methods of attempting to integrate intellectual and practical activities into a better-balanced and more comprehensive general education is most effective, and which method of combining a general cultural education with specific vocational preparation brings the best results. It seems likely, however, that this experiment will, in one way or another, markedly influence the theory and practice of secondary education throughout the world.

THE DIFFERENTIATION OF THE CURRICULUM

One of the most difficult of the problems that are now being raised by the trend towards providing a good general secondary education for all, concerns the proper balance to be aimed at between the general and the specialized elements in each pupil's education. The main aspects of this problem are: what subjects should be regarded as constituting the specialized elements in the school's curriculum, at what stage of the pupil's educational development should such subjects be studied, and what is the relationship between the organization of school systems and the provision of a suitable curriculum.

Vocational differentiation

A factor that has alway had great influence in determining the nature of specialization at the secondary level has been

the relationship of schooling to vocation, and the actual subjects taught to young people, as well as the age at which they have been taught, have varied from society to society and from time to time in accordance with the economic and political situation of the countries concerned. The length of training required to produce effective workers in the different sections of a country's economy has influenced not only the time at which specialized training is given but also the length of general education that has been provided for young people entering different occupations.

In societies that are only at the early stages of industrialization the first aim of the school system is to provide the majority of children with a basic education in literacy, so that after they enter productive activity they will be better fitted to be taught improved techniques on the job. A minority will learn trades or will undergo specialized technical and commercial training in technical schools, trade schools, schools of commerce and so on, on completion of their primary schooling, and will enter middle-grade employment in their early teens. Another small group will continue with a general scholastic education leading to the university and to schools of higher technology; and, in effect, even this general scholastic education constitutes a vocational specialization in a society which cannot provide a long course of scholastic education for all young people. Whether the different types of specialized preparation are given in one school or whether, as is more usual, they are given in different kinds of school, the tendency during this phase of development is for the pupils to begin their specialized training immediately after their primary schooling. The majority of those who undertake some such form of post-primary training take only short courses, which tend to emphasize immediately useful knowledge and vocational skills. Further training for the specific work being undertaken is usually received on the job and also at part-time schools and classes out of working hours. This tendency to leave school at an early age after a short period of special post-primary training is still the general rule in the majority of underdeveloped areas.

In the more highly industrialized countries, on the other hand, the trend over the past 30 years has been towards delaying the age of entry of young people into employment so that they are better educated, more mature, more adaptable, and thus better fitted for the conditions of complex and rapidly changing technology. The development of specific vocational skills tends to be delayed more and more. For example, it is not uncommon now in the more advanced countries for young people to begin such subjects as book-keeping, shorthand and typewriting as late as 15 or 16, after completion of the period of junior secondary education, and to enter employment after only a year's special study, whereas earlier in the century they would have begun a two-year course at the age of 12 or 13 and would have entered employment with little general secondary education. Over the past few decades educationists in most countries have come to the opinion that several of the special vocational skills can be learned with greater economy of time and effort if their beginning is delayed until a later age than used to be customary, and the tendency is to do this and to devote most of the young person's secondary school course to general studies.

At the same time, as has been pointed out in the preceding section, the conception of general studies has become enlarged to include manual activities, art, and other subjects which once would have been regarded as vocational skills suitable only for those young people who were preparing to use them in their daily work. Generally speaking, educators now hold the view that the cultural or general educational value of a study depends upon the extent of its relation to other disciplines and aspects of life, because it is by virtue of this relation that a study can enlarge and illuminate the experience of the learner. With the trend towards a longer secondary education for all, educators have been striving in the early stages of schooling to approach the usual school disciplines less and less from the point of view of their value as specialized skills and more and more from the point of view of their general cultural value. This tendency has been at work in respect of all secondary school subjects over the past few decades, and it has greatly changed the nature of subjects like drawing and manual training that used to be conceived very narrowly.

The process of generalizing elements of education that were once regarded simply as vocational skills can be very clearly seen in the recent history of polytechnical education in the Soviet Union. The basic reason for the recent development of a 'polytechnical' curriculum is the effort to link the school with life. In effect an increasing number of students now attend school where, some years ago they would have been receiving specialized training in industrial enterprises. They now receive more general instruction in manual and mechanical activities in their school workshops where the emphasis is on the general principles of industrial production, the use and care of tools and machines of various types, and the development of a range of basic skills, rather than upon training related narrowly and directly to immediate production. At the senior stage, too, either in employment or in the secondary polytechnical school, a balance of theoretical and practical production training is designed to give the trainees a broad experience of the particular industry they are attached to and to develop in them a wide range of the basic skills required, rather than a too premature and narrow specialization in the interest of immediate productivity.

The same tendency can be seen in many other fields of vocational training besides those that lead to industry and commerce. For example, for the training of primary school teachers at the beginning of this century many countries had pedagogical institutes or middle schools which young people entered after completing their primary schooling, and these institutes combined general secondary studies with special pedagogical subjects. The general tendency over the past few decades has been to develop a common curriculum in the first cycle of all such special schools, and then to merge their junior sections with the lower general secondary schools or middle schools, as was done in Italy in 1940. Although in certain countries there are still teacher-training schools which take children from the end of the primary period, such institutions usually train teachers only for the nursery schools and the lower grades of the elementary schools.

Everywhere, then, the trend is towards the delaying of training in vocational skills until after the completion of

the junior period of secondary schooling at about the age of 15 or 16. At the same time there are considerable differences between countries in the extent and timing of the differentiation of courses in the junior secondary stage. Differentiation is common but it tends to be less and less based upon immediate vocational considerations.

Differentiation within general education

The general tendency over the past half-century has been for a steady but slow growth of differentiation to take place within the curriculum of the general secondary schools throughout the world. The earliest and most extreme case is that of the comprehensive high school. Although the high school in the United States was an institution much narrower in function than the academy which it superseded, it offered a greater variety of courses to its pupils than did any other secondary school. Its major function still was to prepare young people for college and university, but these institutions themselves presented a wide variety of courses and accepted entrants with a variety of qualifications, so their entrance requirements never had quite the same limiting effect upon the curricula of the high schools as was apparent in other countries. Such, indeed, was the variety of subjects and curricula offered, that one of the tasks of the Committee of Ten, appointed in 1892, was to consider 'the general subject of uniformity in school programmes and in requirements for admission to college'. The committee recommended that four basic curricula should be offered, namely (a) the classical, comprising Latin, Greek, German or French, English, mathematics, physical sciences, geography and history; (b) the Latin-scientific, which substituted additional sciences for Greek; (c) the modern languages course, which omitted both Latin and Greek but included two modern languages and the additional sciences of the Latin-scientific course; and finally, (d) the English course, which included one foreign language, either ancient or modern, together with the additional sciences. It did not seek to impose a uniform curriculum upon the schools, and indeed it recognized that such an attempt could not succeed, but it sought to bring about some uniformity in the basic requirements of what it considered to be a good general education. These basic requirements were a certain minimum length of time spent in the sequential study of those subjects which it considered to be of pre-eminent educational value. These were the subjects proposed for its four recommended courses. In addition, since the recommended courses did not occupy the full school week, time had been left for whatever additional subjects the different schools might offer and their pupils elect to study. Furthermore, the committee made no attempt to define the actual syllabuses of instruction in the different subjects, but was content to give a basic structure to their curriculum. Although it did not include commercial, industrial and trade subjects in its four basic college entrance curricula, it recognized that the needs of young people not intending to go on to college and university would also have to be cared for by the high schools, and it stated that if necessary it would be easy for schools to substitute such vocational subjects for some of the sciences taken in the third and fourth years of the 'English' type curriculum. The committee was still so far from thinking that any but intelligent pupils should enter the high schools that it declared that every subject taught in a secondary school should be taught in the same way and to the same extent to every pupil, no matter what the probable destination of the pupil might be or at what point his education might cease.

During the next two decades several other national committees considered the structure of the curriculum, and gradually the so-called 'unit system' was evolved whereby structural unity was given to all high school courses that aimed at satisfying college entrance requirements and yet great flexibility was retained in fitting courses to the needs of the individual pupils. A 'unit' was considered to represent a year's study in any subject in a secondary school, provided that it constituted approximately a quarter of a full year's work. It represented between three and four hours of work per week, continued throughout the school year. At the same time as the unit system was being adopted there was a gradual reaction against the limitation of courses suggested by the Committee of Ten and a gradual fusing of the concept of units of study with the idea of greater flexibility in the actual choice of subjects in the curriculum. The tendencies of the period were crystallized in the report of the Committee of Nine on the Articulation of High School and College, appointed in 1910. The committee recommended that college entrance should require fifteen units, three of which should be English, one social science, and one natural science. Furthermore, it considered that each pupil should complete one other 'major' subject of three units in addition to English, and a minor subject of two units. It suggested that of the total fifteen units not less than eleven should consist of English, a foreign language, mathematics, social science, and natural science; and the remaining four units should be used for additional academic work or any other kind of work that best suited the interests of the individual pupil. The recommendations of the Committee of Nine set the pattern for the high school curriculum that, with minor modifications, has been followed in practice ever since. The freedom allowed to the schools in providing subjects to fit local demands and individual needs has been fully used over the past four decades in an attempt to make the comprehensive high school a suitable institution to provide for the education of all young people up to the age of 17 or 18, no matter what their abilities and interests might be.

In practice, about half of a pupil's curriculum consists of required subjects that all pupils take, and the other half consists of electives that serve immediate interests or future vocational needs. Since the different local school systems are free to change their curricula at will, and since the pupils are free to choose their options, the curricula of the high schools are extremely sensitive to changing conceptions of educational needs. Change and revision are taking place all the time, and they are brought about not only by the deliberate planned action of educational policy makers but also by the year-to-year action of the pupils in the course of choosing their optional subjects.

In recent years there has been a tendency on the part of educationists to seek to diminish the scope of electives and to introduce a closer patterning of subjects and a renewed emphasis upon the more academic subjects. J. B. Conant's

proposals, in *The American High School Today*, to make education intellectually more demanding for the intellectually gifted children, envisage a greater concentration upon English, social studies, foreign languages, mathematics, and sciences, and less time for the variety of electives outside the purely academic field. In line with Conant, many other educators have been pointing out that with the development of other agencies of general education in the twentieth century, such as the radio, television, cinema, the press and the wide range of voluntary associations, the school is no longer called upon to bear the heavy responsibility for the provision of non-academic subjects that it did in the latter part of the nineteenth and the beginning of the twentieth centuries, and that it should now leave more to such agencies and concentrate its tasks upon the academic sphere. This point of view does not go unchallenged by those who hold fast to the desirability of making wide provision for the differences in ability and interests of the pupils, even among the intellectual minority, and at present there is a continuing and lively controversy upon the responsibility of the schools towards the academic and non-academic aspects of education. It is too soon yet to see what will be the practical upshot of the conflict of views.

The diversity of curriculum developed in the high schools of the United States was partly stimulated by the emergence of the high school as a comprehensive school. In few other countries of the world did similar conditions exist, and in none has precisely the same sort of curriculum development taken place. In the majority of countries a separation of pupils into different types of school still takes place, either between 11 and 13, as in the majority of systems that have continued the traditional European pattern of a six-year primary school followed by a diversity of post-primary schools, or about 14 or 15 in the countries that have adopted the pattern of a basic seven- or eight-year unified primary and junior secondary school, followed by differentiation at the senior stage. One of the effects of such differentiation appears to have been that the curricula within the different types of school have remained much less flexible and more firmly patterned than have similar curricula in the less specialized institution. The nine-year German secondary schools up to the 1930s provide an example of differentiation of types of school combined with inflexibility of curriculum within any one type. The demands for new courses of study to supplement those of the *Gymnasium* and *Realgymnasium* had led to the development of seven or eight different types of school, differing mainly in the pattern of the foreign language courses offered: the *Gymnasium* provided Latin, Greek, and a modern language, the *Realgymnasium* Latin and two modern languages, the *Oberrealschule* two modern languages, and so on. From the pupil's point of view a choice of schools was offered, but once the school was chosen the curriculum followed automatically with no alternatives or electives. In much the same way the various secondary schools of Italy also had their set curricula followed by all pupils alike. In France, where there was no such distinction as in Italy between the classical *liceo* and the scientific *liceo*, the *collèges* and *lycées* provided for some differentiation of courses from the first year onwards. In the first two years there were Latin and non-Latin branches; from the third year, Greek and non-Greek courses, and in later years there was further specialization in preparation for one or other of the different *baccalauréats*.

The basic difference between the European and the United States system of differentiation lies in the way in which a course of study is determined. The European pattern is essentially one in which courses are framed for different purposes by the educational authorities, usually by the Ministries of Education, and the schools have to provide such courses in the manner presented; the pupils and their parents may be able to exercise some choice, but the choice is between ready-made courses which the school itself has little power to modify. The United States pattern, however, is one in which each school system, and to some extent each school, is free to offer what it considers best; and each pupil can follow an individually designed course comprising common elements together with optional elective subjects grouped in the way that appears best suited to his needs. Orientation and counselling in the two systems differs greatly in consequence. In the former, it is usually a question of orienting a child towards the most suitable of existing courses; in the latter it is more often a question of devising a course uniquely suited to the abilities, aptitudes and interests of each pupil.

These differences in the nature of the general secondary school curriculum have had a considerable influence upon the form and functions of the curriculum at the junior secondary level. In the junior high school of the United States a variety of subjects and courses is made available in the first two years in order to help the pupil make a wise choice of the subjects he will study over the subsequent four years. In the first years of the junior secondary school in the European-type systems the emphasis tends to be placed upon providing a broad introduction to all the main academic disciplines, and the final choice of courses from a limited number of possibilities is determined by the relative success of the pupils in the comparable studies of the junior period.

In the majority of European countries, and in countries like those of Latin America which in the main derive their curricula from the European tradition, the major changes over the past three decades have been taking place in the later years of the secondary school course, in those years in which definite preparation is being made for the school-leaving certificate and for the university entrance qualification. Here the tendency has been towards a diversification in the kind of course that will qualify for the certificate awarded, and even in countries which, like many in Latin America, provide for very little differentiation during the earlier years of secondary schooling, the present tendency is to allow a considerable branching of courses in the last year or two.

In between the United States and the European methods of curriculum organization are countries which, like Great Britain, have long provided a substantial core of common studies for all secondary pupils but have also allowed considerable diversification beyond the common requirements. Consultative committees in New Zealand in 1944, in South Africa in 1949, in New South Wales in 1957, in Pakistan in 1959, and in several other countries during the past decade, have supported this conception, recommending that each pupil's course should be a blend of (a) a substantial common element, comprising the mother tongue

and its literature, social studies, mathematics, natural and physical sciences, music, fine arts, handicrafts and physical education, and (b) a group of optional subjects, chosen to suit the vocational aspirations or current interests of the pupils. A common trend is to be seen in all of these countries in the emphasis being placed upon the desirability of continuing the study of the main academic subjects for several years whether they are in the common core or in the list of options. One- and two-year courses such as used to be common in the United States are not regarded as adequate for subjects of substantial academic value, even though they may be suitable for subjects intended to attain limited short-range objectives.

Difficulties in curriculum differentiation

The main driving force behind the movement for differentiation of curriculum, as distinct from differentiation of actual schools, appears to have been the practical experience of the teachers, who have found that the traditional academic curriculum was not suited to the needs of children of only average ability. With the increase in the number of young people from the primary schools who continued into the secondary schools, came an increasing concern with the problem of pupils who could not learn as rapidly as their class-mates, who failed in the end-of-year examinations, who were being forced to repeat classes, who apparently found little of interest or value in their schooling, and who left the secondary school prematurely and discouraged.

In seeking a diversification of courses, suited to the varying interests and capacities of the pupils, the teachers themselves have usually been well ahead of their communities, which have tended to cling to the traditional elements of the secondary school curriculum. In countries as different in circumstances and background as Ethiopia, Ghana, India, Iran and New Zealand, to take a few examples only, resistance has often been felt when attempts have been made to direct pupils from the traditional academic courses into courses emphasizing agriculture, handicrafts, industrial arts, and other fields regarded as more useful to the pupils, in the light of their level of ability, and to the needs of their community.

There are several motives behind the tendency to resist differentiation, of which two in particular have frequently been reported by various countries. The first is related to the role traditionally played by secondary education as a means of selection and training of an elite that would enter those occupations of a community that have prestige and status. When the first phase of democratizing secondary education occurs, the most intelligent young pupils of the lower-status groups in a community are able to use the secondary schools as social and vocational ladders to rise out of their class. The secondary school course is seen to be a means of social mobility for the minority of lower-class pupils who are able to complete it. Such expectations of getting on persist long after the second phase of democratization is under way, though at this stage so many of the population are embarking upon a secondary education that few will in fact be able to effect an entry to the higher positions in the community. It is during this difficult phase in social development that the educators report the need for making differential provision for young people of diverse abilities for whom the traditional academic course does not appear to be suitable and for whom there will be no openings in the professions or the higher administrative positions to which, formerly, nearly all secondary school graduates proceeded. It is in this phase, too, that parents and pupils continue to choose the academic courses, hoping that they will be able to attain the *baccalauréat*, pass the matriculation examination, or gain whatever certificate is the sanction of a completed academic curriculum. It is at this point that the community begins to suffer from the problem of unemployed graduates who have expected better employment than in fact is available and who have not been suitably educated for the work their community can offer them.

The problem appears to diminish in importance as more and more people complete a secondary education, for by then it becomes clear to the community that the secondary schools are no longer narrow ladders for the advancement of a fortunate minority but are part of the broad and universal facilities providing the basic education needed by all citizens no matter what their abilities or what their position in society is likely to be. This phase has now substantially been reached in the United States, and it is being rapidly approached in certain of the British Commonwealth countries. It will be many years before most European countries have an adult population the majority of whom have attended a secondary school, and for vast areas of the world a much longer time will be needed. In the meantime many countries are likely to experience in the near future the same problems of differentiation either at the beginning of the junior secondary stage or when the senior stage begins.

During the transitional phase, the acceptability of differentiated courses and of secondary schooling itself by the pupils of average ability appears to be influenced considerably by the nature of the leaving certificates offered by the school system. When only certain academic courses in the school curriculum can lead to the graduation certificate, these courses exercise an attraction upon pupils for whom they are not really suitable. But when graduation requirements are based upon the satisfactory completion of whatever course a pupil follows, as is found in the United States, an attainable goal is presented to most pupils and they are free to think realistically about the most suitable course for them to follow. To a lesser degree the School Certificate examination of New Zealand, which can be sat for in a wide variety of subjects and which is usually taken when the pupil is about 16 years old, has also brought the different courses of New Zealand's comprehensive high schools nearer to parity of esteem; and in Great Britain, the possibility that the more intelligent pupils of the secondary modern schools will be able to prepare for the General Certificate of Education in some of their subjects has also reconciled many people to their children's inability to gain places in the selective grammar schools. In the Soviet Union, too, every effort is being made to ensure that the pupils who go into diversified schools at the senior secondary stage will be able to prepare for entrance to higher educational institutions. Such educational arrangements as these make it possible for different secondary school courses to be perceived by the

community as equal in value in the sense that each of them is suited to the needs of the pupils who are following it. This is a trend which appears, however, to be dependent ultimately upon a considerable measure of egalitarianism in the social or economic structure of a community; for if the degree of prestige of occupations and positions in society varies greatly, the educational courses leading to these different positions can hardly fail to share their prestige.

The second factor frequently reported as hindering the differentiation of courses is a purely educational one. It is the belief that the traditional academic curriculum is a superior means of education for all normal pupils than most of the new subjects that have found their way into the secondary schools in recent years. At the beginning of the present century the doctrine of transfer of training in its original simple form was still believed in, and the traditional subjects of the European grammar schools were regarded as possessing the inherent power of training the mind and disciplining the mental faculties. However, this is no longer the ground upon which claims for the value of these subjects are generally made. Rather what is emphasized today is their power to give meaning to human experience by passing on the cultural heritage of mankind. This belief in the humane value of the academic subjects is implicit in most current statements of the aims of secondary education, and with it goes the further belief that such values are important for all human beings, whatever their level of intellectual ability, and that all human being can derive benefit from the traditional subjects, at least to some extent.

Few teachers who hold this point of view would seem to believe that precisely the same learning material is equally suited to all pupils. What they do believe, however, is that within the major fields of human experience—literature, the fine arts, natural and physical science, mathematics, music, the social sciences, and so on—there is humanizing material for all people, though the actual content of the courses and the methods of teaching used should be varied by the teacher to suit the abilities, interests, and level of maturity of his particular pupils.

Both of these sources of resistance to differentiation have played an important part in the evolution of the secondary school curriculum, and both operate to some degree in all countries at the present time; and while the present practices in most countries allow for considerable diversification of courses throughout the whole period of secondary education, the tendency is towards emphasizing the common elements and delaying major subject differentiation until later and later in the child's school life.

School organization and the curriculum

The structure of school systems has a profound effect upon the organization of the curriculum. For example, if the nine-year course of the traditional German *Gymnasium* is compared with the four-year course of, say, a Canadian high school, it is not difficult to see how this difference in structure influences the content of the subjects taken, their progression, and the methods of teaching employed. Within the different countries, too, different branches of the educational system have different structures. The long-course *Gymnasium* and *lycée* have operated parallel to the short-course middle school and the even shorter continuation school, and as attempts have been made to co-ordinate the work of these branches, the differences that exist between their organization and structure have influenced the resulting arrangements.

The nature of the problems caused by the attempt to bring some unity into systems where early diversification took place can be illustrated by considering the influence of the short-course European middle school upon the curriculum of the long-course secondary school. While these two institutions were patronized by different classes in society and little attempt was made to see that the right pupils (as judged by scholastic ability) went to the right schools, the two institutions could develop their own appropriate curricula independently. The full secondary school planned a long, carefully graded sequence of studies leading to the university entrance qualification, while the middle school planned a shorter course with equal care that it could be adequately completed in the time available. With the growth of the democratic movement, provision had to be made for the transfer of pupils from the middle school if, on completing its studies, they were deemed to be of sufficient ability to justify their continuing at the full secondary school. In such cases transfer is seldom easy to effect in practice, mainly because the pupils have not been studying the same curriculum as that provided in the schools to which they should be transferred. Such differences, in fact, have been great enough to deter both pupils and educational authorities from making transfers, except in outstanding cases. In consequence of difficulties like these, attempts have been made to relate the curricula of the different types of school more closely together. This tendency, which can be seen in all European countries over the past three decades, becomes apparent at that point in the development of any educational system at which a serious attempt is made to allocate pupils to schools on the basis of their own ability and to reduce the influence of their parents' social position. It applies to some degree also to the allocation of pupils to different courses within the one type of school.

Attempts at co-ordination, however, cause serious problems in the organization of the curriculum of any one school, and over the years considerable friction has arisen between the different types of school, for in practice what is often required is the postponement in the full secondary school of some study such as Latin till after the period when any late-comers from other schools might want to enter and perhaps take the classical course. On the other hand, the short-course school will also be faced with difficulties if it attempts to make provision in its curriculum for subjects that can with difficulty be justified unless they are to be pursued for as long as they would be in a full secondary school.

In an attempt to remedy this situation educators in many parts of the world have tended, during the past 20 or 30 years, to try to reconstruct the secondary school curriculum in such a way that it forms two cycles. The first cycle is one in which the curriculum consists mainly of the common studies that all young people will be pursuing, no matter in what type of school they are to be found, while the second cycle is to provide for the

final differentiation of studies required in preparation for entrance to a specific vocation or to a higher vocational training institution. In general the tendency has been to consider that the first cycle should reach from the beginning of the secondary period till the time of the minimum school leaving age, for example, the Langevin Commission in France (1947) recommended a four-year *cycle d'orientation* followed by a three-year *cycle de détermination*. A two-cycle structure was also recommended by an Inter-American Seminar held in Chile in 1954–55, and many of the Latin American States have introduced this system, although the length of each cycle varies from country to country. The Eastern European States have been adopting a four-year period of junior secondary education, and so have several other countries, such as Egypt. In Great Britain, and in many countries whose educational systems have been influenced by British schools, the effective pattern is that of a five-year period leading up to the General Certificate of Education, followed by one or two years of pre-university preparation.

It should be noted that the structure of the curriculum does not necessarily correspond with the administrative division of the school system itself, even though it may be influenced by administrative arrangements. In most countries the two cycles of secondary education are given within the one school; in other cases the two curriculum cycles may be out of step with the administrative structure. For example, although the 3-3 system of separate junior high school and senior high school is common in the United States, there has been in recent years a tendency towards completing the orientation period in the first two years of the junior high school and regarding the third year as belonging to the senior high school period from the point of view of curriculum structure, thus in effect giving a four-year sequence of senior high school studies. Similarly in New Zealand, where there has been occurring a gradual reorganization over the past 40 years whereby the last two classes of the eight-year primary school have been converted into centralized intermediate schools, the current tendency in the intermediate schools themselves is to try to bridge the gap that separates them from the high schools by the formation of local committees of intermediate and secondary teachers to seek ways and means of bringing about a closer sequential connexion between the curricula of the two types of school.

In recent years a further tendency has become marked in many school systems, and it is one that is blurring the earlier distinction between the first and second cycles. This is the tendency to use only the first year or two of the first cycle for orientation purposes. In England, France, the United States, and many parts of Latin America and Asia, the first two years are tending to take on a quality of their own largely derived from the function of orientation which has become important in countries which provide for some differentiation during the first cycle of secondary education. The distinctive nature of the orientation period, however, is tending to cause a splitting up of the first cycle into two parts, the latter of which is becoming more closely related to the curriculum of the senior stage of the general secondary curriculum. At the same time few countries other than those of Eastern Europe have retained the whole of the long first cycle as a period of common undifferentiated education as it was envisaged, for example in the report of the Langevin Commission. In general the opinion of the specialist teachers in the secondary school has been that pupils who have an aptitude for their subjects should begin them as early as possible. The foreign languages, both ancient and modern, are disciplines in which this point of view has been very cogently expressed and in practice this has led to some differentiation between the more and the less academic children from the very beginning of their secondary schooling.

The beginning of a foreign language, is indeed, just one illustration of the general problem of planning a long course of study for a sequential discipline in a system that is aiming to provide secondary education for all young people. Teachers generally agree that the major subjects of an academic secondary school curriculum need to be pursued for many years if they are to be learned thoroughly enough to be of lasting value to the learner. It is by no means easy to reconcile this need with the need to provide a good general education for other pupils in a shorter time, which is what the secondary modern type of school attempts to do and what the modern courses of the general secondary school also attempt to do. There is a growing tendency now in many school systems to consider that the sharp distinction between the period of 'orientation' and the period of 'determination' that was made by some of the earlier reformers was somewhat unrealistic in so far as it implied that determination should not take place until the period of orientation was concluded. That would leave the commencement of some studies till later than their teachers think is wise. A solution that is being adopted more and more generally is that all the major groups of sequential disciplines should be attempted by all pupils in the earlier phase of their secondary schooling, and that determination should proceed at a later stage by the retention of strong subjects and the abandoning of weak subjects. While this may appear at first sight to be a negative method of orientation, it in fact implies that the best way for a pupil to discover an aptitude is to try himself out at the activity in question over a reasonably long period of time. It implies too, that realistic guidance needs to be closely related to the actual educational provision available in the subsequent period of schooling. Moreover, in this way no time is lost by those pupils who show that they are capable of profiting from a long course of study in any given subject.

A further modification to the two-cycle method of organizing the curriculum is being brought about by the realization that pupils show differences in the rate of learning, and that some can complete the work set out for a given cycle in much less time than is taken by the average pupils. In countries which leave teachers free to construct their own curricula and organize their own schools without much central control this has often led to the grouping of pupils into different classes, 'streams', or 'sets', in accordance with their general scholastic ability or with their aptitude for special subjects. Such differentiated classes then proceed at different rates. The fast-learning classes may even complete the syllabuses for the school leaving certificate a year or two earlier than the average and then proceed to advanced studies.

The general effect of all such modifications of the cyclic

organization of curricula seems to be that in fact the cyclic form of organization is gradually being superseded, and in its place a unified but progressively differentiating curriculum is being evolved. In those school systems which make a break between the primary and the secondary periods at the age of approximately 11 years, the six- or seven-year period of secondary education appears once more to be becoming unified as it was in the nineteenth century; but the new unification is broader and more flexibly organized to suit the wide range of pupils that the present-day secondary schools care for.

THE OVER-LOADED CURRICULUM

One of the most persistent problems that have been faced by secondary schools during the past 30 years is the problem of the overloading of the courses of study and the overburdening of the pupils. This problem has been most commonly found in the academic secondary school or in the more academic courses of the comprehensive schools, and it is closely related to problems of preparation for the examinations that permit entry to the universities and other selective institutions of advanced education. The essence of the complaints is that the pupils are burdened with too much intellectual work and that the strain of prolonged study, combined with anxiety lest they fail in their examinations, has a deleterious effect upon their physical and mental health. Furthermore, many teachers maintain that numbers of intelligent young people are being given a distaste for learning instead of a love for it, and that this leads to a waste of academic talent. The problem has become more apparent in recent years with the increase in the secondary school population, for what was once a situation affecting only a few thousand pupils is now the concern of hundreds of thousands, and by its sheer magnitude the problem has begun to attract widespread public attention.

It is far from being a recent problem, however. Indeed its appearance on the educational scene runs closely parallel with the introduction of the sciences and other modern studies into the secondary school curriculum during the latter part of the nineteenth century, and with the extension of secondary education to the more intelligent young people of the working classes. The effect of the first of these factors was to bring into the curriculum of the secondary schools not only additional subjects but also subjects in which the growth of knowledge was proceeding at such a rapid pace that their syllabuses tended to become heavily loaded. The effect of the second factor was to introduce elements of urgency, seriousness, competition, and pressure to achieve academic distinction and scholarships for higher education that were largely absent from the secondary schools when they were reserved for a well-to-do minority of the population.

Already in the decade after the first world war attempts were being made to understand and deal with the problem in countries whose secondary education systems were developing in the European tradition. On the one hand the growth of knowledge was reflected in an increase in the difficulty of the requirements for entry to the universities, which determined to a large extent the academic curricula of the secondary schools; on the other hand, in a reaction against this, attempts were being made to prune the syllabuses to their essentials, to adopt more 'active' methods of learning, to reduce the amount of bookish memorization that was common in the secondary schools, and to pay more attention to other aspects of the personality than intellect. In many countries during the 1920s and 1930s such attempts were being made. In Brazil, for example, curriculum reforms adopted in 1931 were introduced by the Minister of Education in the following words: 'Much of the plan assigns to secondary schools the task of building up a system of habits, attitudes, and behaviour instead of loading the mind with knowledge and information that is the finished product with which educational industry usually seeks to form the stock of its clients. The education of man will never be achieved through a system of passive receptivity by which the intelligence of youth becomes degraded in the secondary schools.' But to work out in practice the conception of education implied in such statements is far from easy, and it is seldom claimed that in this respect organized academic education in the secondary schools generally has undergone very profound changes in methods and spirit over the intervening years.

It is now generally recognized that attempts to deal effectively and realistically with overloading call for a thorough understanding of the nature of the problem on the part of administrators, clarity of aims in the devising of syllabuses and textbooks, and a better understanding by teachers of the relationship between educational methods and educational outcomes. Recent attempts to grapple with the problem have emphasized its complexity and the wide variety of causative factors at work, not all of them the same in different countries. In the first place, in some countries it is the sheer number of subjects taken each year of the secondary school course that sets the problem. In the United States high school, which is regarded as singularly free from overloading and indeed is sometimes criticized for the opposite fault, the number of substantial academic subjects carried by a pupil in the course of a year may be as few as four, while in the schools of most countries it will be more and in many countries double that number. In part, the reason for the larger number taken rests upon the belief that substantial academic subjects need to be studied continuously and progressively over a long period of years in order to obtain their full educative value. Hence, while the United States pupil may take a foreign language or mathematics for only two years in order to obtain the necessary minimum of units to satisfy college admission requirements, in other countries the pupil will usually continue such subjects throughout the period of secondary schooling and will probably sit for an external examination based upon the presumption of four or five years' sequential study. The cumulative nature of the study itself introduces, moreover, an element of strain that is not present in shorter courses.

In some countries a pressing need for foreign language study is the cause of much of the trouble. When the mother tongue of a people is not a language widely used throughout the world, it is regarded as essential that the academic pupils of the secondary schools learn at least one and often two modern foreign languages thoroughly, so that they can read, write and speak the foreign tongue. In many

parts of Asia and Africa the situation is even more difficult. The mother tongue may be a dialect used by a very small number of people in the country, in which case a regional language may also have to be learnt; the regional language in its turn may be one in which adequate textbooks on mathematics, the sciences and technologies are not available, and much of the content of the secondary school curriculum will thus have to be learned through the medium of English, French, or some other language that has a well-developed literature and an adequate supply of modern teaching materials.

Conditions like these raise problems for which no easy solution can be conceived that could be applied within the education system alone without calling for sociological changes as well. Many of the reasons for overburdening, however, fall strictly within the pedagogical field and the solution is within the means of educators. The first of these is the effect of the growth of knowledge, which has caused syllabuses to become broader and more heavily burdened with factual information. During the second world war a great deal of experience was gained of how the traditional school syllabuses in mathematics and the sciences could be reduced to essentials, and how, by the use of visual aids such as films, filmstrips, and working models, abstruse conceptions, processes, and relationships could be effectively demonstrated, with a consequent increase in understanding and economy of time in learning. The post-war revision of syllabuses and textbooks in many countries has been influenced by such findings. In mathematics, for example, formal theorem learning in geometry has been reduced in amount, and mathematical notions once dealt with geometrically are now often treated more simply by means of algebra. Logarithms are used from an early stage to reduce the work of computing that used to be carried to unnecessary lengths in the past for the sake of the mental training it was deemed to give. There has, indeed, been a marked swing away from syllabuses that were based upon the 'disciplinary' value of a subject to syllabuses designed for practical utilitarian ends. In the Soviet Union, for example, the curriculum in mathematics and the sciences is constantly scrutinized to ensure that only essentials are taught. More progress appears to have been made in the schools generally in the revision of syllabuses than in the improvement of methods of teaching. Criticism in many countries indicates that the provision of adequate facilities for practical work in science and mathematics has not kept pace with the needs of the schools, and that even where cheap and readily improvised models and apparatus would be satisfactory, teachers still rely too much on verbal and bookish methods.

Two other major changes have also been suggested in recent studies of the overburdening of syllabuses: the first is the grouping of related disciplines, and the second is the adoption of the 'centre of interest' method of learning. These two approaches are in some respects closely related, though the emphasis in the former is upon the subject-matter itself and its organization, while the emphasis in the latter is upon the interests and learning methods of the pupils.

Examples of the grouping of subjects are to be found in the natural and physical sciences and in the social studies. The conception underlying the idea of teaching 'general science' rather than the separate sciences of chemistry, physics, zoology, botany, etc., is that the pupils' understanding of the methods of scientific thought and experiment should begin with the investigation of some of the phenomena of everyday life, and that only at a later stage should a partition of the universe into the fields of the separate scientific disciplines be made. In this way the relevance of scientific methods to the problems and purposes of scientific investigation would be more readily apparent to the learner, and the body of factual information acquired would be integrated into larger and more meaningful areas of knowledge and would thereby be more easily assimilated. In a similar way the organization of subjects like history, geography, civics, politics into the study of a complete human civilization would bring a unity and meaning to their learning that young people do not readily find when the separate subjects are narrowly conceived. In Great Britain and the United States, and in several of the countries whose education is susceptible to their influence, many attempts have been made in the past 15 to 20 years to remodel syllabuses along such lines as these. Considerable success has been reported by teachers whose children are following the less academic courses. The courses of the highly intelligent children, however, appear to have been so much influenced by the fragmenting tendency of subject-organized external examinations that in practice their curricula in general science and social studies have often been simply the study of the usual separate subjects with merely a change of name in the school time-table. In many countries it is agreed that a more understanding approach to the problem is dependent upon the production of better textbooks and reference materials and upon the better training of teachers.

Better materials and better teachers are also indispensable in any attempt to organize a curriculum around the interests and problems of the pupils, for the teacher needs breadth of knowledge and an understanding of the relationship between different subjects in order that he may be able to guide his pupils well beyond the first stages of curiosity-satisfying investigation and far enough into the problems being studied for them to appreciate the ultimate need for systematic scholarship. Again, because of the difficulties involved in any sustained attempt to apply such methods of curriculum organization, more general success has so far been achieved with classes of children of average or lower ability than with the scholastically able. So far, no country would consider that it was using such methods successfully to solve the problem of academic overloading.

In most countries where the problem has assumed serious dimensions the general view among educators is that one of the main causes is the domination of the secondary school curriculum by external examinations and the prescriptions of work laid down for them. Prescriptions are never more than outlines of the subject-field to be covered; and in the attempt to see that no corner is left untouched so that every possible examination question is prepared for, the teachers are often forced to an accumulation of detail that they realize to be pedagogically unsound but that seems unavoidable. Over the past 30 years, persistent criticism has been directed at the effects of external examinations upon secondary school syllabuses, teaching

methods, and pupils, and some countries have ceased to use them as a means of evaluating the work of their pupils either for the award of leaving certificates or for the granting of university entrance qualifications. However, even an internal examination or assessment of the work of pupils by their own teachers does not eliminate the pressure and strain on the pupils that occur when they are working to gain entrance to some higher institution, knowing that only a certain number of places will be available for a large number of candidates. This is the fundamental situation for young people following academic secondary school courses in almost all countries of the world today, and in these circumstances the pressure for better achievement that is felt by the large proportion of pupils who know themselves to be 'borderline' candidates is not likely to be eased by changes in methods of selection alone. The causes of competitive overloading lie so deep that some educational sociologists have suggested they will be removed only by social changes such as the growth of a more egalitarian social structure and a consequent extension of provision for higher education.

CONCLUSION

The foregoing outline of some of the main directions of change in the curriculum of the secondary schools during the past 40 or 50 years is necessarily incomplete, and being highly generalized it does scant justice to the complexity of the educational scene. Its purpose, and indeed the purpose of this whole study, is to seek for underlying trends that give meaning to the host of discrete facts that a world survey of education made at any one point in time presents us with. However, the outline that has been sketched will have made it clear that there has never before been a period of history when such momentous educational changes were taking place throughout the world in such a short space of time. Either directly or indirectly the continuing curriculum changes are an expression of two characteristic tendencies of the age: first, the desire on the part of communities to fulfil through their schools the promise of modern scientific and technological achievement to lay the material foundations of better living conditions for all; secondly, the will to develop a democratic human society dedicated to the fullest possible development of every individual.

These two tendencies have acted and reacted one upon the other. The advances of science have required the growth of new elites, a wider and more democratic basis of recruitment to their ranks, and new educational programmes suited to the modern world. The expanding democratic provision of secondary education in its turn has brought a new realization of the educability of children of all classes of the community and has led to a broader conception of the educational needs of all young people. More democratic principles of differentiation have come into being. Instead of the children of different social classes being provided with different curricula from an early age—humane, general education for the higher groups, specific vocational training for the lower groups—the newer aims have been to provide both a humane general education and a specialized vocational training for all, according to their natural endowments and personal interests. The cardinal problem in the construction of secondary school curricula today is how best to ensure these two things: first, that every young person will be well developed in the common learnings that everyone needs in a democratic society; and second, that at the same time every young person is helped to achieve his fullest development in those things that he is naturally best at.

Seen from the most general point of view the major curriculum movement of the present age is towards a synthesis of this kind; but some countries are much further along the way than others, and at each stage of development the elements of the curriculum are different and reach a different balance. What is suitable at one time and place may not be right at another. For an appreciation of the present state of the curriculum in any country it is necessary to remember this fact, just as for an understanding of a country's difficulties and efforts at improvement it is helpful to perceive the general direction of change throughout the world. The particular gives content to the general, and the general enriches the meaning of the particular. An understanding of each is needed by those charged with the task of directing educational change.

CHAPTER VIII

SECONDARY EDUCATION PERIODICALS

The following is a comprehensive list of secondary education periodicals drawn up from information available at the Secretariat of Unesco. It includes periodicals devoted to secondary education in general, periodicals concerning vocational and technical education at the secondary level, and periodicals devoted to the teaching of special subjects at the secondary level. The latter may overlap with the primary or higher education levels. For a few countries which have no periodicals falling within these three categories, journals which frequently publish articles on education at the secondary level have been given. The language of the periodicals is the national language of the country, unless indicated otherwise. The information given is as follows:

Title.
Publisher and address or address for subscriptions if different from publisher.
Number of issues per year.
Date founded.

INTERNATIONAL

Boletín iberoamericano de cultura técnica. Oficina de Educación Iberoamericana, Instituto Iberoamericano de Investigaciones y Enseñanzas Técnicas, Departamento de Información y Publicaciones, Avenida de los Reyes Católicos, Ciudad Universitaria, Madrid, Spain. 1. 1957.

Contact. International Federation of Foreign Language Teachers/Fédération internationale des professeurs de langues vivantes. Editions J. M. Meulenhoff, Amsterdam, Netherlands. Irregular. 1957. In English and French.

Education through art. International Society of Education through Art/Société internationale d'éducation artistique/Internationaler Verein für Erziehung durch Kunst, Kanaalweg 64, Scheveningen, Netherlands. 2. 1958. Articles in English, French or German.

FIEP bulletin. Fédération internationale d'éducation physique. Mme Ann-Mari Ivarsson, Sandgatan 14, Lund, Sweden. 2. 1930. In French.

International bulletin of secondary education/Bulletin international de l'enseignement secondaire officiel. International Federation of Secondary Teachers/Fédération internationale des professeurs de l'enseignement secondaire officiel. Secretary General/Secrétaire général: Mr. A. W. S. Hutchings, 29 Gordon Square, London, W.C.1. 2. 1921. In English and French.

International journal of health education. Revue internationale d'éducation de la santé. International Union for Health Education of the Public/Union internationale pour l'éducation sanitaire de la population, 3 rue Viollier, Genève, Switzerland. 4. 1958. Separate editions in English and French.

International review for business education/Revista internacional para la enseñanza comercial/Revue internationale pour l'enseignement commercial/Rivista internazionale per la cultura comerciale/Internationale Zeitschrift für kaufmännisches Bildungswesen. S. Schaffner, 59 Kirchlistrasse, St. Gall, Switzerland. 2. 1926. In English, French, German, Italian and Spanish.

Nordisk matematisk tidskrift. Matematisk Institutt, Blindern, Oslo, Norway. 4. 1953. In Danish, Norwegian and Swedish. Published by 10 different mathematical associations in Denmark, Finland, Iceland, Norway and Sweden.

ARGENTINA

Cátedra y vida. En torno a los problemas de la enseñanza media. Diaz Vélez 4038, 1º B, Buenos Aires. 12. 1956.

AUSTRALIA

The Australian mathematics teacher. The Mathematical Association, New South Wales Branch, c/o Sydney Teachers' College, University Grounds, Newton, N.S.W. 3. 1945.

Australian science teachers' journal. Australian Science Teachers' Association, c/o Sydney Teachers' College, University Grounds, Newton, N.S.W. 3. 1955.

Babel. Journal of the Modern Language Teachers' Associations of Victoria, South Australia and Western Australia. University of Melbourne, New Arts Building, Carlton N.3, Victoria. 3. 1956.

Esprit and Geist. Department of Education, Sydney, N.S.W. 1958.

Physical education journal. Australian Physical Education Association, c/o Physical Education Department, University of Melbourne, Carlton N.3, Victoria. 4.

AUSTRIA

Der Mittelschullehrer. Verband der österreichischen Mittelschullehrer, Schottenbastei 7, Wien I. 12. 1954.

Der Mittelschullehrer und die Mittelschule. Sektion Mittelschul-

lehrer in der Gewerkschaft der öffentlich Bediensteten, Lackierergasse 7, Wien IX. 12. 1952.

Naturwissenschaft und Unterricht. Offizielles Organ des Vereines zur Förderung des physikalischen und chemischen Unterrichtes. Hippolyt Verlag Gesellschaft, Beatrixgasse 32, Wien III. 12.

Weg in die Wirtschaft. Gewerkschaft der öffentlich Bediensteten, Bundessektion 14, und Verband der Lehrerschaft an berufsbildenden Lehranstalten, Währingerstrasse 59, Wien IX. 10.

Zentralblatt der technischen und gewerblichen Lehranstalten sowie der Lehranstalten für hauswirtschaftliche, gewerbliche und soziale Frauenberufe. Bundesministerium für Unterricht, Generaldirektion für das berufsbildende Schulwesen, Abteilung 17, Minoritenplatz 4, Wien I. 6. 1949.

BELGIUM

THE EDUCATIONAL SYSTEM

Islam is the official religion of Afghanistan, and the Islamic faith makes it incumbent upon all men and women to receive education. Thus Article XX of the Afghan Constitution provides for free and compulsory primary education for every boy and girl in the country, without racial or other discrimination. Similarly, Article XXII of the Constitution lays down that all educational institutions shall be administered and controlled by the State. All schools, whether primary, secondary, vocational or at university level, are therefore under the direct supervision of the Government and their expenses are paid out of the state budget.

The structure of the Afghan school system is shown in the diagram on page 163. Secondary education begins after the end of the primary course and covers a period of 3 to 6 years, depending upon the type of school. Vocational and non-vocational secondary schools which give 3-year post-primary courses are called 'middle schools'. The *lycees* and the '12-grade vocational schools' offer 6-year courses (grades 7 to 12) in such subjects as technology, religion, agriculture or general academic subjects leading to the baccalaureate.

THE DEVELOPMENT OF SECONDARY EDUCATION

A modern school system was introduced into Afghanistan at the beginning of the twentieth century. The administration of that time, realizing the importance of modern education for the solution of contemporary problems, successively established primary, middle and secondary schools, and also a primary teacher training school at lower secondary (middle school) level. However, since the number of Afghan teachers was insufficient, teachers and advisers were also recruited from India and Turkey; modern subjects were taught by foreign teachers, and other subjects by Afghan teachers.

Since the majority of the teachers were of Indian extraction, the schools were run on the pattern of Islamic schools in India. English was the principal foreign language and during a short period Turkish and Urdu were also taught. Secondary education was divided into two stages. After passing out of the primary school, which then had 5 classes or grades, the students enrolled in the first middle grade. The middle school term lasted 3 years and the second stage another 3. The first 2 years of the second stage were the equivalent of the intermediate standard in India, and the last or preparatory year was intended to prepare students for various vocations.

In 1919 Afghanistan attained her independence and with it a new era of education began. The establishment of diplomatic relations with foreign countries was followed in some cases by bilateral cultural agreements. A team of French teachers was recruited in France and the Esteklal Lycée was established on the pattern of a French *lycée*. Similarly a school was established on the German pattern and a team of German teachers was engaged. The establishment of these two *lycées* gave great impetus to the introduction of modern principles of education and proved useful for the later establishment of secondary schools on the same models.

Side by side with academic secondary schools, vocational schools at the lower secondary level were also established; these included such training schools as the School of Administrators, the School of Office Management, the School of Agriculture, etc. The School of Arts and Crafts was set up as a secondary vocational school with departments of bricklaying, painting and drawing, carpet weaving and other trades. The vocational schools gradually rose to full secondary status and came to be recognized as *lycées*. The course at the teacher training schools was also extended to the level of grade 12. The Faculties of Science and Letters, which were at first rather like teacher training high schools, became institutions of higher education and began to train secondary school teachers. In 1942 general reforms were instituted in secondary schools. In the light of past experience the Ministry of Education drew up a co-ordinated teaching programme and produced manuals on teaching and examinations for all secondary schools.

Secondary education, whether general or vocational, is not compulsory, but it is completely free and students are even supplied study materials free of cost. Admission to secondary schools is conditional upon graduation from the primary stage with above average marks. Students are accepted in secondary schools at the age of 13. In order to help capable students in places where secondary school education is not available, the Government has established a generous system of scholarships which enable such students to continue their studies, free board and lodging being provided them by the State; the scholarships are renewable each year provided that the beneficiaries pass their examinations. Since all schools are run by the Ministry of Education, all units of the programme are prepared in accordance with government rules and regulations. The budget and programme of the Ministry of Education are approved by the National Assembly every year.

Administration

Secondary schools are divided into distinct categories, vocational and non-vocational, and come respectively under the Department of Vocational Education and the Department of Secondary Education. The main duties of these Departments are the framing of general policies regarding the schools they control, preparation of curricula and timetables, selection and supervision of reading material, execution of programmes, supervision of examinations and awarding certificates.

Proposals made by the Departments which do not involve radical or far-reaching changes in the system of education are approved by the Council of the Ministry of Education. The Ministry Council meets once a week and is composed of the Departmental Heads of the Ministry up to the rank of Director-General; the Minister acts as chairman and all orders passed by the Council must bear his signature. But proposed changes of far-reaching importance for the system of education, teaching programmes and policies, must go, for a final decision, before the most important educational body, the High Council of Education, whose decision is legally binding throughout the country. The High Council is composed of a number of high-ranking officials of the Ministry of Education as permanent members, and certain highly qualified scholars and educationists of long association with educational matters in the country. The latter are elected to the Council for a period of 3 years. The Council meets only when convened to consider a particular educational problem.

The Textbook Department of the Ministry is the sole body entrusted with the task of preparing and procuring school textbooks and arranging for their publication. Textbooks are written and compiled by specialists with the assistance of capable teachers fully conversant with the capacities and needs of students. Each book is submitted to a panel of teachers and experts for an opinion as to its conformity with the teaching programme and its suitability for the students of the standard for which it is intended. A substantial amount of money is earmarked for this purpose in the general budget of the Ministry of Education and textbooks are placed at the disposal of all schoolchildren in Afghanistan, each year, in both primary and secondary schools.

Each vocational or general secondary school is headed by a director or an acting director who is responsible for the conduct of all administrative and professional matters, e.g., supervision of teachers, implementation of the teaching programmes, supervision of the administrative staff, control of students' activities within the school, and control of expenditures and the school budget as far as lies within his jurisdiction.

To help him perform these duties he has one or more headmasters under him, according to the number of students in the school. Thus in a large school providing education at different levels the students at each particular level are supervised by one headmaster who is responsible to the director of the school, who is in turn responsible to the various departments of the Ministry of Education.

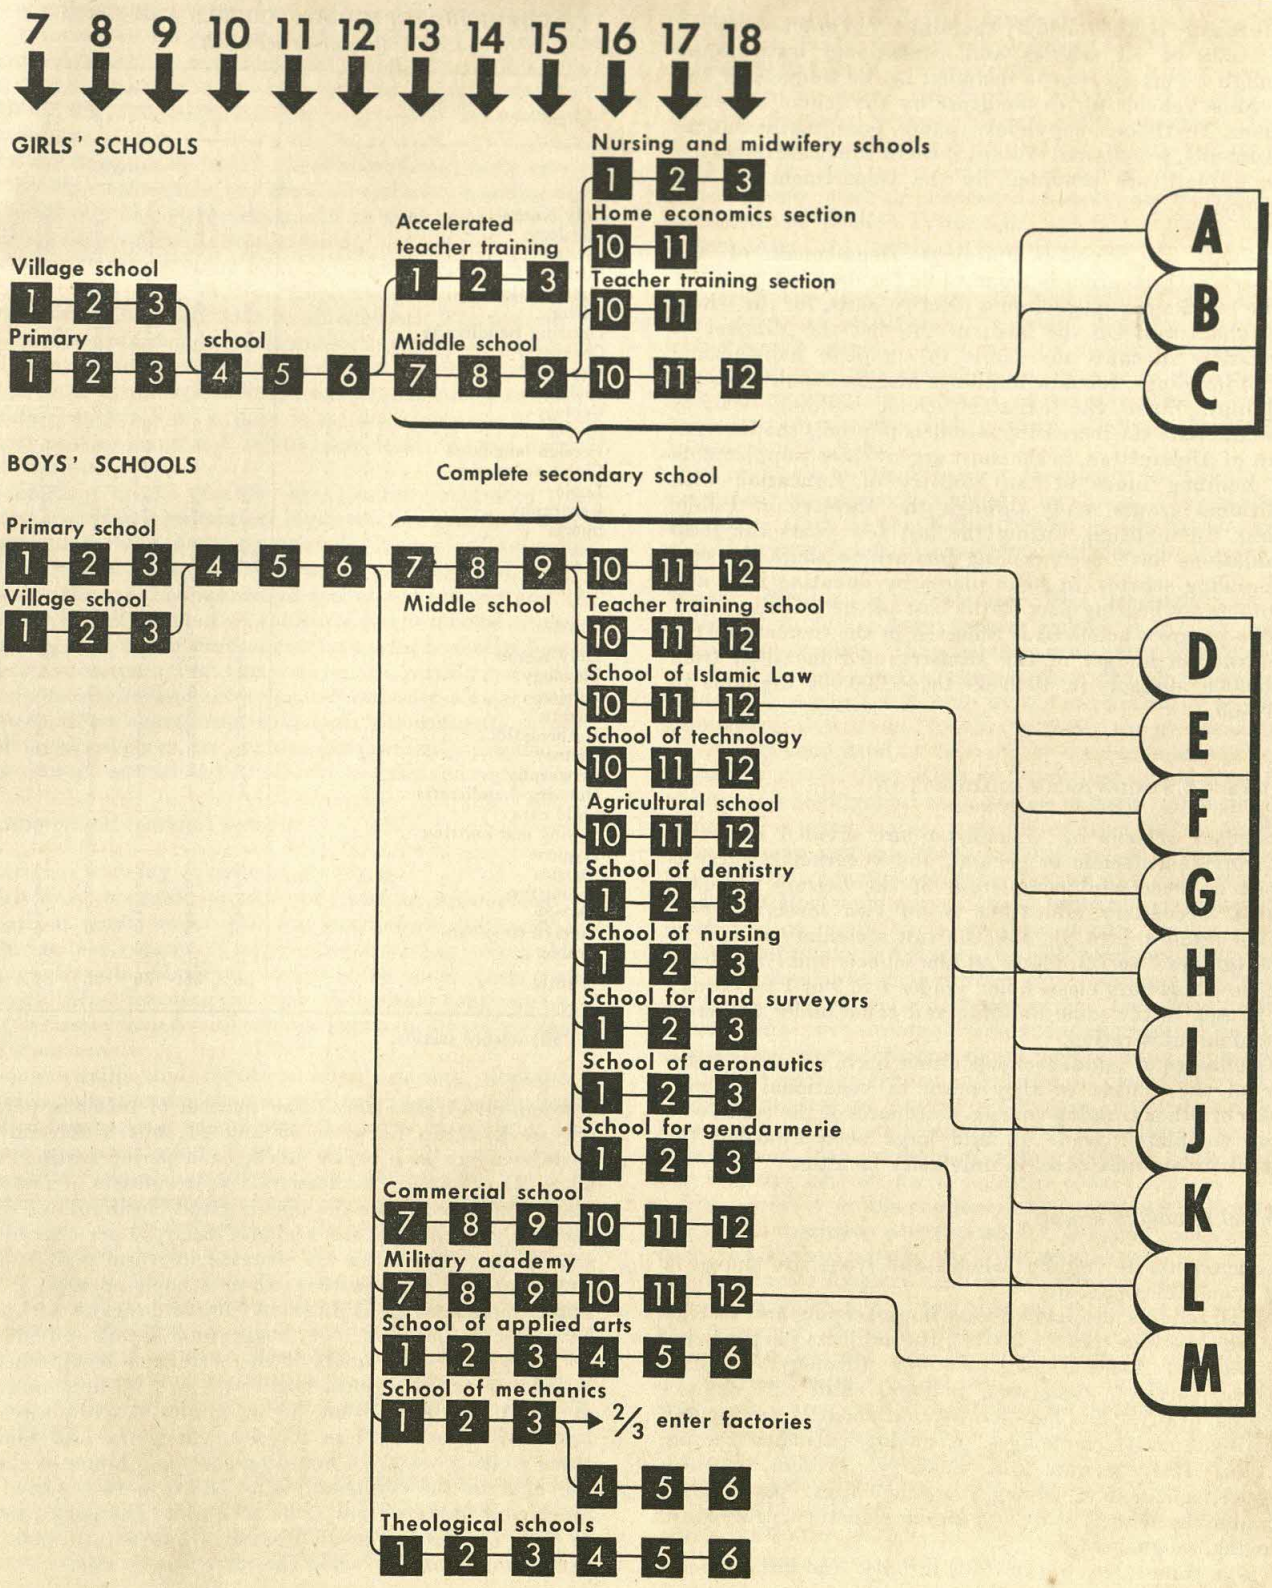
The duties of school principals in the provinces differ little from those of directors in the capital, except that they approach the Central Departments of the Ministry through the Provincial Directorates of Education which are their immediate superiors. The Directorates have been given the necessary powers to deal with most of the administrative and instructional problems arising in the schools under their jurisdiction and such problems as lie beyond their prerogatives and powers are submitted to the appropriate Department of the Ministry of Education.

Proposals made by any school administration for improvements in school administration and instruction are forwarded to the appropriate Department of Education after being passed by the council of teachers of the school. If the matter is beyond the power of the Department of Education to settle, it is placed before the Council of the Ministry of Education.

Supervision and inspection. This is carried out by inspectors attached to the Department of Inspection and also by members of the Departments of Secondary and Vocational Education. Both inspectors and the other officials who visit schools are selected from among the most capable teachers or experienced administrative officials and undergo special courses of training. Some school inspectors work under the direct supervision of the Central Inspection Department, others work at the central headquarters and also in the provinces under the supervision of the Provincial Directorates of Education.

The Ministry occasionally delegates central school inspectors to visit the provinces and report their findings to the Council of Education or the Educational Board.

Finance. All schools are fully supported by the Government and no financial assistance is received from individuals, parents, religious organizations, or other bodies. At the beginning of the fiscal year each school is informed of the budget allocated to it for the year. The directors are empowered to disburse money for salaries of teachers and administrative staff, stipends paid to boarding students, and certain other expenditures. There are however certain items which, though included in the school budget, cannot be dealt with without previous sanction from the higher authorities, thus the main budget for teaching materials



GLOSSARY

NOTE. In the accompanying diagram the schools at secondary level whose courses begin with the numbers 7 or 10, follow on directly from the 6-year primary school or the 9-year primary plus middle school course respectively; those whose courses begin with the number 1 may be entered by older pupils with the appropriate educational qualification. The diagram does not show a number of specialized middle schools, including the correspondence school.

teacher training school (boys): in the final year there are separate sections for intending primary and middle school teachers.

and furniture is controlled by the Ministry in order to supply the needs of all schools and educational institutions, although a certain sum is included in the budgets of the individual schools for expenditure by the school administrations. Textbooks, copybooks, paper, pens, mathematical instruments, pencils and erasers, most of which are imported from abroad, are provided by the Departments of the Ministry.

Buildings. The School Buildings Department of the Ministry of Education is responsible for drawing up a list of the buildings required, on a priority basis, for the whole of Afghanistan. On the basis of this list the Minister of Education allocates the funds to complete half-finished school buildings, for new buildings and for repairs to such buildings. Since the existing school buildings cannot accommodate the increasing numbers of pupils the Government of Afghanistan, in the most urgent cases, supplements the building funds of the Ministry of Education with additional grants made through the Ministry of Public Works. In addition, during the last few years the local populations have been coming forward to share the cost of building schools, in some places by donating land and in others by bearing part of the cost of the building.

The progress achieved is reflected in the increase in the construction budget of the Ministry of Education, from 4,200,000 afghanis in 1948–49 to 44,000,000 afghanis in 1959–60.

TYPES OF SECONDARY EDUCATION

Secondary schools in Afghanistan are divided into two categories—academic or general, and vocational; entry is based on successful completion of the 6-grade primary school. Secondary education is on two levels: middle school (grades 7 to 9), and the full secondary school or *lycée* (grades 7 to 12). Many middle schools and *lycées* have their own primary classes, i.e., grades 1 to 9 or 1 to 12 may be housed in the same building and come under the same school administration.

Graduates of middle schools either leave school to enter one of the trades, or they enrol in vocational schools, *lycées* or other training courses. Graduates of the *lycées* who have completed grade 12 and have been awarded the baccalaureate may enrol in university faculties.

General secondary schools

The curricula in middle schools and *lycées* are shown in the time-tables opposite.

Girls' schools also have 2-year housekeeping and teacher training sections (grades 10–11), the subjects taught being as follows: housekeeping section: theology, Persian, Pushtu, physics, chemistry, biology, child care, housekeeping, drawing and handicrafts, mathematics, sewing and knitting, cooking, languages, psychology; teacher training section: Holy Koran and theology, Persian, Pushtu, physics, chemistry, biology, mathematics, psychology, teaching methods, sewing and knitting, history, geography, drawing, languages.

These time-tables are in force in boys' and girls' schools throughout Afghanistan. The number of teaching periods per week varies between 35 and 41, but is normally 6 periods a day in a 6-day week, each period lasting from 40 to 50 minutes. The academic year consists of approximately 35 weeks, but the opening and closing dates differ according to the climatic region. Nearly 50 per cent of the schools in Afghanistan are situated in warm regions with comparatively mild winters; these schools open on 7 September and close on 21 June. In very cold regions with mild summers the academic year begins on 5 March and ends on 7 December. Day schools at the secondary level, whether in cold or warm regions, begin at 8 or 8.30 a.m. and end at 1.30 p.m.; in addition, higher grades attend classes for practical experiments in physics, chemistry and biology three times a week. In boarding schools 5 hours of classes are held in the forenoon, followed by a rest period for lunch and prayers from 12.30 to 2 p.m. The pupils return to their studies for an additional 1½ hours until 3.30 p.m. except on Thursday when the afternoon is free.

1. Philo-science section.

For enrolment in secondary schools (grade 7) candidates must obtain 60 per cent in the final primary examination (grade 6). In the case of boarding secondary schools where the number of applicants is large and accommodation is limited, the successful entrant must pass an additional entrance test.

In addition to the daily observations and tests carried out by the teachers in the class, 'quarterly' examinations are held and the students' marks in each subject are reported to the school administration.

The quarterly and half-yearly examinations are either written or oral; the third or final examinations consist of both written and oral tests in all subjects. The average of the marks obtained in each subject in the first two examinations are added to the average of the marks obtained in the final examinations and are then divided by two. The standard required as a pass is (a) an aggregate mark of 50 per cent or over, and (b) not less than 33⅓ per cent in each subject.

Secondary school teachers are generally recruited from among university graduates. However, for grades 7, 8 and 9 applicants who have completed 12 years of schooling and possess sufficient experience, are also engaged. At the moment the rapid expansion of secondary schools and the increase in the number of students have created a corresponding increase in the demand for teachers of all subjects, especially science. For this reason, in certain secondary schools in Afghanistan, foreign teachers are also recruited through direct negotiation with their governments.

All local teachers are regular government officials, and are promoted according to civil service rules and regulations.

Vocational and technical schools

Vocational training takes various forms:

1. Privately operated workshops take in apprentices to learn a trade under private instructors and artisans. During their term of apprenticeship they are paid a wage by the employer sufficient to meet their daily needs. After learning the trade they either continue work in the same shop as fully fledged artisans or set up shops of their own.
2. Several mills and factories have training workshops which accept young men as apprentices in specific fields of training. After completing the term of training and becoming proficient in their speciality, they are employed as skilled labour, usually in the same factory.
3. Basic vocational training is given in government schools. Through its Department of Vocational Education the Ministry of Education directs vocational education provided in the following schools: technical schools, the School of Commerce, the School of Agriculture, Teachers' Training Institute and colleges, institutions for theological training. Thus the duties of the Department of Vocational Education are somewhat different from those of similar departments in most other countries.

Mechanics' schools. These schools admit pupils who have completed primary school and offer a 3-year course. During 4 days of the week students receive practical training in various trades in the workshops. Theoretical training consisting of mathematics, drawing, technology, national languages, and German is given during 2 days of the week.

The first school in this category was the School of Mechanics in Kabul, which was established in 1937. It has the following sections: iron smithy, machine repair, tool making, foundry work, model making, low voltage and high voltage electricity, automotive repair and plumbing. After 3 years' training successful students are awarded the certificate of 'Skilled Technician' and the majority thereupon enter the various industries and technological institutions.

A secondary stage has recently been added to the school; this gives an additional 3 years' training and only exceptionally capable students are enrolled. Theoretical training during this period takes on greater importance. This upper stage is designed to train teachers for the School of Mechanics and prepare students for higher technical education.

In addition to the School of Mechanics in Kabul, two more such schools at the middle level, i.e., equivalent to the lower stage of the Kabul School of Mechanics, have also been established in Kandahar and Pakthia Provinces.

Afghan Institute of Technology. This institute was established in 1951; here greater emphasis is laid upon theoretical training. The graduates who enter employment are not mere 'skilled workers': they should be able to read the blueprints drawn up by the engineers and to work from them; they should be able to verify the practicability of projects submitted to them and to conduct and supervise these projects in the workshops; and they should have the ability and background to supervise persons responsible to them. The programme includes mathematics, applied science, shop courses, technical drawing, and specialized and general technical courses. During the first year all students follow a uniform course of basic subjects: English, mathematics, hand tools, Pushtu, Farsi, library work, sports, and supervised study. In the second year they have the opportunity to explore four areas: aeronautical, civil, electrical and mechanical engineering. The aeronautical course trains meteorologists and radio operators. The civil engineering course includes surveying, the study of building materials, and the theory and design of construction. The electrical course at present emphasizes communications, especially radio, and electrical power generation and its applications. The mechanical course includes both motor car repairing and the use of machine tools.

The medium of instruction in the institute is English. A special, intensive programme for teaching English has been established at the AIT by the experts who staff the institute's English department. During the first year it consists of 18 hours' teaching per week. As a result of this intensive training students acquire the ability to understand lectures and to read textbooks in English for the technical courses which they pursue for their remaining 2 years at the institute. The teaching of English continues throughout the 3-year school term. In the second year, the English course includes a review of English grammar, conversation, the reading of selected materials on scientific subjects, and composition. The third-year course adds the writing of business letters, the use of various forms, and report writing.

Agriculture. Training in agriculture is given at the School of Agriculture in Kabul. This school, which was established in 1925, admits pupils who have completed middle school and offers a 3-year course. During this period students receive practical training in agriculture. Theoretical training is given in English, mathematics, physics, chemistry, zoology, botany, animal and plant diseases, horticulture and agronomy. The school has its own experimental farm and workshops.

Commerce. The course lasts 6 years. The principal objectives are to produce a sufficient number of persons fully qualified to take up jobs in commercial organizations in the country, and to prepare selected students who show a high level of intelligence for higher training in business administration at the University of Kabul. The teaching programme is divided into two separate and distinct parts. The first stage of 3 years follows the same pattern of teaching as that of the secondary schools. In addition to this, a certain amount of training in economics is also given. Actual commercial correspondence and commercial subjects, such as accounting and book-keeping, are handled in the most simple and elementary manner.

The second stage is concerned with the actual vocational training. This stage also covers a period of 3 years, the whole of which is devoted to the teaching of economics and commercial subjects. The programme, which has been patterned on those of similar schools in Germany, Austria and Turkey, consists of economics, commercial correspondence, book-keeping, commercial geography, history of economics, technology, Islamic law, commercial arithmetic and mathematics. Typewriting takes an important place in the programme and English is taught side by side with Pushtu and Persian. Some of the teachers are Afghans, others of foreign extraction.

Arts and crafts. The most important school of this category is the School of Arts in Kabul which has departments of carpentry, bricklaying, tailoring, knitting and weaving, engraving and sculpture. Theoretical and practical training is given in this school and in addition to the national languages, Pushtu and Persian, German is also taught. Two more such schools have been established in Kandahar and Farah, but they teach only carpentry and bricklaying.

Home economics. Home economics has been included in the syllabus of all secondary schools for girls. Each school has a special section for regular classes in the subject. The remainder of the programme includes such subjects as sewing, knitting, cooking and child care. Foreign specialists have been imported for these sections, and with the co-operation of local experts, they have successfully drawn up a programme suited to the environment.

Other fields. Other fields of vocational education in Afghanistan include the teacher training institutes and theological schools, etc.

A large part of instruction at teacher training institutions has been devoted to teaching methods, handicrafts and agriculture. They are equipped with special experimental farms and workshops for woodworking and other handicrafts.

Theological seminaries are of two kinds: those which limit their lessons to traditional subjects and impart very little modern knowledge, and others which maintain a balance between religious and modern secular studies. Modern subjects taught in these institutions include science, mathematics, physics and chemistry and other subjects of social importance, such as history and geography. Graduates of such institutions join the Faculty of Islamic Law of the university.

Out-of-class activities

In all secondary schools in Afghanistan the students are given opportunities to take part in social activities. For example, there are school committees for cleanliness and sanitation, committees to arrange lectures and conferences, stage dramas and hold film shows, edit and publish the official organ of the school (if any), manage sports, supervise first aid programmes, scout activities and run the Junior Red Crescent Societies. These committees may have only a few members or a hundred or more students and they carry on their activities both within the school and outside.

Every school has a playground where the students practise individual and group sports every afternoon and form their own football, volleyball, hockey, basketball and other teams. The procurement and distribution of sports equipment is the duty of the Directorate General of Sports of the Ministry of Education; this department arranges matches, tournaments and athletics. The cost of sporting equipment, provided free to all sportsmen, is met out of the government budget. Prizes and trophies are also given by the Ministry of Education out of its own budget.

In certain secondary schools, particularly in boarding schools, clubs and co-operatives are set up by students with their own capital to provide some of their own school equipment and refreshments, etc.

TRENDS AND PROBLEMS

The number of secondary schools, whether academic or vocational, is still insufficient for the general needs of the country. Moreover almost all the secondary schools are of recent foundation and have not yet reached full development. One of the causes of the slow evolution of secondary education in this country is lack of finances. Although Afghanistan is spending huge sums on the development of educational facilities, the demands of the population, more and more of whom are sending their children to secondary schools, cannot be met. A rapid development of schools also means new buildings, more teachers and sufficient quantities of teaching materials. The only source of these is the State, therefore, despite the all-out efforts that are being made by the Government to meet these needs, the daily increasing demands on educational institutions and the unprecedented increase in the number of schools and students, together with the growing demand of the country for qualified technical personnel and secondary school graduates, make this a losing battle.

The economy of the country has also evolved during the past forty years with the attainment of political independence and the forging of economic and political

links with a large number of foreign countries. These changes have enabled the Government to make vigorous efforts for the amelioration of the economic plight of the people and raise their standard of living. This, in turn, has produced unprecedented activity. By establishing new factories, constructing dams and irrigation systems, reclaiming land for agricultural use, improving communications and roads, expanding imports and exports, introducing courses of adult education, encouraging education and training in modern technology, the Government has tried to improve the standard of living of the people and to prepare them for life in this machine age. This policy has inevitably increased the demand for secondary school graduates.

As yet, the desired standards of vocational education in Afghanistan are far from being reached, although the importance of this kind of education is being increasingly recognized, and the demands of industry and agriculture are effectively stimulating its development. A new plan to include vocational lessons in central as well as provincial schools has been drawn up and the day is not far off when vocational education will form part of the syllabus of all primary and secondary schools in Afghanistan.

While the development plans of the country have increased the need for graduates, the budget for the development of education has also been proportionately increased, so that opportunities are greater for the development of secondary school education (general and vocational) in Afghanistan.

STATISTICS

Population (mid-year 1958 estimate): 13,000,000.
Area: 251,000 square miles; 650,000 square kilometres.
Population density: 52 per square mile; 20 per square kilometre.

Summary of school statistics, 1953–57. Estimated enrolment at all levels of education was 141,500 students in 1957, representing little more than 1 per cent of the total population. In 1955, the latest year for which reasonably complete data are available, nearly 92 per cent of pupils were enrolled in primary schools, about 5 per cent in general secondary and teacher training schools at secondary level, 3 per cent in vocational institutions and under 1 per cent at the University of Kabul. Information on the proportion of girls enrolled at different levels of education is very incomplete. In 1954, girls made up only 8 per cent of the enrolment in primary schools and 18 per cent in secondary schools, and 53 women were attending the university; none were reported in vocational schools or teacher training courses. From the data available it appears that total enrolment at all educational institutions increased by about 27 per cent between 1953 and 1957 and the teaching staff at primary and secondary schools rose by 28 per cent over the same period. (See table.)

Educational finance, 1957. The total budget of the Ministry of Education for 1957 amounted to 164,755,751 afghanis (official exchange rate: 100 afghanis = 5.95 U.S. dollars), representing about 13 afghanis per inhabitant.

ALBANIA

THE EDUCATIONAL SYSTEM

The educational system of the People's Republic of Albania is governed by the Constitution of the Republic and by a number of laws, all of which were promulgated after the liberation of the country (1944).

The following are some of the main legislative measures on education now in force:

1. Decree No. 2064 of 6 June 1955 (approved by Law No. 2251 of 4 April 1956), concerning popular education.

   This decree, which replaces the School Reform Law of 17 August 1946, defines the aims, structure and organization of education in the People's Republic of Albania, from pre-primary schools (kindergartens) to the institutes of higher education (now faculties of the State University). The educational system thus defined comprises: (a) pre-primary education (3-year course for children between 4 and 7 years of age); (b) general education: primary (4-year course for pupils between 7 and 11); first stage of secondary education (3-year course for pupils between 11 and 14); and second stage of secondary education (4-year course for pupils between 14 and 18); (c) vocational and technical secondary education (4-year course for pupils between 14 and 18); (d) higher education (4- to 5-year course for students between 18 and 22); (e) adult education, provided at schools of different types.
2. Decree No. 1352 of 1 November 1951 (approved by Law No. 1431 of 5 March 1952), concerning compulsory primary education.

   This decree, which replaces the Decree of 17 August 1946, defines the period of compulsory education, the duties of parents and the legislative measures which must ensure the children's enrolment and regular attendance at the primary school.
3. Decree No. 1448 of 12 June 1952 (approved by Law No.

1653 of 30 March 1953), concerning the 7-year period of compulsory education.

This decree authorizes the Minister of Education and Culture to adopt special measures with regard to the towns and villages which must apply the system of 7 years' compulsory education for children between 7 and 16 years of age.

4. Decree No. 732 of 21 September 1949 (approved by Law No. 760 of 12 January 1950), making it compulsory for citizens to learn to read and write.

This decree has co-ordinated all the efforts made since the Liberation with a view to eradicating illiteracy among persons between 14 and 40 years of age. Thanks to the application of this measure, illiteracy among persons of this age-group was completely eradicated by 1955.

5. Decree No. 2476 of 1 June 1957, concerning the establishment of the State University of Tirana.

This decree has made it possible to combine the existing institutes in a single institution of higher education, designed to train a permanent senior establishment and ensure the multilateral development of education, science and culture in Albania.

Apart from these legislative measures, there are special decisions taken by the Council of Ministers, namely:

1. Decision No. 421 of 10 September 1949, to ensure free housing and heating for village teachers who come from other regions of the country.
2. Decision No. 129 of 9 April 1955, concerning the standard model regulations of technical secondary schools. This decision has served as a model for the organization of these schools within a single system, for the enforcement of the rules, etc.

The highest state authority responsible for education is the Ministry of Education and Culture, which directs and supervises teaching and instruction as well as the execution of the state plans for general education applicable in schools of every category.

The Ministry of Education and Culture is guided in its work by the decisions and directives of the Party and the Government and its aim is to provide the younger generations with a communist education and to disseminate culture among the masses. In accordance with the Constitution, it offers all sections of the people the opportunity of attending the schools and cultural institutes. It plays an important part in the development of education, but the competent organs of the local authorities (executive committees of the district people's councils) play an equally important role. In fact, the co-operation of these organs of the local authorities is obligatory with respect to a great number of matters connected with education such as the provision of school buildings, equipment, furniture and teaching aids; the planning of the number of pupils to be admitted to the various schools and the execution of the plans; the approval of secondary school fellowships; the assignment of teaching posts within each district and the definition of the required qualifications; the appointment of teachers, headmasters and inspectors. General secondary schools are under the direct control of the local authorities.

The diagram on page 171 shows the structure of the educational system in Albania.

THE DEVELOPMENT OF SECONDARY EDUCATION

The opening of the first teacher training school at Elbasan, in 1909 (during the Turkish occupation), marked the institution of undenominational secondary education in Albania. This school was maintained with the help of funds provided by Albanian clubs and associations in Albania and abroad.

After the creation of the Albanian State in 1912, the first measures were adopted with a view to the organization of state education. New primary schools were opened, as well as a teacher training school at Bérat. During the first world war, the Albanian administrations operating in the zones occupied by foreign armed forces established, in the towns, simultaneously with the increase in the number of primary schools, upper primary schools providing a 2- or 3-year course, as well as three secondary schools: the national secondary school at Kortcha (1917), the 2-year teacher training school at Scutari (1918), and the labour school at Argyrocastro. In 1920, after the consolidation of the Albanian State, measures were taken with a view to unifying the school system and organizing general and vocational education. Primary education was made compulsory for children between 6 and 11 years of age.

Subsequently, changes mainly affecting secondary education were introduced into the school system by the Organic Law on Education of 27 July 1928, the Legislative Decree No. 54 of 28 September 1934 and the Law of 6 June 1938, to reform the secondary schools. Besides limiting the number of secondary schools these frequent changes lowered the standard of education, owing to the lack of stability. In 1938–39, the school system comprised:

1. A 5-year primary school.
2. Secondary education, provided at the gymnasium and *lycée* types of school, the teacher training schools, the commercial institutes and the vocational schools.

   The gymnasium type course consisted of two cycles, each lasting 4 years, and comprised two sections (classical and modern). The first cycle also prepared pupils for the teacher training schools and the commercial institutes.
3. Vocational education, which was given at the labour schools (2- or 4-year course) and the technical institute (8-year course following on primary education). The technical institute provided a lower course and a higher course, each lasting 4 years. The higher course was also open to pupils who had completed the 4-year course at a workshop school.

Between 1920 and 1939 (the year when Albania was occupied by fascist Italian forces) education was characterized, in general, by the shortage of primary schools, particularly in the villages, by the undue restriction of general secondary education, which had become a privilege of a minority composed of the ruling classes and the richest sections of the population, by the precarious conditions of secondary vocational and technical education, and by the total lack of higher education.

In 1938–39, there were: (a) 643 primary schools, with 1,340 teachers and 52,024 pupils (82 per cent of the population were illiterate); (b) 2,563 pupils attending schools of the first stage of secondary education; (c) 6 gymnasium type schools, with 817 pupils (second stage); (d) 3 teacher

training schools, with 675 pupils (second stage); (e) 2 vocational secondary schools, with 204 pupils; (f) 11 vocational schools (first stage), with 2,056 pupils.

After the liberation of the country and the establishment of the people's government, radical changes were introduced into the system, organization and contents of education in general.

The School Reform Law (17 August 1946) established an educational system with the following characteristics:

1. The duration of primary education was fixed at 4 years and primary education was made compulsory for children who had reached the age of 7 years.
2. The duration of the first stage of secondary education was fixed at 3 years and this stage was combined with the new 4-year primary school so as to form a 7-year school. This measure made it possible to develop secondary education first in the towns and then in the villages, and to extend the period of compulsory education gradually to 7 years.
3. The duration of the second stage of the secondary schools (gymnasium type, teacher training school, vocational school) remained fixed at 4 years (with certain exceptions).

The extension of the network of 7-year schools prepared the way for the gradual transition to the 11-year schools of general education and for the development of the network of vocational and technical schools.

The administration of the schools of general education, which formerly depended essentially on the Ministry of Education, has gradually passed into the hands of the local authorities, whose area of competence is constantly increasing.

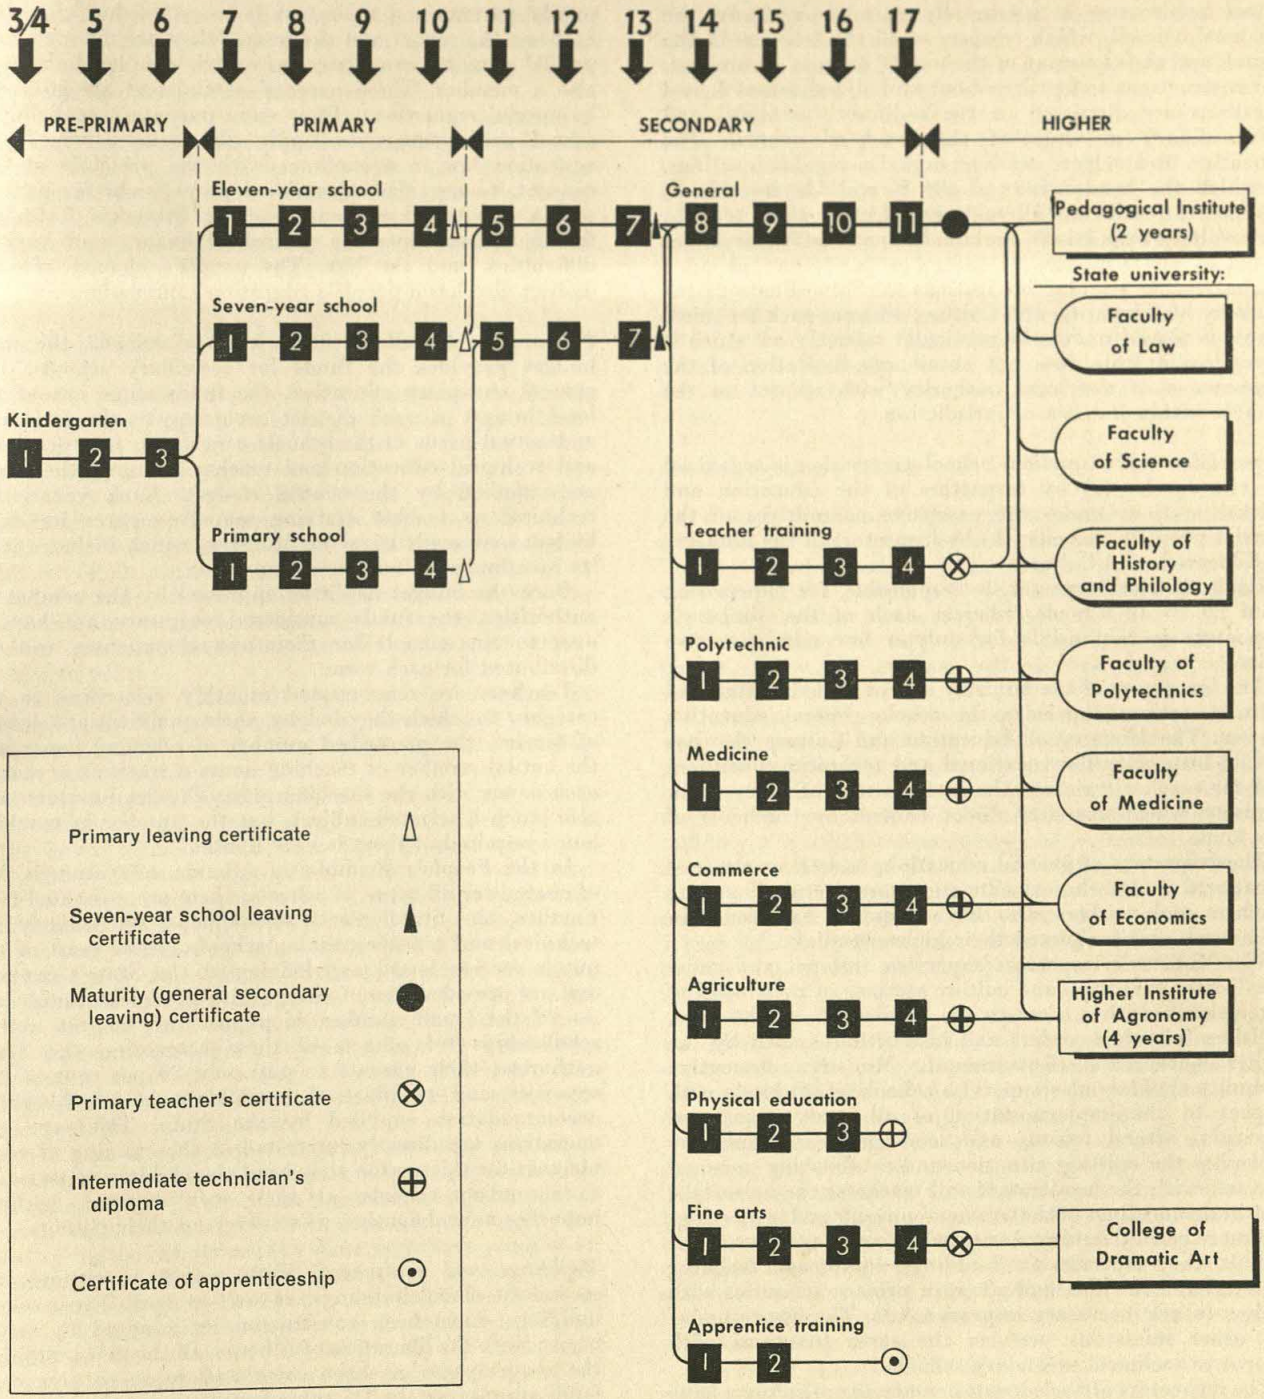
The study plans and curricula of all types of schools have been radically modified. Greater attention is paid to the teaching of science and of Albanian (the pupil's mother tongue).

The institution and extension of higher education are due to the efforts of the people's government, set up after the liberation of Albania.

Legal basis

The principal laws and legal provisions now in force respecting general and technical secondary education have already been mentioned. Nevertheless among the measures which have influenced and still affect secondary education, special attention must be drawn to the following:

1. Law No. 1653 of 30 March 1953, relating to the 7-year period of compulsory education.
2. Decision No. 129 of the Council of Ministers of 9 April 1955, relating to the standard model regulations governing the *technicums* (technical schools).
3. Government Order No. 19 of 17 May 1952, concerning the training of a permanent senior establishment by means of vocational schools and training and refresher courses.
4. The regulations relating to the administration of educational establishments.
5. The regulations relating to the organization of examinations at the end of each school year.



Administration

The plan for the organization of secondary education is established by the Ministry of Education and Culture, in accordance with the laws and other legal measures in force, and with the help of the bodies specially set up for that purpose. The Ministry is authorized to issue regulations, publish circulars and instructions and put out special publications concerning the administration of secondary schools. These documents may be discussed during larger meetings attended by competent persons not belonging to the Ministry. Attached to the Ministry of Education and Culture is a permanent advisory body, as well as a council specially set up to deal with teaching methods; but it is the Ministry itself which sees to the preparation of the curricula, textbooks and other teaching material, teaching aids, etc.

Control. In accordance with Law No. 2251 of 4 April 1956, concerning popular education, the Ministry of Education and Culture exercises control over general secondary education and teacher training, and, in co-operation with the other competent Ministries, over all vocational and technical secondary schools. It ensures the application of the law concerning the 7-year period of compulsory education and the enrolment of the prescribed number of pupils at general and technical secondary schools. It carries out its tasks through its various organs and through those of the local authorities, namely the education and culture sections of the executive committees of the district people's councils. In fact, general secondary schools (first and second stages) come under the authority of the district executive committee, which organizes, controls and supervises them, through its education and culture section, in accordance with the Ministry's instructions and with due regard to the existing needs. The Ministry's instructions are binding on the schools, but, at present, the competence of the local authorities is being extended, particularly with regard to the upkeep of secondary schools, material requisites and the assignment and transfer of teachers.

An Institute of Advanced Training acting under the Ministry assists with respect to methodological questions and the training of teachers. The executive committees of the main districts have a similar organ, but of a lower level, namely the pedagogical centre, where exchanges of experience as well as local refresher courses for teachers are organized.

The education and culture sections are in direct contact with the schools; they are not only technical bodies under the district executive committees, but also act as liaison members between the various educational establishments and the Ministry of Education and Culture. Every category of school of general education, as well as the pre-primary schools and evening schools for adults in the same district, are administered by that district's education and culture section. Every secondary school (including the fifth-, sixth- and seventh-year classes of the 7-year schools) has a headmaster and frequently an assistant headmaster. Special provisions and regulations give the headmasters and assistant headmasters sufficient powers to enable them to ensure the application of the laws, orders and circulars of the higher educational authorities. Every secondary

school headmaster is assisted by an advisory body, the teachers' council, which consists of all the teachers of the school, and the chairman of the pupils' parents' committee. The instructions to be carried out and all important school questions are discussed at the ordinary (monthly) and extraordinary meetings of the teachers' council. The education and culture sections organize regular meetings, in which the headmasters of the 7- and 11-year schools take part, to discuss all matters affecting their schools, the results of inspections, the circulars and various directives issued by the Ministry.

The teacher training institutions are subordinate to the Ministry of Education and Culture, whereas each technical school is placed under the particular ministry on which it depends, but this does not entail any limitation of the competence of the local authority with respect to the schools within its area of jurisdiction.

Supervision and inspection. School supervision is organized on two levels: (a) by inspectors of the education and culture sections under the executive committees of the district people's councils; (b) by inspectors of the Ministry of Education and Culture.

Each district inspector is responsible for supervising from 20 to 30 schools, whereas each of the Ministry's inspectors is responsible for only a few administrative units.

The inspectors of the Ministry and of the education and culture sections supervise the whole general education system. The Ministry of Education and Culture also has special inspectors for vocational and technical education, and for teacher training; the same is true of every other ministry which exercises direct control over schools of this kind.

The inspectors of general education, as well as those of vocational and technical education, are recruited among teachers and workers who have acquired experience in their work and completed their higher studies.

The Ministry's inspectors supervise, instruct and assist the district education and culture sections in their work of organization with a view to the application of the laws, decisions, circulars, orders and instructions issued by the higher authorities (Government, Ministry, Executive Committee). They also supervise schools of all kinds with respect to the implementation of all study plans and curricula, attend lessons and lend their assistance by analysing the existing situation and establishing personal contacts with the headmaster and teachers; they also take part in the meetings of the teachers' councils and in meetings of a more general nature. As regards the management of the schools, they supervise the buildings, equipment, teaching material and the like, and adopt or propose measures with a view to any necessary improvements. The inspectors of the other ministries perform the same functions with respect to technical secondary schools.

The inspectors of the education and culture sections have the same duties and responsibilities, but while exercising direct control, they maintain closer relations with the headmasters and teachers of the schools concerned.

Apart from the state authorities, which give assistance and exercise control, there are social organizations set up inside the schools themselves. These bodies consist of the pupils' parents and their task is to establish a close link between the school and the home; they are directed by a pupils' parents' committee, of which the headmaster is also a member. These parents' committees are governed by special regulations. Their main purpose is to help the school management to apply the compulsory 7-year education law in accordance with the principle of free consent, to organize educational propaganda for parents with a view to the application of the 'Students' Rules', to find better solutions for the school finance and hygiene difficulties, and the like. The people's council of each district also has a people's education commission.

Finance. As for all the other kinds of schools, the state budget provides the funds for secondary schools. For general secondary education, the funds come out of the local budget of each district according to the estimates and actual needs of the schools concerned; for vocational and technical education and teacher training, the funds are supplied by the central budget. Each vocational, technical or teacher training school prepares its draft budget and sends it to the Ministry, which includes it in its own budget after due examination.

Once the budget has been approved by the competent authorities, the funds considered necessary are handed over to the schools for their annual expenses and are distributed for each term.

Teachers are remunerated monthly, according to the category to which they belong, their qualifications, length of service, the prescribed number of teaching hours and the actual number of teaching hours a week or a year in accordance with the teaching plan. The headmasters may also teach a selected subject, but the number of teaching hours required of them is very limited.

In the People's Republic of Albania, education is free of charge for all types of schools; there are no school fees. Further, the State grants scholarships, particularly for technical and teacher training schools, where most of the pupils receive board and lodging at the State's expense and are provided free of charge with the books they need. As to the small number of pupils who do not obtain scholarships for schools of these categories, the State authorizes their parents to pay only 20 per cent of the expenses and to place their children in the boarding accommodation supplied by the State. The rural co-operatives are directly interested in the training of technicians; for this reason they send the children of peasants to secondary schools, at their own expense, without imposing any obligation whatsoever on their parents.

Buildings and equipment. With a few exceptions, all secondary school buildings, as well as most 7-year school buildings, have been constructed, or adapted to actual needs, since the liberation of Albania. In the new buildings, the room space has been calculated so as to give each pupil approximately 335 cubic feet of space; the plans put into effect during the last few years have increased this figure to approximately 583 cubic feet for each pupil.

School welfare services. Welfare services have been established at the secondary schools; they are responsible for the health, cleanliness and minor material needs of the

pupils and upkeep and orderliness of the school buildings.

As regards the pupils' health, there are complete medical inspections (general medicine, radiology, dentistry) and each pupil has his own health record book.

During the last few years, with a view to ensuring a good material preparation for the new school year, the practice of having schools sponsored by state enterprises or co-operatives has been successfully followed. Every secondary school is sponsored by an enterprise which maintains close contacts with it and thus ensures liaison between the school and practical life.

TYPES OF SECONDARY EDUCATION

Pupils who complete their primary education have access only to the first stage of secondary education. The schools providing this type of education give a 3-year course (fifth-, sixth- and seventh-year classes). The second stage of secondary education comprises 4 years' studies following immediately after the course of the 7-year school and is sub-divided into general education and vocational and technical education. General education is continued in the eighth-, ninth-, tenth- and eleventh-year classes, whereas vocational and technical education is characterized by a different denomination of the classes (first-, second-, third- and fourth-year).

Vocational and technical education is provided at technical schools (*technicum*), apprenticeship schools (vocational schools of the first stage), teacher training schools and art schools.

In order to guide pupils and their parents and enable those concerned, after they have completed their studies at the 7-year school, to continue their general education or to choose the most appropriate technical or vocational school, the school managers carry out organized propaganda, explaining the aims of the schools as well as the possibilities and prospects which they offer their pupils after they have completed their studies there. Further, the school managers organize visits and meetings in the schools for the benefit of the seventh-year class pupils. Every vocational and technical school usually publishes a booklet containing information about the courses of study and work, the school buildings and boarding facilities, the school traditions and the conditions of admission.

Pupils who have completed their secondary education can continue their higher studies as follows: (a) those who have completed their studies at a general secondary school (11-year school) can enrol at any university faculty or school of higher education; (b) those who have studied at a technical secondary school (*technicum* of any kind) can undertake higher studies at a university faculty or a school of higher education providing the same specialized teaching as the *technicum* they attended; (c) those who have attended a secondary teacher training school can follow the courses of a university faculty or of a school of higher education providing training for teachers; (d) those who have studied at a secondary school of fine arts (advanced art school) are entitled to engage in higher studies in a faculty of literature either at the university or at another higher educational establishment.

At the general secondary schools (fifth-year class to the eleventh-year class), the courses begin on 1 September and they end between 4 and 22 June (according to the classes and according as the pupils are preparing for the annual examinations or the school-leaving certificate). The school year is divided into three terms: first term, 1 September to 27 November (holidays from 28 November to 3 December); second term, 4 December to 28 February (holidays from 1 to 10 March); third term, 11 March to 4 or 22 June (summer holidays from 5 or 23 June to 31 August). The school year covers 33 school weeks.

At the vocational and technical schools (from the first-year class to the fourth-year class), including the art school, the courses begin on 1 September and end on 30 June (or 15 July). The school year is divided into two semesters, 1 September to 25 January and 8 February to 30 June or 15 July. The school year comprises 36 school weeks.

General secondary schools

As already indicated, general secondary education is provided at two types of schools: (a) the incomplete 7-year secondary school (fifth-, sixth-, and seventh-year classes); (b) the complete 11-year secondary school (from the fifth-year class to the eleventh-year class).

Corresponding to these schools and bearing the same names, there are evening schools and correspondence schools for adult workers.

The tasks of these schools are as follows: (a) the first stage of general secondary education (classes 5 to 7) provides pupils with elementary scientific knowledge and initiates them in productive work with a view to rendering them fit for practical life, for active participation in the building of a socialist community and for further studies at secondary schools of the second stage; (b) the second stage of general secondary education (classes 8 to 11) continues and completes the instruction given at the 7-year school by providing pupils with elementary polytechnic knowledge and by preparing them for higher studies.

Pupils who successfully complete the courses given at the above-mentioned schools of general secondary education are entitled to continue their studies at a higher level without any hindrance. Adult pupils following evening or correspondence courses enjoy the same rights.

With the exception of the art schools, there is no special selection of pupils for schools of any type or category. The boards attached to the district executive committees for the purpose of approving scholarships, take into account the state plan to satisfy the country's needs for a staff of qualified senior workers, as well as the real needs of the different sectors within their jurisdiction, and endeavour to find employment for these workers in their native region or in the vicinity thereof.

The study courses of the fifth-, sixth- and seventh-year classes include systematic courses in Albanian (grammar and spelling), as well as the reading of literary texts devoted to a given subject (fifth-year class) or chosen according to an historical or chronological criterion (sixth- and seventh-year classes).

The study of Albanian which is continued in the eighth- and ninth-year classes, includes questions of morphology

TIME-TABLE FOR GENERAL SECONDARY SCHOOLS
(in periods per week)

Subject	Classes (year)

and syntax. In the eighth-year class, the literature course includes the study of the complete texts of three or four small works by well-known Albanian authors; this study bears upon the contents, style and artistic form of the texts. In the ninth-, tenth- and eleventh-year classes, the syllabuses include a systematic historical and literary study of Albanian literature and of foreign literature, bearing mainly on certain great authors.

Arithmetic is taught during the fifth year and the first half of the sixth year, the study of this subject is continued during the seventh year until pupils are able to solve quadratic equations. In the fifth and sixth years, pupils acquire elementary knowledge of geometry through arithmetic, and in the seventh year they begin a systematic study of geometry.

The study of algebra begins in the seventh year and is continued in the other classes until pupils have learnt the rudiments of mathematical analysis. The complete study of geometry is organized as follows: plane geometry in the eighth and ninth years; stereometry in the tenth year; plane trigonometry in the eleventh year.

A first course in physics and chemistry is given in the seventh year.

A second and complete course in physics, which bears upon mechanics, heat, electricity, optics, the atom and the corresponding laboratory work, begins in the ninth year.

The systematic study of chemistry, which begins in the eighth year, relates mainly to the following: elementary theoretical knowledge of chemistry based on the molecular and atomic theory; chemical nomenclature; periodical classification of the elements; phenomena of chemical analysis and chemical statics; general properties of metals and a study of some of the metals which are of the greatest practical importance; fundamental principles of general chemistry and of organic chemistry. The practical agricultural work in the workroom and the school garden (fifth-, sixth- and seventh-year classes) comprises cardboard work, papier mâché work and woodwork, as well as work relating to vegetable growing, agricultural plants, the breeding of small domestic animals, etc.

The syllabuses of practical and agricultural work for the eighth-, ninth-, tenth- and eleventh-year classes include certain general technical subjects (fitting in the eighth-year class, study of machinery in the ninth-year class, automobiles or tractors and electrotechnics in the eleventh-year class). In the tenth-year class, the practical work relates to industrial or agricultural production. These subjects change according to the region in which the school is situated.

The teaching methods depend, firstly, on the nature of the subjects taught, and, secondly, on the age of the pupils, the level of studies of the different classes, etc. In this respect, teachers find general information in the syllabuses and the accompanying instructions, the texts and handbooks used for the teaching of the various subjects, special educational publications, methodological works, etc.

Achievement testing. A system of 5 marks is used for the appraisal of the pupils' results. Pupils who obtain 5, 4 or 3 marks are entitled to promotion, whereas those who obtain only 2 or 1 are not. The results are communicated to those concerned at the end of each school period (term or semester), and, at the end of the school year, they receive marks for all the work they have done during that year. For the reports at the end of each term or semester, account is taken of the marks obtained by each pupil for his oral and written work as well as for his homework, but this is not done mechanically by adding up or dividing these marks. Teachers also take into consideration the pupil's progress during the period concerned (a drop in the pupil's marks from 4 to 3 and then to 2 is by no means appraised in the same way as progress from 2 to 3 and then to 4, although the arithmetical mean is the same in both cases). The end of the year results are similarly appraised, but the results of the different periods of the school year are taken as the basis for this appraisal.

In the seventh- and eleventh-year classes, as well as in the terminal classes of the technical secondary schools and teacher training schools, there are special examinations for those wishing to enter a school at a different level. Formerly, end of the year examinations existed for the other classes, but they have been abolished. These examinations for promotion do not include all the subjects taught. As regards the subjects not covered by the examination the annual results are mentioned on the certificate. The following procedures are adopted as regards the subjects set for examination: if the final marking at the end of the year is 5, 4 or 3, the pupil is entitled to sit for the examination and his examination marks are noted on the certificate. In order to obtain promotion from the seventh-year class, the pupil's marks for the end of the year examination must be equivalent to the 'fair' mark. If he obtains a lower mark in one or two subjects he must sit for the examination again in the autumn. If, in autumn, he again fails, even in one subject only, he must spend another year in the same class. In the eleventh-year class, there is a final examination which is open to pupils who, during the year, have obtained 5, 4 or 3 marks for all subjects, including those set for this examination. Pupils who are not admitted to the final examination must pass a special examination during the following school year in

order to be able to sit for the final examination. Those who fail to pass the final examination are entitled to sit for it again at the end of the following school year. Pupils who are not admitted to this examination or who fail to pass it are not entitled to continue regular studies, but they can study on their own and sit for the examinations as outside candidates.

The examinations are held in the presence of the state boards of examiners which must include the following persons: the teacher in charge of the subject set for examination, one or two other teachers who teach the same or a related subject, the headmaster of the school concerned and a representative of the education and culture section (for the seventh-year class) or of the Ministry (for the eleventh-year class).

Teachers. At schools of the first stage of general secondary education, teachers must have completed, at a 2-year teacher training institute, the courses of the faculty corresponding to the subjects they are to teach. At schools of the second stage of this branch of education, teachers must have studied for 4 years at the university faculty corresponding to the subjects they are to teach. In both cases, teachers are appointed and assigned to their first post by the Ministry of Education and Culture. Any subsequent transfers are decided by the local authorities.

Vocational and technical schools

Technicum. The *technicum* school is a state institute, established for the purpose of training intermediate technical workers for the different branches of production (industry, agriculture, handicrafts) as well as for the various branches of administration (economists, accountants, etc.) and physical education. There are six types of *technicum:* industrial, agricultural, zootechnic, economic, medical, and those specialized in physical instruction.

The industrial *technicum* is the most highly developed and comprises the following schools: the *Polytechnicum* '7 November', which has three sections (engineering, electricity, mineralogy and geology); the petroleum *technicum;* the construction *technicum.* The agricultural type has developed considerably and consists of four schools. Each of the other types of *technicum* comprises only one school. There are in all 11 *technicums*, including the physical education *technicum*, where the course lasts only 3 years, whereas at the others it lasts 4 years. The courses at the *technicums* are all given at the secondary level.

The mode of recruitment of pupils, who all come direct from the seventh-year classes, has already been described.

The subjects taught at the *technicums* are divided into two main groups: general culture (Albanian language and literature, foreign language, mathematics, history, etc.); technical subjects (general and special). The following table gives a general idea of the allotment of time to these groups of subjects and to practical training in the main types of *technicum.*

The total number of hours indicated in the table also includes the hours spent in laboratory work.

The general cultural subjects are included in the syllabuses for the first 3 years, whereas the teaching of the technical subjects begins only in the third year, except in one particular case when it begins in the second year. It is during the third year that emphasis is placed on the specialized teaching particular to each *technicum.*

ALLOTMENT OF TIME IN *TECHNICUMS*
(in hours for entire course)

Type of *technicum*	General cultural subjects	Technical subjects	Practical work	
			at school	in production
Industrial . .	1 840	2 110	500–850	300–700
Agricultural . .	1 740	2 060	640	900
Economic . . .	1 800	2 600	—	360

One day per week (6 hours) is devoted to practical work (except at the agricultural *technicum*, where this work takes place during different seasonal periods).

Every semester, pupils are ranked in their order of merit and, at the end of each semester, they sit for an examination on the subjects included in the curriculum. At the end of the course, pupils of the industrial *technicum* sit for the examinations for the diploma, before a special state board of examiners whereas pupils of the other *technicums* sit for state examinations bearing on the three or four most important subjects. Successful pupils of each *technicum* receive the intermediate technician's diploma.

School results are marked in accordance with the same criteria as those applied in the general secondary schools.

At the *technicums*, the time prescribed for each class is two consecutive hours.

In accordance with the general methodological instructions, teachers employ particular teaching methods according to the requirements of each subject and each class and with due regard to their own personal experience. For technical subjects, in respect of which there are no directives, the commissions responsible for the different subjects play an important role. They organize meetings which discuss the means of raising the scientific and educational level of the courses and of comparing the experience of the various teachers.

Teachers of general cultural subjects are trained and recruited in the same way as teachers at schools of the second stage of general secondary education. They must have completed special higher studies at the faculties of engineering, medicine, agriculture, etc.; and, in accordance with the most recent provisions, they must have completed at least 3 years' practical experience in productive work before being posted to a school. In addition to the permanent teaching staff, the technical courses are given by engineers or highly qualified technicians who are engaged in other work outside these schools. Nevertheless the number of these teachers is diminishing, for the number of permanent teachers specially trained for the *technicums* is constantly increasing.

Apprenticeship schools (elementary vocational schools). Apart from the *technicums*, which train intermediate technical workers whose diplomas entitle them to undertake higher studies, there is a number of elementary vocational schools, providing a 1- or 2-year course for training skilled workers for industry, the building trades, and agriculture. The industrial vocational schools are

called apprenticeship schools, and the vocational schools for agriculture are known as agricultural courses. The former are attached to productive enterprises (factories, mines, work yards, etc.). They are open to pupils who have completed their studies at the 7-year school; the school week consists of 6 days, 3 for class work and 3 for practical work. Pupils who successfully complete their studies at these schools have acquired specialized training in a particular trade: turning, machinery fitting, masonry, carpentry, etc.

Those wishing to do so can continue their studies at a *technicum*, where they are admitted to the first-year class.

Teacher training schools

There is only one type of teacher training school; the course lasts 4 years (8 semesters) and follows immediately after the 7-year period of compulsory education. Internal examinations are held at the end of each semester and state examinations at the end of the 4-year course; successful candidates are entitled to teach in schools.

Students at the teacher training schools are mostly of peasant origin and benefit by scholarships or board and lodging facilities in the state boarding schools, where they pay only 12 per cent of the expenses.

As already indicated, these schools do not recruit their students on a selective basis.

The teacher training schools are directly subordinate to the Ministry of Education and Culture, which deals with questions relating to curricula, textbooks, staff and finance; but the competent organs of the local authorities have the right to supervise these schools. The curricula include subjects of general education as well as pedagogic matters. The general education which students acquire at the teacher training schools is virtually the same as that acquired by pupils at the schools of the second stage of general secondary education (from the eighth-year class to the eleventh-year class), except for the fact that certain subjects, particularly mathematics, are simplified. Special textbooks for these subjects have been prepared. The total number of teaching hours for the 4 years is 4,450, of which 3,757 are devoted to subjects of general education and the rest to teaching theory and practice. Great importance is attached to the teaching of Albanian.

Annexed to every teacher training school is a lower primary school where student teachers attend lessons and practise teaching.

Teachers at the teacher training schools are carefully selected by the Ministry of Education and Culture; they must not only possess the prescribed university qualifications (diploma conferred on the termination of higher studies) but must have gone through the required probationary period. Teachers at the lower primary schools annexed to the teacher training schools are also carefully selected.

Schools of fine arts

The art school which was established after the Liberation, provides second stage courses in secondary education, first stage courses, and in the case of a few special subjects, primary courses. Studies last 11 years, beginning from the first-year primary class. The fifth-, sixth- and seventh-year classes have a regular course in general education; pupils devote 3 or 4 hours more per week to learning special subjects. Pupils of the eighth-, ninth-, tenth- and eleventh-year classes (Classes 1 to 4) work approximately from 32 to 40 hours per week; for these pupils the number of hours of general culture represents from 50 to 60 per cent of the total number of class hours.

The task of this *lycée* is to train intermediate specialists for the various arts: plastic arts, music, the theatre. Pupils are recruited on the basis of two competitive examinations, the first is held before a district examining board, whereas the second examination which is reserved for those who passed the first test is held before an examining board constituted at the school itself. Students who pass the examinations with honours can obtain employment at one of the various art institutions, with the right to continue their higher education at the faculty of history and philology (faculty of letters) of the State University.

Out-of-class activities

The participation of pupils in school government and school life is a characteristic feature of general and technical secondary schools and teacher training schools. In fact, pupils of the fifth-, sixth- and seventh-year classes are grouped in pioneer organizations and those of the eighth-, ninth-, tenth- and eleventh-year classes, in the youth organization. These organizations, by ensuring the pupils' participation in school life, give valuable assistance to the school management and teachers. Thus, for instance, the pupils themselves maintain order and discipline during the recreation periods, not only in the classrooms, but also in the corridors and on the playgrounds. Further, various social activities are organized on the occasion of holidays together with artistic entertainments and group excursions; the pupils are also responsible for cleaning the premises and maintaining the gardens and playgrounds.

In order to develop their talents and to make teaching and learning living things the pupils, with the help of their teachers, have created various literary, artistic, scientific and technical clubs, as well as naturalists and sports clubs. These clubs organize special activities on the occasion of holidays and important events in the life of each school.

Pupils also take part in various sports and sporting competitions. For that purpose, they organize athletic, football, volley-ball and wrestling teams and matches are held between the different schools.

The art movement is also being given full play at the present time in the schools. Artistic shows of various kinds are organized not only at the end of each school year, but often at the end of each term or semester.

Apart from all this, secondary school pupils profit by their holidays by doing useful work in the farm co-operatives and the productive centres. They have also begun, particularly during the last two or three years, to take an interest in the discovery of mineral deposits.

Thus, out-of-school activities not only contribute to the pupils' intellectual and aesthetic development, but they also make it possible to give this development a social meaning by bringing it into closer connexion with the country's material situation and its general progress.

TRENDS AND PROBLEMS

The various explanations given above show that the main features in the development of secondary education in the People's Republic of Albania, particularly during recent years, are as follows:

1. The organization of this branch of education in two stages has rendered possible the gradual extension of the first stage, integrated in the 7-year school, to the entire country, as well as the gradual transformation of a large number of 7-year schools into 11-year schools, beginning with the most populated towns and centres.
2. Vocational and technical secondary education and teacher training attract a considerable number of the pupils who have completed their studies at the 7-year schools and wish to complete their secondary education. This makes it possible to train technical secondary school teachers, who will become more and more necessary as the national economy develops.
3. Secondary education for adult workers is an effective means of enabling those interested to complete their secondary studies without interrupting their work. The secondary evening schools and correspondence schools have largely helped to develop the aptitudes of young workers and this opportunity must be extended to all those who have not had or will not have the possibility of completing their secondary education.
4. The possibility of adapting the plans of study more and more so as to link science to practical work and school life to everyday life has been a matter of great concern during the last four or five years and the competent authorities are devoting their most earnest attention to the matter.

At present the main requirement is to ensure an increasingly better organization of the second stage of secondary education and a better distribution of the pupils between general secondary education and vocational and technical secondary education.

Since the Liberation, Albania has been laying the foundations of a system of secondary education in accordance with the needs of its economic, social and political development.

STATISTICS

Population (mid-year 1958 estimate): 1,507,000.
Area: 11,100 square miles; 28,748 square kilometres.
Population density: 136 per square mile; 52 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, total enrolment in educational institutions at all levels was nearly 234,000 pupils, representing 16 per cent of the population. There were, in addition, some 16,500 people attending adult education courses. Of the school-going population, 7 per cent were pupils in kindergartens, nearly 86 per cent in primary schools, 2 per cent in general secondary schools, under 3 per cent in vocational courses, 1 per cent in teacher training schools and 1 per cent at higher educational institutions. Over a quarter of primary pupils were in schools with 7-year courses and the remainder were in 4-year courses. Girls made up 46 per cent of the enrolment in primary schools compared with 45 per cent in 1953/54, and 38 per cent in general secondary schools against 34 per cent at the beginning of the period under review. At teacher training courses women were over one third of total enrolment and 15 per cent at higher educational institutions. The teaching staff at all levels of education numbered nearly 8,400 in 1957/58 an increase of 26 per cent over 1953/54. At most levels of education recent data on numbers of women teachers are lacking. The pupil-teacher ratio in primary schools was 30 in 1957/58 against 32 in 1953. In general secondary schools, however, the ratio was 21 compared with 16 in 1953.

During the period under review, enrolment increased by over 150 per cent in general secondary schools, by 15 per cent in primary schools, and students in higher educational institutions trebled. On the other hand, enrolment appears to have declined in technical education and in secondary teacher training schools. (See Table 1.)

Enrolment trends in secondary education, 1950–57. Over the 8 years under review, enrolment in general secondary education more than trebled and the proportion of girls increased from 27 per cent to 38 per cent. Enrolment in vocational education declined somewhat from the peak in 1952 and in secondary teacher training schools enrolment has fluctuated from year to year. Average enrolment in all branches of secondary education increased from 10,000 in the period 1950–54 to 13,000 in the three years 1955–57 and the ratio of enrolment to estimated population 15 to 19 years old passed from 8 to 9 over the corresponding periods. (See Table 2.)

Educational finance, 1958. Total expenditure in the 1958 State Budget for Education, Culture and Social Affairs amounted to 4,971.5 million lekë. (Official exchange rate: 100 lekë = 2 U.S. dollars.) Details of the proportion spent on education are not available.

1. Included in higher general and technical.
2. Two-year course only. Data for senior Teacher Training Institute are not available. In 1954/55 this institute enrolled 243 (F.64) students in the 4-year course.
3. Including teachers of higher teacher training and night courses.
4. Included with corresponding type of day school.
5. Already counted under regular secondary teacher training.

2. TRENDS IN SECONDARY EDUCATION, 1950–57

School year	Number of students enrolled by type of education						Average total enrolment (000's)	Estimated population 15–19 years old (000's)	Secondary enrolment ratio
	General		Vocational		Teacher training

ANDORRA

The Valleys of Andorra form an independent State in the Pyrenees, the political status of which is regulated by agreements going back to mediaeval times. Andorra is placed under the joint suzerainty of the President of the French Republic and the Bishop of Urgel in Spain; the two Co-Princes are represented in Andorra by the Viguier de France and the Viguier Episcopal.

Custom is the main source of law. Heads of families are entitled to choose any of various forms of education for their children: education at home; at a private school; at schools established in Andorra at the instance of the Co-Princes; at schools outside Andorra. At present, France and Spain each maintain one or two primary schools in each village. There are also a number of nursery schools.

The French schools are mixed schools operating in accordance with the French regulations as regards the recruitment, remuneration and supervision of teachers, curriculum, time-table, certificates and examinations—the only difference being that the study of Catalan is included in the curriculum.

These schools come under the inspectorate of primary schools at Prades (in the *département* of Pyrénées-Orientales) and, more generally, under the *académie* (education authority) of Pyrénées-Orientales. The purchase and maintenance of school buildings and furniture are the responsibility of the parish; school supplies are provided by France free of charge. Teachers of Andorran extraction, holding the *baccalauréat*, receive priority for appointments to French schools in Andorra. Lastly, as far as education is concerned, the Valleys of Andorra are treated not as foreign territory but as a French educational district, with all the freedom which that implies (public or private schools, conducted by religious orders, etc.).

Spanish primary schools have separate classes for boys and girls. The curricula are on the lines of the system in force in Spain. The pupils learn Catalan and the teachers and the school inspector are paid by Spain. The communal authority or *comu* provides and maintains the school buildings and furniture. The decision as to the appointment, transfer and dismissal of Spanish teachers lies with the Spanish Government which must first obtain the approval of the Bishop of Urgel. There are three schools run by religious orders and subsidized by the Spanish Government at Andorra la Vieja, San Julian de Loria and Les Escaldes.

SECONDARY EDUCATION

For children in the French educational system there is a continuation school (*cours complémentaire*) at Andorra la Vieja. This offers the 4-year course leading to the lower secondary certificate (*brevet d'études du premier cycle*). An agricultural section for boys and a rural home economics section for girls are attached to this school. Pupils wishing to pursue other secondary or higher studies may do so in France. A number of scholarships are available.

Secondary education for Andorran children enrolled in the Spanish system is provided in the school at Seo de Urgel (Spain), just over six miles from the frontier of Andorra, and higher education in the Spanish universities. The Spanish Government grants scholarships or bursaries to the most outstanding pupils.

[*Text prepared by the Unesco Secretariat from official sources in September 1959.*]

STATISTICS

Population (mid-year 1958 estimate): 6,000.
Area: 175 square miles; 453 square kilometres.
Population density: 34 per square mile; 13 per square kilometre.

Summary of school statistics, 1953–57. Enrolment in 17 French primary schools and 1 secondary course in 1957/58 numbered 684 pupils of whom 46 per cent were girls. Enrolment in French schools had thus increased by 56 per cent compared with 1953/54. The teaching staff numbered 28 in 1957/58 compared with 17 in 1953/54 the pupil-teacher ratio falling from 26 to 24.

Recent information on Spanish schools in Andorra is not available. In 1954/55 there were 14 Spanish schools with 366 pupils.

Educational finance, 1958. Expenditure on education in French schools in 1958 (fiscal year beginning January) amounted to 20,595,425 French francs. This sum included 19,513,925 French francs for teachers' salaries and 1,081,500 French francs for other instructional expenditure. Of the total expenditure 16,357,037 French francs were spent for primary education and 4,238,388 French francs for secondary education. (Official exchange rate: 100 French francs = 0.238 U.S. dollar.)

No data are available on expenditure for Spanish schools.

ARGENTINA

THE EDUCATIONAL SYSTEM

Article 14 of the National Constitution adopted in 1853 lays down that all the inhabitants of the Argentine Republic shall enjoy the right to teach and to learn, in conformity with the legislation governing the exercise of that right. Likewise, under paragraph 16 of Article 67, Congress is empowered to lay down the curricula for general and university education.

The development of education in Argentina has been facilitated by the uniformity in ethnic and language conditions which has been specially marked since the second half of the ninteenth century. The great wave of immigration into the country up to the first world war was almost exclusively of European origin. Spaniards and Italians constituted the predominant nationalities and more than three-quarters of the Argentine population of today are descended from them. Practically no aboriginal communities remain in the country. Spanish is the language in general use.

Although the organization of education is simplified when the racial, linguistic and religious components of any culture are homogeneous, this homogeneity often leads to the establishment of uniform and set-type standards which rule out attention to many differentiating traits that also have their value. This is what has occurred in Argentina where one of the chief difficulties in education is to rid the curricula of a uniformity that does not correspond to reality. A growing concern to remodel the educational system by adjusting it to the particular conditions of each region and to the changing needs of national development may be observed at all three educational levels, primary, secondary and university.

Under the federal régime, the provinces and municipalities are empowered to establish schools and colleges within their respective jurisdictions, a right which has been widely exercised in so far as primary education is concerned. Each provincial government has an educational body, called the general education council (*consejo general de educación*) or the provincial directorate of schools. In the interior, many provincial establishments, apart from institutions under the Ministry of Education or the national universities, provide technical and vocational training and secondary school leaving certificate (*bachillerato*), commercial and teacher training courses. Most provincial secondary schools are of the technical or vocational type; this is due to the gradual industrialization of the country and to the fact that technical instruction was not so widespread as that for the *bachillerato* and teacher training.

As in the case of the primary level, the tendency is now to accord national recognition to diplomas and certificates conferred by the provincial schools; until recently their validity was restricted to the province concerned.

It should be pointed out that the number of pupils attending private secondary schools amounts to almost half the number enrolled in public institutions.

The structure of the school system may be seen in the diagram on page 183.

Primary education consists of six classes (*grados*) the

first of which is divided into lower and upper. Possession of the sixth class certificate is required for entry to secondary level institutions.

DEVELOPMENT OF SECONDARY EDUCATION

Perhaps the clearest way of dealing with this topic will be to take in turn the principal bodies which maintain schools: the Ministry of Education, other ministries, provincial and municipal authorities, universities and private bodies. With this administrative classification, an attempt will be made to describe the types of school, with relevant legislation, and the various forms of curricula and certificates.

Ministry of Education

The public and private secondary institutions under the Ministry of Education are organized and controlled by the following departments: Directorate-General of Secondary, Teacher, Special and Higher Education; Directorate-General of Private Education; Directorate-General of Education in the Arts; Directorate-General of Technical Education; Directorate-General of Physical Education.

Directorate-General of Secondary, Teacher, Special and Higher Education. The national secondary schools for boys (*colegios nacionales*), the secondary schools for girls (*liceos de señoritas*), the national and regional teacher training schools and the schools of commerce are subordinate to this Directorate-General. The main features of these institutions are described below.

General secondary schools. The national *colegios* were organized systematically by the decree of 14 March 1863. The courses of study offered by these institutions, as also by their feminine counterpart, the girls' *liceos* (first established in 1907), lead to the *bachillerato* certificate.

The curriculum first approved in 1863 has since been revised a number of times, and there have been innumerable proposals for further reform which have not been carried out. Most of the changes proposed or approved have related to the total period of study for the *bachillerato* certificate or its division into cycles or phases.

The most important was that adopted in 1941 which, with some partial amendments introduced subsequently, is still in force. This reform established the so-called basic cycle (*ciclo básico*) of 3 years, common to the *bachillerato* and teacher training courses alike. This cycle covers the following subjects: Spanish, one foreign language (English or French), mathematics, elementary physics and chemistry, biology, geography, history, democratic principles, drawing, music, and practical and physical education. The *bachillerato* requires a further 2 years, during which some of the subjects of the lower course are treated in greater detail and with some degree of specialization, and literature, philosophy, civics, and a second foreign language are added.

The *bachiller* certificate issued by the national *colegios* and girls' *liceos* qualifies for entrance to all university faculties.

Teacher training schools (*escuelas normales*) were established by a National Law of 1869. The curriculum was systematically re-planned in 1905 and remained in force for the 9 years until 1914 when substantial modifications were introduced. The teacher training course was of 4 years' duration from 1914 until 1941 when a further year was added. The first 3 years correspond to the general lower cycle for the *bachillerato* and the final 2 years qualify the student as a teacher. In addition to the intensified and specialized study of some subjects of the lower cycle, the following courses are given in the second teacher training cycle: pedagogy, general and special teaching methods, practice in teaching, the policy, legislation and organization of education, general history of education, general and applied psychology, philosophy, civics, language and literature, home economics (girls) or handwork (boys).

A demonstration section (*departamento de aplicación*) is attached to each teacher training school; it is designed to offer a full primary education in accordance with the curricula and programmes in force and to provide practical teaching experience for prospective teachers.

The teacher training schools confer the national teacher's diploma (*título de maestro normal nacional*) which qualifies for teaching in primary schools under the National Council of Education or those provincial authorities that accept it. (In practice all the provinces recognize the validity of this diploma.)

Regional teacher training schools, called 'rural teacher training schools' until 1932, were instituted by a Law of 1909. They train teachers for service in rural areas and accordingly their curricula include a number of subjects appropriate to living conditions that are not the same as in urban communities. Certain cultural and practical subjects of the lower teacher training cycle are modified and the following are added: dressmaking and cutting, cookery and homecrafts, weaving (girls); workshop instruction, agriculture, and rural building (boys); husbandry and farmwork (for both sexes). The second cycle also follows the general teacher training course. By reducing the hours of study in certain subjects, the following can be added: home economics and homecrafts; educational handwork; specialized farming; husbandry and processing of agricultural products; darning, washing and ironing; preparation of food for children, and dietetics; regional dyeing; weaving and pressing; husbandry and regional crafts (girls); rural building, carpentry and metalwork, specialized farming, husbandry and processing of agricultural products, topography; workshop instruction; husbandry and regional crafts (boys). The regional teacher's diploma (*maestro normal regional*) conferred by these schools qualifies for teaching in rural schools.

Training School for Language Teachers. The work of this school is based on a partial modification of the curriculum for the general teacher training schools. The difference consists in a reduction of the number of hours for certain subjects with a corresponding increase in the classes in the foreign language studied.

Language teacher training schools may be regarded as a preparatory stage for study at the Institute of Foreign Language Teachers, since the curricula for primary school teaching for which these schools provide the necessary qualifications do not include instruction in foreign languages.

Schools of commerce. National schools of commerce were instituted in 1891, when the first institution was

opened in the federal capital. At the present time schools of this type are governed by the plan approved in 1952, as amended in 1956. Two kinds of courses are given: day and evening. The day courses consist of a lower cycle of 3 years and an upper of 2 years. The lower cycle subjects are: Spanish, one foreign language (English or French), mathematics, elementary physics and chemistry, biology, geography, history, civics, democratic principles, music, typewriting, calligraphy and ornamental design, book-keeping, and physical education. In the second cycle there is greater intensification and specialization in some lower cycle subjects and the following are added: literature, physics, applied chemistry, general law and legal practice, commercial law, political economy, organization of trade and business, administrative law and fiscal legislation, and shorthand. The evening courses were instituted to enable persons employed in commerce during the day to attend classes. The subjects for the basic and second cycles are the same as for the day courses, the sole difference being in their distribution. The evening course takes 1 year more than the day course—4 years for the lower cycle and 2 for the second. Students who successfully complete the fourth year of the day course or the fifth year of the evening course are awarded a diploma in book-keeping (*tenedor de libros*); those passing out from the fifth year of the day course or the sixth year of the evening course receive the diploma of business expert (*perito mercantil*). The latter certificate is required for admission to the Faculty of Economic Sciences.

The Directorate-General of Secondary, Teacher, Special and Higher Education has made provision for students to transfer from one type of course to another in all schools, colleges and institutes under its control. In other words, any student following the *bachillerato*, teacher training or commercial school course may change his category with no loss in acquired grading; he may have to study a few elementary subjects in cases where there is a difference in any part of the lower cycles.

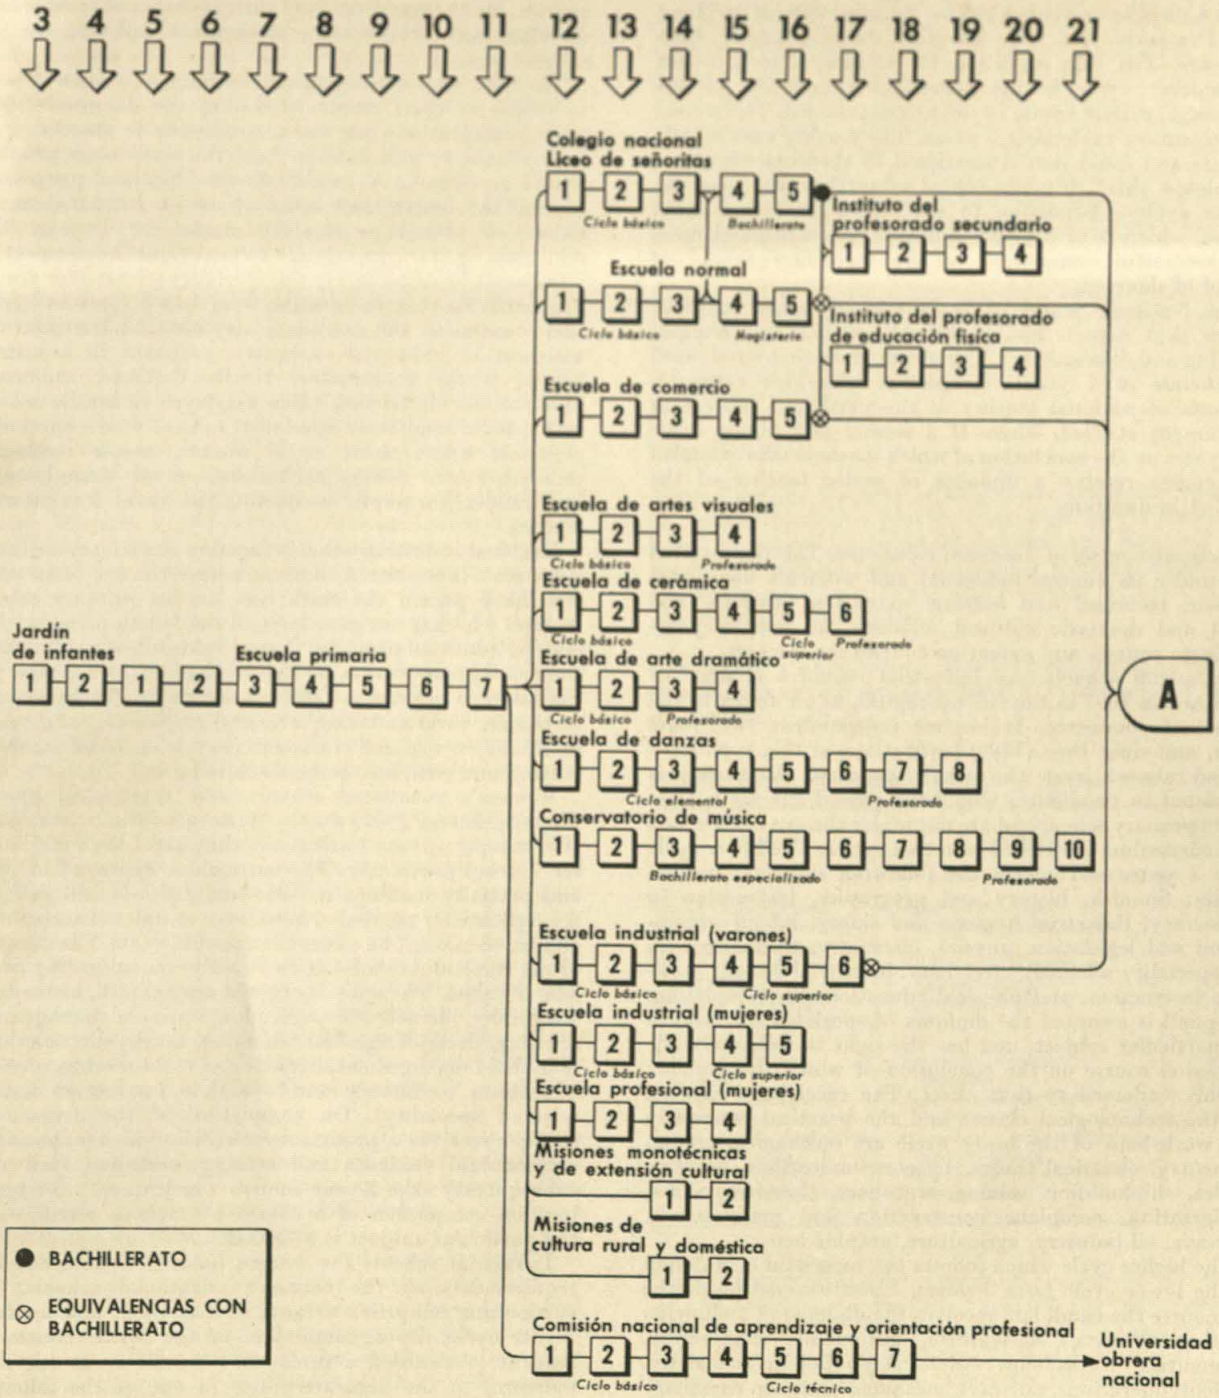
Many private educational establishments are connected with those of the Ministry of Education. They are governed by the plans and programmes of work approved for the public institutions subordinate to the Directorate-General of Secondary, Teacher, Special and Higher Education, with which they are incorporated.

Directorate-General of Education in the Arts. The Directorate-General was established as such in 1956, after functioning since 1948 as a department to which were subordinate a number of art institutes; many of the latter had started as private academies but gradually became official bodies after 1905. Education in the arts covers schools of visual arts, ceramics, dramatic art, dancing and music. Until 1958 these schools were conducted solely in the federal capital.

The National School of Visual Arts offers 4-year courses. One school in this category also provides a further 3-year cycle which prepares for the diploma of national professor of engraving or painting or sculpture; the holder of this qualification may teach in the preparatory or intermediate cycles of visual arts or teach drawing in secondary schools.

The National School of Ceramics gives instruction in both decorative and industrial ceramics. The curriculum comprises a basic cycle of 4 years, followed by a higher fifth-year course. The successful student may continue for a sixth year, at the end of which he receives the diploma of national ceramics teacher.

The National School of Dramatic Art was granted autonomy in 1957, before which date courses in dramatics had been given in the Dramatic Art Section of the National School of Music and Dramatic Art. At the end of the first three years the student is eligible for the certificate of actor, and on successful completion of the fourth year is awarded a diploma of national teacher of dramatic art.



The National School of Dancing was instituted by the Decree of 13 June 1951. Before that date, courses in classical dancing (from 1924) and in Argentine folk-dancing (from

GLOSSARY

bachillerato: upper cycle of general secondary course.
bachillerato especializado: specialized *bachillerato* course at vocational secondary school of music.
ciclo básico: lower or 'basic' cycle.
ciclo superior: upper cycle.
ciclo técnico: cycle of technical training.
colegio nacional: general secondary school for boys.
Comisión nacional de aprendizaje y orientación profesional: courses run by the National Commission for Apprenticeship and Vocational Guidance.
escuela de arte dramático: vocational and teacher training school of drama.
escuela de artes visuales: vocational and teacher training school of pictorial and plastic arts.
escuela de cerámica: vocational and teacher training school for ceramics.
escuela de comercio: vocational secondary school of commerce.
escuela de danzas: vocational and teacher training school of classical and national dancing.
escuela industrial (mujeres): girls' vocational training school for industrial trades.
escuela industrial (varones): boys' vocational training school for industrial trades.
escuela normal: teacher training school.
escuela primaria: primary school.
escuela profesional (mujeres): vocational training school for women's occupations.
instituto del profesorado en educación física: specialized training college for physical education teachers.
instituto de profesorado secundario: training college for secondary school teachers.
jardín de infantes (kindergarten): pre-primary school.
liceo de señoritas: general secondary school for girls.
magisterio: upper cycle (professional training) in teacher training school for primary teachers.
misiones de cultura rural y doméstica: itinerant schools providing courses in homecrafts and home economics and elementary general education for women in country districts.
misiones monotécnicas y de extensión cultural: itinerant schools providing courses in various industrial and agricultural trades and elementary general education for men in country districts.
profesorado: teacher training course.

1940) had been provided at the National School of Music and Dramatic Art. The classical dancing course lasts 10 years. The sole condition for admission to a 2-year preparatory cycle is the successful completion of the first stage (*primer grado*) in the primary school. The second or elementary cycle lasts 5 years. The teacher's cycle lasts 3 years and admission is restricted to students who have completed their primary school education and also the earlier cycles. Admission to the Argentine folk-dancing course, which is of 3 years' duration, is conditional upon the successful completion of the secondary school or school of dancing.

The National School of Music was so named in 1957: before that date it had contained sections in elocution, dancing and dramatic art. The courses include a specialized *bachillerato* of 7 years, completion of which carries a diploma of national teacher of the particular subject or instrument studied. There is a second and higher cycle of 3 years on the conclusion of which teachers who attended the course receive a diploma of senior teacher of the subject in question.

Directorate-General of Technical Education. This department has under its control industrial and women's vocational schools, technical and cultural extension missions, and rural and domestic cultural missions, as well as post-graduate courses and extension courses for workers.

Industrial schools. An industrial school was first established in 1897 in the federal capital, as an annex to the school of commerce. It became independent two years later, and since then (1899) institutions of this type have spread almost over the whole country. Admission is restricted to candidates who have passed the sixth class of the primary school and are not under the age of 12 years. The curriculum is divided into two cycles. The lower cycle lasts 3 years and covers the following subjects: mathematics, Spanish, history and geography, instruction in democracy, industrial hygiene and safety, labour organization and legislation, physics, chemistry, technology (in the speciality selected), electricity, industrial design, workshop instruction, and physical education. On completion, the pupil is awarded the diploma of specialist (*experto*) in his particular subject, and has the right to follow a trade extension course on the conclusion of which the diploma is duly endorsed to that effect. The specialities covered by the technological classes and the practical courses in the workshops of the lower cycle are mechanical trades, carpentry, electrical trades, telecommunications, building trades, shipbuilding, mining, transport, chemical trades, refrigeration, aeroplane construction and maintenance, railways, oil industry, agriculture, graphic arts.

The higher cycle which follows the successful completion of the lower cycle lasts 3 years. Upon completion of the full course the candidate receives the diploma of technician in the following: agriculture, automobile engineering, aeronautics, works supervision, shipbuilding, electricity, oil-fields operations, railways, mechanics, mining, chemistry and telecommunications. The technician's diploma qualifies for admission to faculties of engineering, technology, architecture and the exact sciences. Students completing the higher cycle may, like those finishing the lower cycle, go on to further specialization, by attending graduate courses. On the termination of their courses the technician's diploma may receive an endorsement referring to the subject studied.

The industrial schools provide evening extension courses to enable workers employed during the day to become more proficient in their work. Admission to these courses is restricted to persons who hold the sixth class primary school certificate. A candidate who has not progressed beyond the fourth class must sit for an entrance examination or attend preparatory classes for 1 year. The minimum age for admission is 16 years and the prospective pupil must be employed in the speciality selected for study. The curricula vary in duration from 1 to 3 years and upon their conclusion the candidate may obtain a certificate of assistant in industrial chemistry, assistant in industrial safety, works constructor, textile designer, radiocommunications electrician, office employee in textile works, orthopaedic appliances specialist, optical works specialist, electrical fitter, sheet metal worker, motor mechanic, radio-operator, mining technician, naval draughtsman, boatbuilder (for pupils completing the naval draughtsman course).

Regional industrial schools function in country districts. Admission is restricted to persons over the age of 12 years who have passed the sixth class in the primary school. A pupil who has not gone beyond the fourth primary class may be admitted provided that he takes a 2-year qualifying course. On completion of the curriculum of 3 years, the candidate is granted a skilled worker's certificate as rural mechanic, rural metalworker, rural carpenter, rural motor mechanic, or regional craftsman (boys); or in dressmaking, cutting and weaving, or homecrafts (girls).

Women's vocational schools were established by the Finance Act of 1901, on the pattern of the Santa Marta Workshops, private institutions that had been functioning for 7 years previously. The curriculum approved in 1950, and partially modified in 1953 and 1956, is still in force. A candidate for admission must have completed her primary education and not be under the age of 12 years. The duration of the curriculum varies from 1 to 4 years, according to the course taken. The subjects taught are Spanish, history and geography, democratic principles, business management, drawing, dress design and trimming, music, diet, clothing, household management, hygiene and child-rearing, physical education, technology and workshop instruction (in the selected speciality). On completion of the course, the student receives a proficiency certificate in her speciality.

Successful students and serving workshop staff may subsequently take 2-year courses which qualify for teaching; on completion of a course a teaching certificate in the particular subject is awarded.

Industrial schools for women have the same entrance requirements as the women's vocational schools. The curriculum comprises a lower 3-year cycle and a higher 2-year cycle. Upon completion of the 5-year course the student is awarded a proficiency certificate as specialist (*maestra*) in the decorative arts in one of the following subjects: engraving and metalwork, interior decoration, books and advertising, sculpture.

Itinerant mono-technical and cultural extension schools (*misiones monotécnicas y de extensión cultural*) were established under the Finance Act of 1947. They travel

from place to place in the underdeveloped areas inland and are exclusively for male pupils. The conditions for admission are the successful completion of the fourth primary class and a minimum age of 14 years. The course lasts 2 years and on its completion the student is awarded an elementary certificate in one of the following subjects: motor mechanics, carpentry, electrical trades, agricultural machinery, building, husbandry.

Itinerant rural cultural and domestic schools also function for temporary periods in interior areas. They are exclusively for women and the entrance requirements are the same as for the itinerant mono-technical schools. On completion of a 2-year course the pupil is awarded an elementary certificate in rural homecrafts.

Courses run by the National Commission for Apprenticeship and Vocational Guidance. The commission was established by Decree No. 14538 of 1944, which two years later was converted into Act No. 12921. It was subordinate to the Ministry of Labour and Welfare until 1951 when by Decree No. 1477 of the Executive Power it was transferred to the Ministry of Education. Although subordinate to this Ministry, the Commission is autonomous in administrative and financial matters. Its functions may be resumed as: supervision, control and direction of the work and apprenticeship of persons between the age of 14 and 18 years; organization of schools for minors in employment; organization of apprenticeship for non-employed minors; organization of extension courses for adults (according to trade and speciality); provision of higher technical education and training for the purpose of industrial management. The courses comprise 3 cycles—lower, technical and university.

The lower cycle lasts 3 years and consists of apprenticeship, half-time employment, and workers' qualification courses. The apprenticeship courses are for both boys and girls between the ages of 14 and 18 years, who have completed their primary education. Boys attend factory schools for two 4-hour periods and girls for one 4-hour period. Minors employed in industry must attend a half-time course which lasts 5 hours. Factory schools also offer pre-apprenticeship courses of 2 hours' duration for pupils who have completed the fourth, fifth or sixth class in the primary school. On the conclusion of the lower cycle the student is awarded a certificate of *experto* (or *experta*) in a wide range of trades.

The lower cycle also provides special courses in certain industrial occupations, preparatory courses for admission to qualification courses or for training in specified trades, and intensive courses to provide skilled labour to industrial undertakings on their application.

The technical cycle lasts 4 years and admission is subject to the successful completion of the lower cycle course in the trade selected. The courses are held in the evening and designed to train technical supervisory staff for industrial undertakings. On completing the cycle, the outgoing student is awarded a certificate of factory technician (*técnico de fábrica*) in any one of a number of trades.

There are also private factory schools, maintained by industrial undertakings where the instruction is supervised by the National Commission for Apprenticeship and Vocational Guidance.

The university cycle courses are held in the National Workers' University, which was established by Act No. 13339 of 1948. Admission is subject to completion of the technical cycle in a school of the National Commission for Apprenticeship and Vocational Guidance or of the Directorate-General of Technical Education. Attendance at classes is compulsory. The university controls faculties in the federal capital, Avellaneda, La Plata, Bahía Blanca, Santa Fe, Córdoba, Mendoza and Tucumán. The outgoing student is awarded a diploma of factory engineer (*ingeniero de fábrica*) in the trade chosen.

Courses run by the National Council for Minors. The council maintains a school of commerce and a college offering supplementary training in agriculture. Both institutions are situated in the interior of Buenos Aires province and are boarding schools.

Other Ministries

Apart from the Ministry of Education, other departments of national ministries provide instruction at the secondary level. In general these establishments give technical and vocational training, although teacher training, *bachillerato* and commercial courses are also provided by some of the provinces and universities.

Department of Agriculture. The following table shows the special courses and diplomas offered by the schools under its control.

DEPARTMENT OF AGRICULTURE: SCHOOLS AND COURSES

School	Diploma	Duration of course (in years)
School of Agriculture	Agricultural expert	4
School of Fruit-Growing and Wine-Making	Fruit-grower/wine-maker	4
School of Agriculture and Stock-Breeding	Specialist in forestry or sheep-raising	3
School of Agriculture, Stock-Breeding and Husbandry	Agricultural expert	4
School of Poultry-Breeding	Specialist in poultry-breeding	3
School of Agricultural Machinery	Agricultural machinery technician	2
School of Milk Production and Processing	Specialist in milk production and processing	3
Higher Institute of Farm house Management	Instructress in farm house management	1

Department of Transport. Organizes courses in its School for Workshop Apprentices, schools in diesel-electric engines, brakes, workshop mechanics, and theoretical and practical work for apprentices, Technical School of Theoretical and Practical Work, School for Technical Vocational Guidance, School of Telegraphy, and School for Transport Apprentices. These schools are distributed throughout different parts of the country. They award certificates in mechanics, welding, iron-work, electricity, sheet metal work and carpentry.

Department of Communications. Controls the Postal and Telecommunications Technical School, which grants certificates in telegraphy and radio-telegraphy; and the Technical School for State Telephone Apprentices which grants electrician's certificates for public or private telephone exchanges. Specialized technical courses are also provided, for proficiency certificates, as well as courses for electrician foremen for public telephone exchanges, and inspectors of private telephone exchanges, line construction and cable laying.

Department of Public Works. Conducts a school for sanitary engineering apprentices and a school for port and harbour construction apprentices.

Service Departments. Institutions run by the War Department include the military academies (*liceos militares*) the programme of work of which is equivalent to the *bachillerato* courses of the national *colegios;* a *colegio* which provides *bachillerato*, teacher training and commercial courses, with a boarding-school free of charge for soldiers' orphans; and a school of military engineering which confers the certificate of non-commissioned engineer. The Navy Department likewise has a Naval Academy and a secondary-level *colegio*, with a boarding-school free of charge for the orphans of naval personnel; both of these offer courses equivalent to the *bachillerato.* There is further a school of naval mechanics whose outgoing students receive the rank of chief petty officer. There is also a school for naval apprentices specializing in engineering, which awards the certificate of naval engineer. The Aeronautical Department conducts a school of aeronautics which confers a certificate of non-commissioned engineer; it also organizes courses for apprentice mechanics in the various air brigades. The National School of Civil Aviation issues qualifying certificates for certain branches of aviation.

Provinces and municipalities

The education authorities of the provinces and larger municipalities maintain a considerable number of schools at the secondary level, generally of the vocational and technical types. The full list of provinces having educational establishments is Buenos Aires, Catamarca, Córdoba, Corrientes, Chaco, Chubut, Entre Rios, La Rioja, Mendoza, Misiones, Neuquen, Rio Negro, Salta, San Juan, Santa Cruz, Santa Fe, Santiago del Estero, Tucumán. Of the municipalities, that of the city of Buenos Aires has the largest school programme.

By way of illustration, the example of the province of Buenos Aires may be given. The provincial directorate of higher, secondary and vocational education is responsible for many vocational and agricultural schools. Vocational school courses vary in length according to the qualifications laid down for the various trades. On passing out, a proficiency certificate is conferred in certain subjects (such as dressmaking, shorthand, typewriting, etc.) or a qualifying certificate in such subjects as mechanical drawing, radio-technology, etc. The course, duration and certificates obtainable in the schools specializing in agriculture are shown in the following table:

TYPES OF PROVINCIAL AGRICULTURAL SCHOOLS

Type and place of establishment	Certificate	Duration of course (in years)
Agrarian School (Rivera)	Skilled farm worker	3
School of Agriculture and Stock-Breeding (San Francisco de Bellocq)	Skilled agricultural worker	3
Rural Training school (Las Flores)	Skilled agricultural machinery worker	2
Stock-Breeding School (General Villegas)	Skilled worker in stock-breeding and milk processing	3
Dairy Farm School (Miramar)	Skilled dairy farm worker	3
Dairy Farm School (Alberti)	Skilled dairy farm worker	3

There is also in Colón a social agrarian workshop where practical instruction in the industrial production of brooms, feather-dusters, wicker-work articles, etc., is given, in courses lasting from 9 to 10 months.

An agrarian *bachillerato* course may be taken in higher or special schools. The curriculum consists of a 3-year lower cycle and a higher cycle of 2 years. On completing the lower cycle, the student may finish his training by spending 1 year in an establishment for various specialized trades. Outgoing students from the School of Agriculture (Carmen de Patagones) receive a certificate of skilled workman (*perito*) in fruit-growing and wine-making or in viticulture and oil production; and from the School of Fruit-Growing (Dolores) the certificate of *perito* in fruit-growing and processing; and from the School of Stock-Breeding (Coronel Vidal) the certificate of *perito* in stock-breeding and milk processing. The higher cycle is taken in the last-named school, leading to the agrarian *bachiller* diploma which qualifies for admission to the agronomic and veterinary faculties; or practical training may be completed in an experimental establishment, for the purpose of obtaining the certificate of agricultural expert (*agrotécnico*) at the end of one year. The Higher Agrarian School for Women (Tandil) confers the certificate of technical visitor in farmhouse management on completion of a compulsory 1-year residential course. In addition, temporary farmhouse management and technical courses are provided in various places throughout the province of Buenos Aires.

Universities

The national universities control many secondary-level establishments and institutes, differing in organization and methods. In some cases (*bachillerato* and teacher training courses, industrial and commercial schools), the curricula are designed to prepare for subsequent university study. Thus, for example, the curricula of the university national colleges generally cover 6 years and include an introduction to Latin. On the other hand, the primary aim of many institutes—in particular, those concerned with education in the arts—is to promote activity in their particular cultural sphere, in view of the fact that most of the institutes of this type are established in the federal capital.

Private institutions

As stated above, the number of students attending private institutions that are connected with the official schools amounts to one-half of the total enrolled in the latter. The number becomes substantially greater if account is taken of the immense contribution of private institutions that are not incorporated with state education although they are permitted, in some cases, to issue certificates of validity equal to those conferred by the secondary schools of the Ministry of Education.

The following are the private schools conducted by the Catholic Orders that issue officially-recognized secondary education certificates: Colegio del Salvador in the federal capital; Colegio de la Inmaculada Concepción in Santa Fe; Colegio San José in Esperanza (Santa Fe province); and the Bachillerato Humanista Moderno, which incorporates a number of institutions and is maintained by the Archbishop of Salta.

A type of institute now known as the people's university began in 1917. These establishments which are to be found throughout the country are not attached to the official educational establishments. Admission is subject to completion of primary schooling. The people's universities give instruction in a number of special subjects not taught in the official schools such as television, watch-making, custom-house broking, public auctioneering, taxation legislation, legal aids, etc. Where there is a lack of teachers with academic qualifications recourse is had to suitable persons with practical experience.

There are in addition other private institutions the character of which does not strictly conform to secondary level; for example, schools for journalists, librarians and social assistants. Courses in instrumental music and singing, shorthand, typewriting, radio and television, foreign languages, dressmaking and cutting, etc., do not qualify for the issue of recognized certificates, as the private institutions in which they are given do not meet the requisite conditions for incorporation with official *colegios*.

The English Culture Association of Argentina, the Argentine-North American Cultural Institute, the Alliance Française, the Italian Dante Alighieri Society, the Argentine-German Cultural Association, and other institutions maintained by foreign communities conduct courses in their respective languages.

Administration

The educational system is prescribed by the National and Provincial Constitutions. As regards national jurisdiction, although Article 67, paragraph 16, of the Constitution empowers Congress to organize 'general and university programmes of instruction', this function has in fact been generally carried out by the Executive Power, due to the lack of legislative regulations governing the intermediate cycle. Private establishments (under Acts No. 934 of 1878 and No. 14389 of 1954) function in affiliation with similar state institutions and come under the same system as regards instruction, inspection and organization. Act No. 13047 of 1947 contains standard provisions governing the relationship of private schools with the State. The Corporate Private Education Council, with mixed representation, interprets and applies these provisions.

Public education at the secondary level is free but not compulsory. Most institutions of secondary type come under the control of the Ministry of Education; the remainder are (in decreasing order) under private organization, the provinces, other national ministries and municipalities.

Under the Ministry of Education, school inspection is assigned to inspectorates-general, under the control of the various directorates of education. Inspectors are assigned to specific areas and carry out periodic visits to schools for the purpose of verifying the standard of teaching and level of attainment of the pupils, the operation of all school services, building and equipment needs, and other aspects of organized education. After each visit, the inspector makes a report, assessing the merits of the particular institution.

Finance. The funds for support of the secondary education cycle are provided from the national, provincial or municipal budget, as the case may be. These funds come from general revenue, special accounts (the apprenticeship tax, local resources, the earnings of workshops, legacies and gifts) and public loans. The greater part of the public education budget represents salaries of the teaching, technical and administrative staff, the remainder is divided between capital investment and miscellaneous costs. Private establishments attached to the official educational establishments receive a state grant equal to three-quarters of the minimum teaching staff salaries, provided that their own resources are shown to be inadequate, or equal to the total amount of the salaries where instruction is provided free. The sums allotted for school buildings and equipment were increased in 1957 by a special account constituted by a tax on the entrance charges to racecourses in the federal capital and its environs, the payment of a duty on the exhibition (up to 200,000 pesos) of foreign feature films, and a special tax equivalent to 15 per cent of the basic prices of admission to all cinemas throughout the country. The decree was converted into Act No. 14553 in 1958 and the benefits were extended to secondary education. As regards school equipment, assistance is provided by co-operative associations and by vocational schools out of the earnings of their workshops. Two-thirds of these proceeds are distributed in industrial schools among the pupils. The pupils are also eligible for scholarships for further training if in view of their economic circumstances they would otherwise be unable to pay.

Buildings and equipment. The Directorate of Architecture of the Ministry of Education undertakes the planning, construction, repair and extension of school buildings, in consultation with the responsible educational directorate-general or similar authority under the competent national ministry or provincial government. It has attempted to establish school 'patterns' or 'types' which will meet the characteristics and needs of each region. The Directorate-General of Administration has also standardized school furniture, instruments and equipment.

School welfare services. The National Directorate of School Health carries out the compulsory medical and dental examinations of schoolchildren in every educational cycle.

In addition many scholastic institutions have organized medical and dental clinics of their own, in collaboration with the competent co-operative associations, and these provide services free of charge to pupils. The National Commission for Apprenticeship and Vocational Guidance conducts a psycho-technical guidance institute and an employment service (*bolsa de trabajo*) for directing minors to suitable occupations in industry and commerce.

Authorization was given in 1957 for the establishment of students' co-operatives, membership in which is open to parents of schoolchildren, past students, school personnel and general co-operative members. These co-operatives collaborate in organizing and operating school dining halls and canteens in numerous schools where a double-shift or evening time-table is in operation.

The Ministry of Education's Directorate of Social Welfare (DOSME) is maintained by budget appropriations and contributions from the Ministry's teaching and administrative staff amounting to 1½ per cent of the salaries received. Benefits to members consist of social services, including medical and dental care, household supplies, and reductions for certain places of entertainment and holiday travel.

Training and status of teachers. Secondary level schools which train teachers for primary schools have been described above. Teachers for secondary schools are trained in the secondary school teachers' institutes, which come under the Directorate-General of Secondary, Teacher and Higher Education. Institutes of this kind exist in the federal capital, Paraná (Entre Rios province), Rosario (Santa Fe province), and the cities of Córdoba, Santiago del Estero, Catamarca, San Juan, Jujuy, and La Rioja. The curriculum lasts two years and concludes with the diploma of secondary school teacher (*profesór de enseñanza secundaria*) in the subject chosen. The Kindergarten Teachers' Institute (there are many kindergartens in the country) and the Domestic Science Teachers' Institute are also subordinate to this Directorate-General.

The Physical Education Teachers' Institute, under the control of the Directorate-General of Physical Education, organizes courses for men and women, who are awarded the diploma of physical education teacher.

The Teachers' Statute, the original draft of which was prepared by the Ministry of Education, became law in 1958 by Act No. 14473. The statute governs admission to and promotion and transfer within all sections of the teaching body. Teachers' representatives on the classification and disciplinary boards that function in each of the school districts into which the country is divided for this purpose are elected by a vote of the whole teaching body. The classification boards are responsible for classifying prospective teachers, fixing teaching hours, and promotion within schools up to the most senior administrative and inspectoral posts. For this purpose it submits lists of candidates in order of merit and appoints selection boards. Each candidate who presents himself is graded according to the total number of points allotted for his diploma, the average assessment of his work, his seniority and other merits. The board also deals with applications for transfer, exchange, re-admission, substitutes and temporary employment and decides on the availability of the staff. The disciplinary boards advise on the holding of disciplinary inquiries, rule on requests for the reopening of the proceedings, decide on applications for reconsideration of the case or appeals to a higher authority, apply and remove penalties and exercise disciplinary control in every sphere of teaching.

The Teachers' Statute fixes the salary scale applicable to each educational cycle (primary, intermediate and university). Monthly pay indexes are determined by adding together the salary allotted to the teaching grade and post, and seniority, local differential, overtime and family allowances. The Executive Power is required by law to fix annually the monetary value of index No. 1, taking account of fluctuations in cost of living. It also prescribes the conditions governing retirement; after 25 to 30 years of service, pension is at the rate of 82 per cent of serving salary; no age limit is applied.

The statute supports freedom to join in professional associations, promotes social assistance and guarantees the exercise of all political citizenship rights. Likewise, it facilitates further study and research work by professors and teachers, through the granting of scholarships; recipients continue to be paid their monthly salaries for the duration of the scholarship up to a maximum of one year. Ten years' active teaching service is required to become eligible for a scholarship.

TRENDS AND PROBLEMS

In every cycle of public and private education, there is ample evidence of the desire to bring the educational system more into line with the true needs of the country. The need for greater attention to technical training is being especially stressed at the secondary level, in view of the country's rapid progress towards industrialization, with the resulting demand for specialized staff to direct and man the factories.

There is a tendency to modify the *bachillerato* course by depriving it of its encyclopaedic character and emphasizing the practical training side. These two objects are generally accomplished by extending compulsory schooling so as to include the lower cycle and by instituting a second vocational cycle. Another matter of growing interest is the provision of education taking more into account the particular features and needs of the environment in which the school is situated. The application of uniform standards to certain subjects is advocated, giving to other subjects the flexibility needed in order to express the differences in character on which the cultural life of the various regions is founded.

As regards education in the arts, the conventional repertory of subjects traditionally covered by the term 'fine arts' should be extended to include many products of industry. It would be useful, further, to train pupils in other branches of this form of work such as diagrammatic representation, furniture design, glass-working, stage decoration, advertising, etc.

In technical education, efforts are being made to bring the existing school system and programme of studies into conformity with the present and future needs of industry. This purpose will be effectively achieved if there is closer

co-operation between business interests and the bodies responsible for technical education. It is proposed therefore to set up a unified executive body under the direction of state and business representatives, into which the existing Directorate-General of Technical Education of the Ministry of Education and the National Commission for Apprenticeship and Vocational Guidance will be merged.

There is a strong tendency for unrelated educational bodies in a district to work together and attempts are being made also to achieve more rational co-ordination among bodies under different jurisdictions, with the object of utilizing distinctive district features to the best advantage.

Lastly, there is unanimous agreement that there should be a more coherent and organic connexion between the three levels of instruction so as to achieve real continuity in education.

[*Text prepared by Professor Félix della Paolera and a subcommittee set up by the Argentine National Commission for Unesco, in August 1959.*]

STATISTICS

Population (mid-year 1958 estimate): 20,248,000.
Area: 1,072,748 square miles; 2,778,412 square kilometres.
Population density: 19 per square mile; 7 per square kilometre.

Summary of school statistics, 1953–57. In 1957, school enrolment (not including adult education) reached a total of 3.4 million pupils, representing 17 per cent of the total population. Of these pupils, 2 per cent were enrolled in kindergartens, 78 per cent in primary schools, 4 per cent in secondary schools, 8 per cent in vocational schools, 3 per cent in teacher training schools, 4.5 per cent in institutions of higher education, and 1.5 per cent in special education. The proportion of girls was 49 per cent in primary schools, 36 per cent in secondary schools, 41 per cent in vocational schools, 87 per cent in teacher training schools, and 28 per cent in higher education institutions. Women teachers made up 90 per cent of the staff in primary schools, 58 per cent in secondary schools, 46 per cent in vocational schools, 78 per cent in teacher training schools, and 49 per cent in the teacher training colleges. Average number of pupils per teacher was 23 in primary schools, but less than 10 in any of the categories of secondary school. Between 1953 and 1957, enrolment increased by 5 per cent in the kindergartens, 8 per cent in the primary schools, 25 per cent in the secondary and vocational schools together, 52 per cent in teacher training schools, and 22 per cent in higher education. (See Table 1.)

Enrolment trends in secondary education, 1930–57. Between 1930 and 1957, enrolment in general secondary schools increased four times and in teacher training schools five times. In vocational education, despite the lack of comparability in the data presented, there is no doubt that enrolment increased at a very rapid pace in the course of the 28 years covered in this review. While in 1930, vocational school enrolment was less than either of the other types of secondary education, by 1940 it had become the predominant type of secondary education, and in 1957, there were more pupils enrolled in vocational schools than in all the general and teacher training secondary schools put together. The rapid expansion of secondary education is shown by a quadrupling of the secondary enrolment ratio, which indicates that the average total enrolment for the period 1955–57 was equal to one-fourth of the estimated population 15–19 years old. (See Table 3.)

Examination results in secondary education, 1953–57. The number of teacher training certificates doubled between 1953 and 1957, and the diplomas of industrial and trade schools showed a 50 per cent increase. In other categories there was little change in the annual number of certificates granted. The proportion of girls receiving the various types of certificates varied from 12 per cent in the case of industrial school diplomas to over 90 per cent in the case of trade and craft school diplomas and of teacher training certificates. (See Table 2.)

Educational finance, 1959/60. For the fiscal year beginning in November 1959, the budget estimate for primary, secondary and university education amounted to 12,348 million pesos, distributed as follows: primary education, 4,627 million pesos (37.5 per cent); secondary education, 4,708 million pesos (38.1 per cent); university education, 3,013 million pesos (24.4 per cent). The average expenditure per inhabitant was about 600 pesos. (Official exchange rate: 100 pesos = approx. 1.20 U.S. dollars.)

1. Enrolment reported for vocational education is not consistent owing to the exclusion of some schools in several years. Vocational education has therefore not been included for calculating average total enrolment and the secondary enrolment ratios.

AUSTRALIA

THE EDUCATIONAL SYSTEM

Responsibility for the administration of education within the six Australian States is vested in the respective State Governments. The Education Acts passed by the State Parliaments towards the end of the last century establish, together with subsequent amendments, the statutory framework for the present system of free and compulsory education. The dates of the promulgation of these Legislation Acts are: Victoria 1872, Queensland 1875, South Australia 1878, New South Wales 1880, Tasmania 1893 and Western Australia 1893.

At the time of Federation in 1901, the Commonwealth accepted responsibility for the provision of education within the territories which it administers. In the Territory of Papua and New Guinea (which is made up of the Territory of Papua and the Trust Territory of New Guinea) and in the Trust Territory of Nauru, schools are administered by Education Departments established as part of the administration of the territories concerned. In the other territories,

schools are administered on behalf of the Commonwealth Government by one or other of the State Education Departments: in the Australian Capital Territory and Norfolk Island by the New South Wales Department of Education; in the Northern Territory by the South Australian Education Department; and in the Cocos Islands and Christmas Island by the Education Department of Western Australia. Special schools for aboriginal children in the Northern Territory are administered, however, by the Department of Welfare of the Northern Territory Administration.

Government primary and secondary schools in each of the States are administered by the one authority, the State Education Department, and no delegation of authority takes place in this respect to local government organizations. Government schools in 1957 enrolled at both primary and secondary levels approximately 76 per cent of the school population. The remaining 24 per cent of students attended schools conducted by the Roman Catholic Church (19 per cent), or by other religious denominations and private bodies (5 per cent). At the secondary level government schools catered for 70 per cent of the school population and non-government schools 30 per cent.

The continent of Australia is some 3 million square miles in area with a population concentrated mainly in the east and south-east regions. The majority of the 10 million inhabitants are of European (mainly British) descent, although small numbers of Australian aborigines live in the northern, western and central areas of the continent. English is spoken almost universally and although considerable numbers of foreign language speaking migrant children have arrived in Australia in recent years and commenced schooling with little knowledge of the language, it has not been considered necessary to make provision for special English tuition at school level. In Victoria a short language course for children of 8 years and upwards has, however, been made available by the Education Department.

Some important characteristics of Australian education have resulted from the uneven distribution of the population. The compulsory clauses of the State Education Acts require all children between prescribed ages and living within a prescribed distance from a school to attend a government school or some other recognized institution, or to receive regular and efficient instruction in the home. The need to provide educational facilities for children living in isolated regions has presented problems for each of the Education Departments. Some of the solutions adopted have been the development of one-teacher schools, schools of the air, special radio broadcasts, and education by correspondence.

Most non-government schools are controlled by, or affiliated with, the various religious denominations, particularly the Roman Catholic Church, which has established a comprehensive system of pre-primary, primary and secondary schools providing educational facilities for over 70 per cent of the students not attending government schools. Schools administered by other church bodies are not organized to form comprehensive systems of education. A few non-government schools, including some of the foremost, are undenominational and controlled by corporate bodies, and many small kindergartens and preparatory schools are also privately owned. Unlike the government schools, many Roman Catholic schools and most of the other non-government schools have facilities for boarders, especially at the secondary level.

The structure of the school system is shown in the diagram on page 195.

THE DEVELOPMENT OF SECONDARY EDUCATION

Secondary education began in Australia some 50 years after the founding of the colony of New South Wales in 1778. Although a number of government primary schools enrolling children up to the age of 14 years had been established during the early part of the nineteenth century, the education of children past the primary stage and the preparation of candidates for university matriculation was first undertaken by schools established on the English pattern by voluntary organizations and religious bodies. These drew their pupils mainly from the families of administrators, army officers, clergy and well-to-do merchants.

With the passage of the various Education Acts towards the close of the nineteenth century, legislative provision was made for the setting up of secondary schools by government authorities. In New South Wales, for example, the first government high schools were opened at Sydney, Bathurst and Goulburn in 1883. Initially, these schools charged fees but later it became possible to admit all students free of charge. By 1910, most States had established effective secondary schools systems consisting of high schools providing secondary instruction only, and superior or continuation schools formed by the addition of secondary classes to existing primary schools. At this time there were also nearly 40 non-government schools throughout the Commonwealth providing secondary instruction for approximately 6,000 students.

Within the next few years, the orientation of secondary education was considerably changed owing to the establishment of public examination boards in the States. These bodies, set up under statutory authority, consisted of representatives of State Education Departments, non-government schools and the universities. The scope and content of secondary courses thus began to reflect the influence of university requirements, especially the work in the later years of secondary school. These boards are still the public examining authorities in each of the States, and the great majority of university entrants qualify for matriculation through passes in examinations controlled by the boards. The establishments of the examining boards also had the effect of bringing more closely together the curricula and syllabuses of government and non-government schools, through personal contacts between boards members and the preparation of students for the same examinations.

The years following the 1914–18 war saw the establishment of teachers' colleges, the development of better selection and examination techniques, and the introduction of less academically biased courses for the benefit of students not proceeding to matriculation. In addition, during this period a great expansion in school building and in teacher recruitment took place. Although the depression years 1929–33 checked the rate of school building and teacher training, the subsequent growth of

secondary industries during the 1930's stimulated the development of pre-vocational education in post-primary schools.

Since 1945 the Australian secondary school system has successfully faced the many problems arising from the period of recovery from the war and the increases in enrolments resulting from the war-time rise in the birth rate and post-war increase in immigration. In 1948, for example, the number of government secondary school enrolments was 879,000, whereas in 1956 this figure had risen to 1,355,000. Parallel to this growth there has been a significant broadening of the content and variety of courses offered. Schools with a rural bias, for example, have been established in the various States and there has been a tendency towards decentralization in the administrative structure of government schools, for example, in the establishment of Area and Regional Directors in New South Wales and Queensland.

No mention has been made in this section of the history of vocational education, since such education is not generally provided through secondary schools. Pre-apprenticeship classes are held as a part of the secondary school curriculum in one State and certain certificate and trade courses are offered by technical colleges which might be classified as secondary vocational. The first, however, are taken concurrently with normal secondary classes and the second are generally commenced after some secondary schooling has been completed.

Legal basis

The State Education Acts, already referred to, form the legislative framework of the Australian secondary education system and provisions for compulsory education are contained in these Acts. In each State, children are legally required to begin their schooling at the age of 6 years, and the minimum school leaving age is 14 years (15 in New South Wales and 16 in Tasmania). In Queensland, secondary education commences at the average age of 14 years but in other States the average ages are 12 or 13. Thus in all States except Queensland the compulsory education clauses cover some years of secondary school. Schooling may be given in government schools (including correspondence and special schools), in non-government schools or by private tuition. Exemptions are granted in the case of severe mental or physical illness and in some cases of geographical isolation from school facilities. Usually, little difficulty is experienced in ensuring attendance since free tuition is available in government schools. There are, however, compulsory attendance officers employed to interview offending children or parents and their intervention is usually sufficient to make legal action unnecessary.

Administration

Each State system of education is highly centralized, matters of policy being the responsibility of the Minister for Education. The Minister, who is a member of the State Cabinet and responsible to the State Parliament for the administration of his Department, has available to him the advice of his departmental head—the Director or Director-General of Education—and in some cases of special committees constituted in an advisory capacity. Thus questions of policy or of future planning may first be brought up at a school or inspectorial level and passed to the Minister via his Department and Director. Where legislation is concerned, cabinet and parliamentary approval are necessary.

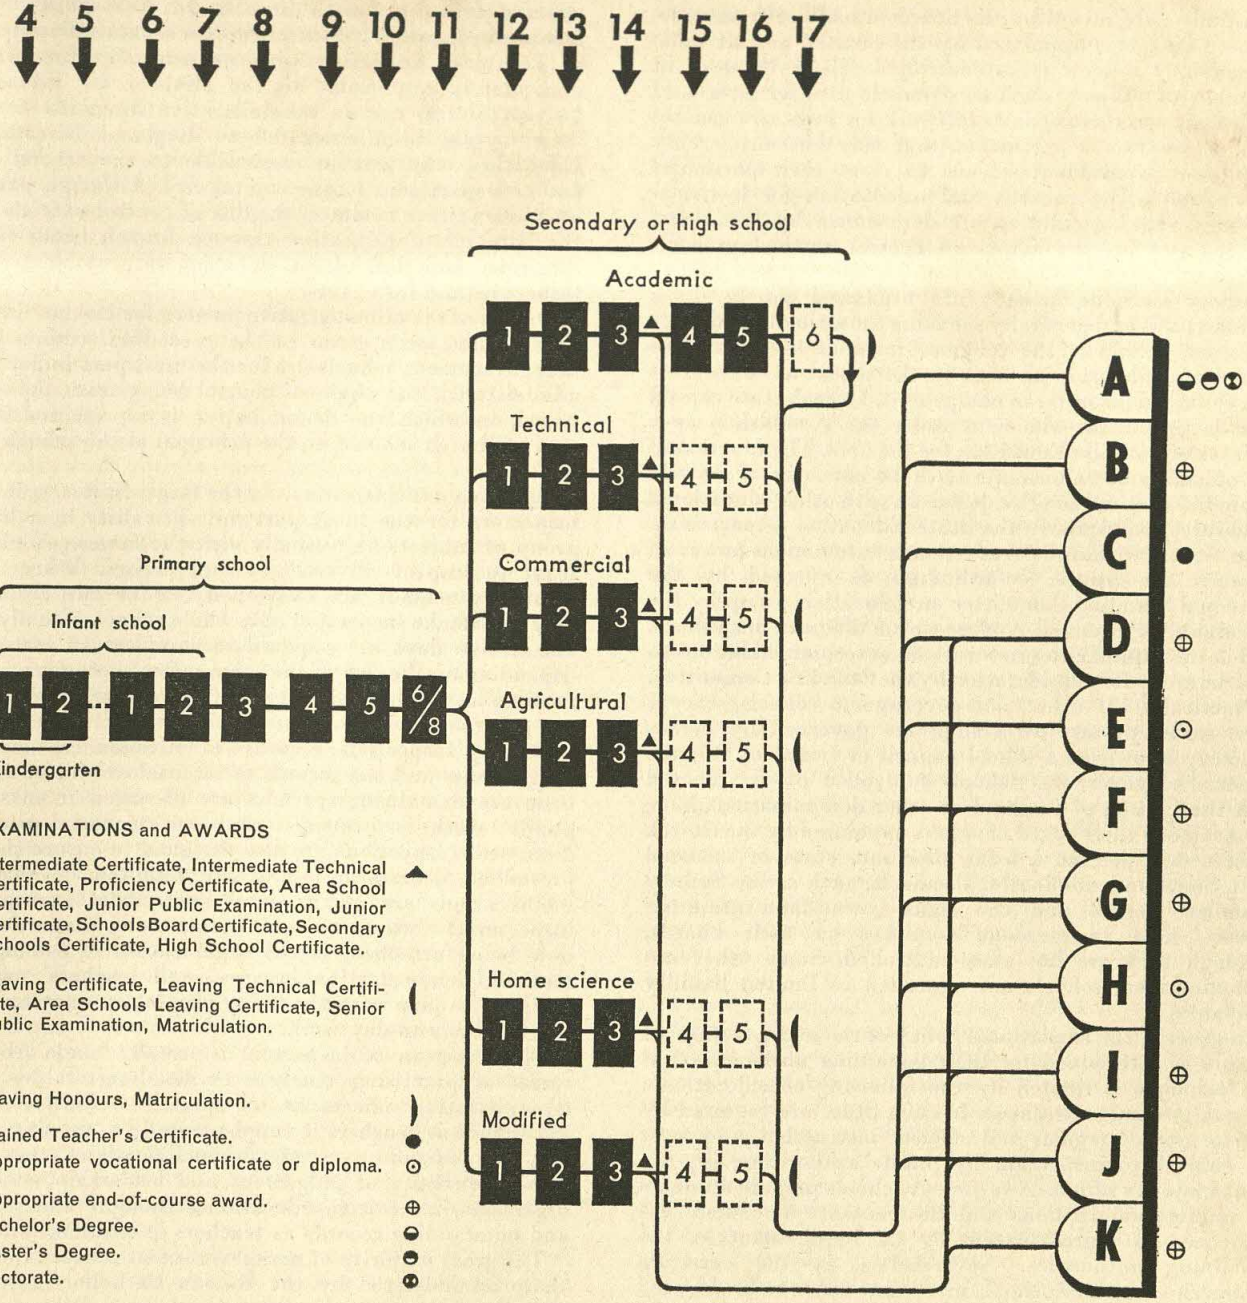
Questions affecting most syllabuses used in government secondary schools are not, however, independently determined at departmental or ministerial level. In each State, public examination boards have power to confer school leaving certificates and to draw up prescribed syllabuses for these. Membership of these boards is shared between representatives of State Education Departments, universities and non-government schools. In Western Australia, for example, the Public Examinations Board is made up of the Vice-Chancellor, the Professor of Education and seven other representatives of the University of Western Australia; the Director of Education and five other representatives of the Education Department; three representatives of non-government secondary schools for boys; and three representatives of non-government secondary schools for girls. It is rare for anyone outside educational circles to belong to any of the state examining authorities.

Although the scope and content of the majority of courses

GLOSSARY

NOTE. As school systems vary from State to State, this diagram is simplified. At the secondary level it shows types of courses available rather than types of schools.

infant school: school comprising pre-primary classes and the first two classes of the primary course.



kindergarten: pre-primary school.

primary school: duration of primary course proper varies from six to eight years according to the State.

secondary or high school: secondary school offering one or more of the various courses shown in the diagrams (*academic, technical, commercial, agricultural, home science, modified*). *Modified* includes 'local bias' courses in area schools and consolidated schools as well as the alternative curricula adopted in other high and secondary schools.

INSTITUTIONS AT POST-SECONDARY LEVEL

A. Universities.

are usually determined by the boards on advice from committees of experts appointed by the boards, not all work in secondary schools is so controlled. The syllabuses in a number of subjects such as domestic arts for girls, and woodwork, metalwork, and craftwork for boys, are usually prepared by the Departments, and may be considerably modified by individual schools to meet their particular needs. Again, the content and orientation for less academically minded children are determined by Education Departments on the advice of special curriculum committees.

Roman Catholic schools are organized partly on a diocesan basis and generally speaking the ultimate authority over each school is the religious head of the area. The control and direction of work in the school however rests with the religious order in charge of it. In each state capital there is an official who acts under the Archbishop as a Director of Catholic Education for the area. The function of this official is to co-ordinate Catholic educational matters within his area and to provide liaison with other educational authorities, particularly the State Education Department. Each diocese within the area remains autonomous however. Between the States, co-ordination is effected by the Episcopal Standing Committee on Education set up by the Hierarchy. A triennial conference of diocesan inspectors, held in the capital cities in turn, makes recommendations to the Hierarchy for consideration by the Standing Committee.

Practically all other non-government schools, except those under private ownership, are governed by bodies variously known as a school council or board of trustees or board of governors. Schools controlled by or affiliated with the Church of England or other denominations have all or some of their board members appointed by the church concerned, either at a local, diocesan, state or national level. Some undenominational schools, such as the Sydney Grammar School and the eight Queensland grammar schools, have government nominees on their boards, although they are not state-controlled. Some other undenominational schools are organized as limited liability companies.

In general, the educational policy of the non-government schools is determined by their governing authorities but this principle is limited by the following considerations: (a) non-government schools in each State are required by law to provide regular and efficient instruction, and most are subject to inspection by public authorities; (b) the great majority of non-government schools prepare students for public examinations and the contents of courses are influenced to a great extent by the requirements of the examining authorities. Nevertheless, in the curricula of church-controlled schools more time tends to be devoted to religious instruction than in the government schools. In addition, some of the non-denominational schools are known for their relatively adventurous approach to educational theory and practice.

Control. A State Education Department is usually divided into three main branches—primary education, secondary education and technical education—each supervised by a director, superintendent, chief inspector or similarly titled officer responsible to the Director of Education for the institutions under his control. In some States teacher training forms a fourth branch. In New South Wales technical education is controlled by a separate Department of Technical Education with its own Director, who is immediately responsible to the Minister for Education. In two States, certain administrative functions have in recent years been delegated to Regional Directors of Education, who remain responsible to the central Education Department in the capital city. Although patterns vary from State to State, the line of control extends from the Director of Education through branch heads (called directors, superintendents or chief inspectors) to staff inspectors and inspectors.

Details of the administrative pattern for Roman Catholic schools have been given in the preceding section. Other non-government schools are for the most part individually administered, the chain of control being from the school board, in which the denomination is represented in the case of church schools, to the principal of the school.

Supervision and inspection. In the larger States, secondary inspectors for the most part are specialists in a limited group of subjects and usually visit the larger schools as a team to inspect all teachers and classes. Where small secondary schools are concerned one or two inspectors may undertake inspection of a whole school. Usually from one to five days are required to complete an inspection, depending on the size of the school. Each secondary school receives an official visit once every two years, and at least one other supervisory visit.

During inspection records of attendance, teachers' programmes and the records of internal examinations and tests are examined; teachers are observed in class, the pupils' work is inspected and the teachers' problems discussed. Inspections are also designed to ensure that the prescribed courses of study are followed or that any modifications are along sound lines. Another aspect of inspectorial duties, to which increasing importance is now being attached, is the organization of seminars on method, demonstration lectures, and teachers' meetings designed to help with the many problems occurring in the teachers' day-to-day work.

The selection of inspectors is usually made from the ranks of practising teachers or headmasters by senior administrative officers or by special committees. Their experience as teachers is supplemented by training on the job. In addition to academic qualifications, they must possess qualities of judgement and leadership, ability as organizers, interest in educational thought and practice, and outstanding records as teachers or headmasters.

The great majority of non-government schools, including those administered by the Roman Catholic Church, are visited regularly by inspectors attached either to State Education Departments or to other bodies authorized for the purpose. In most States, such inspections are required by law. In others, schools are usually inspected at their own request in order to be approved for the instruction of children holding government scholarships or bursaries.

In addition to government inspections, Roman Catholic schools are inspected, usually annually, in either religious or secular subjects or both, by the diocesan inspector of schools or his equivalent. The only other school organization to have its own inspector is the Church of England in the

Diocese of Adelaide in South Australia where a representative of the Diocesan Board of Education visits and examines Church of England day schools.

Finance. Expenditure connected with the day-to-day administration of government schools, the payment of teachers' salaries, purchase of essential equipment, maintenance of school buildings, training of teachers, medical and dental services, travelling allowances and scholarships and bursaries for secondary education is met from the consolidated revenues of each State. There are no taxes or rates levied especially for educational purposes and neither in primary nor secondary government schools are students required to pay fees, except in Queensland secondary schools, and here an extensive system of state scholarships meets the cost of fees for most pupils. The Commonwealth Government is the only authority in Australia imposing income tax and from these collections it allocates each year to each State an amount known as taxation reimbursements. These are calculated mainly on a population basis, and along with the States' own business undertakings, are the major source of state revenue.

School building programmes are financed mainly from loan funds raised by the Commonwealth Government on behalf of the States, and the allocation of these funds among the States is determined by the Australian Loan Council, which consists of the Prime Minister of the Commonwealth and the Premier of each State or Ministers nominated by them in their stead.

Under the centralized systems of school administration, salary payments are made by cheque and forwarded direct to teachers by the Education Departments. In general, headmasters may make payments for minor repairs, services or equipment on their own initiative but other items of expenditure must be authorized by the central office of the Education Department.

The funds of Roman Catholic schools are derived from fees, parents' donations and allocations from church revenues. Parish schools do not charge fees although contributions are made by all who can afford them. Many of the larger Roman Catholic secondary schools, however, have a set scale of fees which are adhered to except in cases of hardship. Other non-government schools are maintained by fees and by income from property, bequests, etc. In Queensland, eight grammar schools receive a state subsidy, and in the Australian Capital Territory all approved non-government schools are eligible for Commonwealth assistance towards meeting interest payment on loans raised for building purposes.

Most Roman Catholic schools and some Church of England schools are staffed by teachers belonging to religious orders, and these teachers do not receive salaries, although the cost of their maintenance is met from church funds. Because of the large increase in school enrolments in recent years it has been necessary to train, employ and pay an increasing number of lay teachers, and the salaries of these, as in the case of other non-government teachers, are individually determined.

Financial assistance is available to parents through government scholarships and bursaries, taxation concessions and, up to the age of 16 years, child endowment allowances. In recent years, the Government of Victoria, for example, has made available over 4,000 scholarships per year to students at various secondary levels attending government and non-government schools; this total may be compared with the secondary school enrolment figure of 126,900 (1957) for that State. The majority of scholarships are tenable for two to four years and are intended to help parents meet the cost of maintaining children at school and purchasing school books and materials. In South Australia the majority of secondary students receive allowances during the first three years of secondary school. In addition, over 350 scholarships are made available each year in that State to students taking academic and technical courses beyond the third year of study. At the majority of non-government schools, privately endowed scholarships are awarded in varying numbers, and reductions in fees are normally made for children of the clergy or for two or more members of one family attending the same school. Parents may claim certain income tax deductions with respect to children receiving either government or non-government schooling, and in addition receive, irrespective of income, a government child endowment allowance on the basis of 5/- per week for the first child under 16 years and 10/- per week for each other child under 16 years.

Buildings and equipment. The provision of adequate school accommodation is one of the major problems now facing Australian education authorities. Since the war, both in government and non-government systems, there have been substantial shortages of buildings and equipment brought about by steep increases in the child population, and the tendency for pupils to remain longer at school. The impact of increased enrolments, which has been felt for a number of years at the primary level, is now (1959) affecting the secondary schools, and has led to extensive school building programmes, especially by government authorities and the Roman Catholic Church. Between 1949 and 1955 for example, annual loan fund expenditure by State Governments on secondary education facilities rose by over 600 per cent.

Various methods have been adopted by the State Education Departments to keep costs to a minimum and to secure the best use of available funds. Some States have tried out prefabricated schools and classrooms of various types—timber frame, aluminium, pre-cast concrete and steel—and have found them cheaper and easier to erect than brick buildings, and less affected by shortages of labour and materials. The standardization of these prefabricated buildings, and of the design of more conventional buildings, has also been an important factor in lowering costs and speeding construction.

In New South Wales, 600–800 is considered the maximum number of pupils a secondary school should accommodate, and all new, large schools are planned accordingly. In order to allow the fullest possible use of classroom and school equipment, about 24 classrooms are specified for each such school, each room ranging in size from 550 to 750 square feet. The larger rooms may accommodate from 40 to 48 pupils if necessary and special rooms are provided for science, manual training and home science subjects. Lighting, heating and sanitation specifications vary from State to State.

Planning and design of school buildings in all States is

carried out by the respective Public Works Departments, which, in consultation with the Education Departments concerned, prepare plans and specifications, invite tenders and supervise the actual erection of buildings.

School welfare service. Each of the State Education Departments has established school medical and dental services. The Victoria school medical service, for example, employed, in 1958, a staff of 31 doctors and 38 nurses, and the school dental service, 40 dentists and 45 dental attendants. In New South Wales, in addition to medical and dental officers, a small number of psychiatrists, ear specialists, psychologists, social workers and speech therapists are specially employed for diagnostic and remedial work with children.

Generally speaking, most children receive medical examinations at least three times during their school careers, including once or twice at secondary school. If any defects are found, parents are notified and advised to seek treatment, or in cases of hardship, free treatment is available. Most parents, however, receive assistance towards such expenses through membership of a government-subsidized medical insurance scheme. Where possible, a school nurse visits the homes of the parents to discuss the general health of the children examined or to determine whether recommended medical treatment has been effected.

Dental services in most States, owing to shortages of staff, have had to be confined to primary schools.

In New South Wales, five child guidance clinics, each staffed by a psychiatrist, a psychologist and social workers, are maintained in the Sydney metropolitan area. The clinics are designed to help children suffering from disorders of personality or behaviour or from psychoneuroses. One of the clinics deals exclusively with cases before the children's courts. Clinics are also maintained for children suffering from hearing or speech defects.

In all States, special schools and classes have been established by the Education Departments and by voluntary organizations for the education of children who, because of some social, physical or psychological handicap, cannot work to their best advantage in ordinary classes. Among groups specially catered for are delinquent, blind, deaf, crippled and backward children. Specially trained teachers staff these schools and classes, and the courses offered are adapted to the children's particular needs. Handicapped children who cannot attend these special schools and classes are often enrolled at a correspondence school.

Crippled children are catered for in hospital schools most of which are administered by the State Education Departments. If secondary courses are not provided by the school, pupils who have reached that stage usually receive tuition from the correspondence school. The education of the deaf is undertaken both in special schools and classes established by the Education Departments, the Roman Catholic Church and by voluntary organizations. Many of the schools are residential. Schools and classes for the blind function along similar lines to those for the deaf.

A scheme of accident insurance is in operation in every State whereby school children are insured against injury sustained at school, while engaged in a school activity or, subject to certain exclusions, travelling to or from school. In most States the schemes originated with the State Federation of Parents and Citizens Associations or the State Association of School Committees entering into an agreement with an assurance corporation. Approval of the scheme was given by the respective Ministers of Education. In Western Australia, the State Government Insurance Office introduced the Schoolchildren's Insurance Scheme according to the plan of the Federation of Parents and Citizens' Associations. In Queensland, the State Government called for tenders for the introduction of an accident insurance scheme for school pupils.

In the five States in which the School Pupils' Accident Insurance Plan underwritten by the assurance corporation is in operation, the annual premium is 5/-. The policy entitles the claimant to a maximum of £75 for medical expenses contingent upon an accident, and there is no limit to the number of claims which may be made in any one year. For a premium of 10/- (in Victoria £1) a schoolchild may be insured against accident for 24 hours per day.

In the remaining State, the scheme is substantially the same, but the maximum amount which may be claimed for any one accident is higher.

Guidance services are a part of the educational administration of every Australian State. Educational guidance is provided by specially selected and trained officers both at the head office of the Education Department in the capital city of each State and, by visiting officers, in the schools. In some States there are also a number of metropolitan and country guidance centres.

There are variations between the States in the programmes carried out by the guidance branches in relation to secondary schooling. In New South Wales, all children are tested in the later years of primary school for selection for secondary schools. In Tasmania, all children applying for entrance to a selective high school and the majority of children going on to a non-selective secondary school are tested in the final primary grade. In Western Australia, all children in metropolitan schools are tested in the final primary grade. In the other three States, pupils are tested on enrolment in secondary schools.

In each State provision is made by the Education Department for schoolchildren to receive clinical remedial treatment.

In the matter of vocational guidance, officers of the Education Departments work in co-operation with other appropriate State and Commonwealth Departments.

TYPES OF SECONDARY EDUCATION

With the exception of Queensland, where the average age at which pupils complete primary school coincides with the school-leaving age, almost all students in the various States continue their education after primary school at a government or non-government secondary school. A variety of courses is available including those which are designed to prepare students for the university, those which provide for the development of special interests and aptitudes and those which cater for students who are not likely to remain at school for the full length of the normal secondary course. Most non-government schools adopt a curriculum of the first type, although within the Roman Catholic system there are also home science, commercial and agricultural schools.

With the exception of pre-apprenticeship classes in one State, true vocational education is not given in secondary schools, the instruction in secondary schools and courses being directed in the main towards general education. Such 'technical' instruction as is given tends to be pre-vocational rather than vocational, although it is true that some students in commercial courses reach a standard of proficiency in shorthand and typing which is acceptable in the business world without further training in a business college or similar institution. A number of part-time trade courses and courses leading to a certificate may nevertheless be classified as secondary, although few students enter them without having previously spent some time in a secondary school.

Most students are 12 to 13 years of age (14 in Queensland) when they begin their secondary courses. If they complete a full secondary course, they will have reached the age of 17 or 18. They may then, if they have satisfied entrance requirements, pass on to courses at universities, technical colleges and teachers' colleges in preparation for entry to a profession. Many students leave school, however, with lower qualifications than a school leaving certificate or matriculation. Some of these enter employment immediately, others take part-time or full-time courses at agricultural colleges, or they commence training as nurses. In all States facilities are provided by the technical colleges and business colleges for such students to qualify for a school-leaving or matriculation qualification through day-time or evening study or by correspondence.

The school year in Australia begins at the end of January or early in February, and ends in mid-December. The long vacation is taken over the summer months of December and January, and the two short vacations, in May and August–September, divide the school year into three terms. All secondary schools provide full-time instruction only, with the exception that in some cases evening classes are conducted for people who have left school before qualifying for the school leaving examination. In general they observe a 5-day week and approximately a 6-hour day, which is usually divided, for the purposes of subject allocation, into seven or eight periods.

General secondary schools

In general terms, all government secondary education, whether provided in academic, technical, or other schools, aims at integrating students into their social and economic environment, helping them acquire mental skills, knowledge, and capacity for critical thought, assisting in the developing of their character and of physical, moral and mental well-being, and providing a sound educational basis for their future careers.

Non-government schools, however, assume additional responsibilities. Church schools, and to a lesser extent, other independent schools, take a special interest in the religious education of children. They are not bound, as are the government schools, to avoid sectarian issues in the religious instruction given and the existence of boarding facilities in many of them offers further opportunities for character training.

As mentioned above, each State Education Department has now established comprehensive educational guidance services to help students choose the type of secondary course best suited to their abilities. The results of psychological tests, considered in conjunction with the child's school record and the wishes of the parents determine the type of secondary education he or she will receive.

Each state system provides a variety of courses, each type being to a large extent flexible through the provision of a fairly wide choice of subjects. One of the most important types may be called an academic or general course, since it is designed principally to prepare students for university entrance. The principal subjects included are English, history, geography, mathematics, chemistry, physics, economics. In addition, most pupils study at least one foreign language, usually French, and the more able may take Latin as well. A few pupils commence a third language in their second year, German being the most common, although other ancient and modern languages are taught in some schools. In the junior years, at least, woodwork for boys and needlework for girls, art and music form part of the curriculum. In all years provision is made in the school time-tables for physical education and sport.

In addition to the academic type of course, Education Departments have provided alternative courses to suit children with other needs. These 'interest' courses are built around a core of subjects, usually consisting of English, mathematics, social studies (or history or geography) and one or more sciences. No more than one foreign language is studied. Technical or industrial courses for boys give a prominent place in the curriculum to woodwork, metal work and trade drawing, whereas technical or domestic courses for girls include cookery, needlework, domestic economy and other subjects relating to household management. Commercial courses are available in some States in which subjects such as book-keeping, business principles, shorthand and typing are studies in addition to the core subjects. Agricultural courses usually include such subjects as agriculture, horticulture, animal husbandry, farm economy and farm crafts.

Provided the core subjects are taken according to the same syllabuses as are used in academic courses, it is frequently possible for students taking these courses to qualify for the school leaving certificate or even for matriculation. In some States, however, separate syllabuses are used and the courses may not cover as long a period of years as the academic courses. In other States additional curricula have been drawn up to suit the large numbers of students who leave school by the end of the third or fourth year of secondary schooling. They consist in the main of English, social studies, general mathematics, general science, physical education and health, music, art and a variety of crafts, the syllabus content in each case being more suited to the ability of the child who is not academically inclined.

While in all States the headmasters are at liberty to adapt any course somewhat to take advantage of local interests and needs, in some country districts it is the headmaster's responsibility to develop a course which bears directly on the needs of the local community. Such courses are known as area school courses, consolidated school courses or the like.

In most schools internal examinations, i.e. set and marked by the school staff, are conducted two or three

times a year and reports on each child's progress are sent to his parents. In addition, at least twice during the period of secondary schooling, children taking appropriate courses sit for public examinations. For the most part these are set and marked externally, although some States have introduced a certain amount of accrediting in the lower examination. In four States students may qualify for matriculation by passing in appropriate subjects at the school leaving or senior examination. In Victoria and Tasmania, however, the matriculation examination is a separate examination. Students who have been following courses based on syllabuses other than those prescribed by the public examinations boards usually qualify for their special certificates by internal examination.

Secondary courses are provided, for the most part, in multilateral schools offering two or more courses. In some of the state capital cities, however, the older government schools provide one type of course only and, as has already been remarked, many non-government schools are also of this type. Some secondary schools provide courses for the full period of secondary schooling while others cater for only the first three or four years. It is usually possible, however, for a student who has been studying at a school of the latter type to transfer to one providing the full course if he wishes to continue his studies. Many secondary schools, especially those giving the short course, are attached to primary schools, or, if the numbers of pupils are too small to be classified as a school, secondary classes may be attached to primary schools. In areas of even lower population density, the number of secondary pupils may not be sufficient to form a class. In this case the pupils receive lessons from the correspondence school of the capital city and complete them under the supervision of the primary school teacher. Children who are too isolated to attend any school, children of itinerant parents and sick children may receive all their secondary schooling by correspondence, although an effort is made through the provision of boarding allowances and school buses to bring as many as possible within reach of class teaching and the benefits of specialist instruction, adequate equipment, the variety of subjects and the social education provided by schools of reasonable size.

For the most part the training of secondary teachers is carried out by the universities in close collaboration with the government-controlled teachers' colleges, although the Roman Catholic Church trains many of its own teachers and there are two other private teacher training institutions.

The majority of secondary teachers, especially those in government schools and Roman Catholic schools, have taken a course of professional teacher training. Some non-government schools, however, do not require the teachers they employ to possess formal teaching qualifications and these accept a university degree as a qualification.

Most teacher trainees are recruited from among those who have already qualified for matriculation although some students in secondary schools are awarded scholarships to assist them to complete their secondary education and begin training as teachers. In most cases those who wish to teach in secondary schools are required to undertake a 3 or 4-year course towards an appropriate university degree followed by a 1-year diploma course of education. This diploma course consists of lectures and seminars on subjects associated with educational theory and practice, study and methods and techniques appropriate to secondary school subjects and periods of practice teaching and observation of experienced teachers.

In some teachers' colleges special courses, usually two years in length, are provided for suitable students who have qualified for matriculation but have not obtained a university degree. These teachers are usually appointed to positions involving the teaching of junior secondary classes only.

Teachers of specialist subjects, such as music, art, manual arts, domestic science and commercial subjects receive from two to five years training at teachers' colleges, universities, technical colleges or conservatories of music. In some cases, where the specialist course is given at an institution other than a teachers' college, the final year is reserved for professional training.

On appointment, a secondary teacher is normally required to teach two or three subjects, usually those he has studied in the degree course.

Teachers in government secondary schools are public servants of the State in which they teach. Their salaries are determined either by a board set up specifically for this purpose, as in four States, or by a public service or general authority dealing with this question. As public servants they enjoy security of tenure and cannot be dismissed unless they are guilty of a criminal act, gross misdemeanour or incompetence. They receive annual increments in salary until the top of the salary range is reached and, when they are considered of sufficient ability and experience, whether men or women, they are eligible for promotion to positions of greater responsibility, such as subject master or deputy headmaster.

Vocational and technical schools

Vocational education in the strict sense of the term is not given in secondary schools. In one State, however, the pre-apprenticeship classes run in association with government secondary schools constitute a form of vocational education which might be regarded as secondary in standard. In all States technical colleges offer trade courses and courses leading to a certificate which may be similarly classified. A large number of these trade courses are tied to apprenticeship regulations governing such matters as the length of appenticeship, wages and conditions of employment and the technical education of apprentices. Specially appointed authorities usually supervise the administration of these regulations. The colleges provide technical instruction and with the exception of several in Victoria, are government controlled. Certificate courses are usually more advanced than trade courses and, in general, provide semi-professional training.

Minimum entrance requirements for trade courses vary from State to State. Since only in special circumstances may a student enrol in a trade course before he has reached the statutory school-leaving age, in every State except Queensland, where secondary education is not compulsory, the student will have completed some secondary schooling. The school intermediate or junior certificate (taken after three years at secondary school) is the highest entrance qualification required.

In New South Wales pre-apprenticeship classes are conducted at technical colleges in Sydney, Newcastle and Wollongong in association with government secondary schools. The boys selected for the classes must have had three years' secondary education and must be no more than 15½ years of age at the beginning of the year in which they enter the course so that they will not be over age for entering into an apprenticeship at its conclusion. They receive full-time day instruction partly at the schools and partly at the technical colleges. The school subjects are English, mathematics, history or social studies, physical education and sometimes physics, while the college subjects, occupying at least 18 hours per week, are workshop practice, trade calculations, trade theory and trade drawing appropriate to the course the boy wishes to follow when he enters into an apprenticeship. Successful completion of the course gains him exemption from the first year of the trade course taken during apprenticeship.

Although the pattern of trade and certificate courses differs from State to State, they are similar in some important respects. The courses offered by Sydney Technical College may therefore be taken as an example with regard to the fields covered. Here, trade courses are offered in building, electrical trades, shoemaking, printing, hairdressing, mechanical and automotive trades, fitting and machining, plumbing, shipbuilding and similar trades. The automotive engineering trade course, for example, is of 4 years' duration with 6 hours each week spent studying such subjects as automotive theory and practice, fitting and machining, automotive drawing, calculations, trade science and oxywelding. In the building trades the courses available include bricklaying, carpentry and joinery, painting and decorating and plastering. The bricklaying course is of 4 years' duration, 6 hours per week, and comprises practical work, trade theory and calculations, trade drawing and construction theory and drawing. Instruction is given in the employer's time on one day (8 hours) per fortnight and in the student's own time on one evening (2 hours) per week. To qualify for the award of trade certificates in these and other trade courses, students must fulfil requirements regarding practical experience, as well as satisfactorily completing the prescribed course of study.

Certificate courses are provided by the college in such fields as agriculture, accountancy, electrical engineering, chemistry, biology, wool classing, textiles and electronics and communications. The accountancy certificate course for example is normally held over 4 years with instruction given for an average of 8 hours per week. The subjects studied include English, commercial law, bankruptcy law, company law and taxation law, monetary theory, auditing, management accounting and various aspects of bookkeeping. Entrance requirements in general are the secondary intermediate certificate or its equivalent. On satisfactory completion of the course students are granted exemptions from the examinations of such professional bodies as the Australian Society of Accountants and the Public Accountants' Registration Board.

In general, teachers of trade subjects in technical colleges are recruited from among qualified and experienced tradesmen, and after appointment they usually receive instruction in classroom teaching techniques. In one State, technical college teachers receive in-service professional training for one full day per week over a period of 1 year. A technical teachers' college has been established in Victoria.

Teacher training schools

There are no teacher training institutions at the secondary level in Australia. Teacher trainees, irrespective of the level at which they intend to teach, are required to have completed a full secondary course before commencing training.

Other specialized schools

In two States secondary schools are attached to the conservatory of music in the capital city and provide a secondary curriculum for students with special aptitude in music. The curriculum of one of the conservatory high schools, for example, includes English, history, mathematics, art, French and geography in addition to special study in music. In the few cases where choir schools are attached to cathedrals, a similar curriculum is followed. In all States many secondary school pupils supplement the musical education received during school hours with tuition from private teachers or teachers on the staffs of the conservatoriums of music.

Smaller numbers of students extend their study of art through individual or class tuition at technical college art classes or with private tutors.

Out-of-class activities

In most secondary schools, both government and non-government, pupils are given some measure of responsibility for the administration of school affairs. The scope of their activities and the system whereby they share them with the staff depend on the view of the principal and staff of the individual school. Most schools, however, have some positions of leadership for senior pupils, such as school captain, house captain, prefect, or the like, and in some schools a representative school council is made up of pupils from all sections of the school. The responsibilities of captains, prefects or councillors usually involve such duties as maintaining the standard of out-of-class behaviour, representing the school on civic occasions, acting as host or hostess to visitors to the school, etc. Students may be chosen for such positions by the school staff, elected by the pupils or appointed by some combination of staff choice and pupil election.

Democratic election procedures are most frequently adopted in the selection of class leaders, or in the appointment of office bearers for out-of-class clubs.

Most schools have a variety of clubs, catering for the interests of the pupils. The most popular are the school choirs, dramatic clubs, social service clubs such as the Junior Red Cross, and library, gardening, chess, stamps, and debating clubs. Worthy of special mention are the Junior Farmers' Clubs associated with country schools and which admit members up to 25 years of age.

Sport is encouraged in both government and non-government schools and most schools have one or more teams participating regularly in inter-school matches. The most popular sports are cricket, swimming, football, tennis, hockey, athletics, basketball and softball.

Some State Education Departments have a programme of school camps under which arrangements are made for classes to spend from a few days to a fortnight at one of the Department's camp sites. The programme at the camps includes physical education, bush walking, nature study, handcrafts and instruction in personal and community hygiene. In general, the aims of the camping programmes are to provide experiences in social living, to stimulate leisure interests and to extend the schools' health education programmes.

TRENDS AND PROBLEMS

In recent years the content and organization of secondary education has been under review in four States.

In Tasmania, following recommendations made by the Tasmanian Director of Education after his study of secondary education overseas in 1955, a number of experiments have been conducted on the provision of secondary education on a multilateral or comprehensive basis instead of the unilateral basis which had previously prevailed. Four district high schools were established, each conducting both the high schools (academic) course and the secondary schools (modified) course. Comprehensive schools began in 1957 with the comprehensive intake of first-year pupils into three area schools, in which they would all follow a course similar to the high schools course for the first year, but with increased specialization and differentiation in later years.

In New South Wales a committee appointed by the Minister for Education to survey secondary education presented its report in 1957. This committee, the University of Sydney, the Teachers' Federation and non-government schools, also recommended that secondary schools should be comprehensive, providing a core of subjects (English, social studies, science, mathematics, music, art, crafts, physical and health education, religious education) with a progressive increase in the proportion of elective subjects. By the fourth year the core subjects for many pupils would occupy about 60 per cent of the total school time, the remaining 40 per cent being spent on about three elective subjects. It was also recommended that the secondary school course should be extended to six years instead of five and public examinations held at the end of the fourth and sixth years instead of at the end of the third and fifth years. By this means it was hoped that more pupils would be encouraged to remain at school until the end of the fourth year and that students entering university would be better equipped, both in maturity and in background of study, for the courses they undertook. The committee tended towards the view that government schools should in future enrol both boys and girls, but no definite recommendation on the adoption of co-education was made. Although it may take some years before all these recommendations can be fully implemented, a first step towards the establishment of comprehensive schools has been taken in the conversion of many unilateral schools into multilateral schools.

In Western Australia a special committee was set up in 1958 to examine the adequacy of the secondary schools curriculum to meet the changing requirements of modern Western Australian life and the needs of all pupils, whether intellectually gifted or not. The committee consisted of 30 representatives from business and community organizations, the Teachers' Union, the University of Western Australia, churches, private schools and the Western Australian Education Department. In its interim report, recommendations were grouped under five headings: health and physical education; intellectual development and the basic skills; personal and group relationships; responsibility for moral choices; environmental factors and forces. Further work is being carried out in translating the recommendations into school syllabuses.

In 1958 also, a committee of six from the Victorian Education Department and the Australian Council for Educational Research was established by the Minister for Education to survey the Victorian education system generally. The terms of reference for the survey are principally the investigation of the present educational position and analysis of the problems facing the present system.

STATISTICS

Population (mid-year 1958 estimate): 9,846,000.[1]
Area: 2,974,583 square miles; 7,704,159 square kilometres.
Population density: 3 per square mile; 1 per square kilometre.

Summary of school statistics, 1953–57. In 1957 there were some 2,000,000 students enrolled in educational institutions from primary to university level, representing over 20 per cent of the population. There were in addition some 12,000 students attending adult education courses. Of total school enrolment about 71 per cent was in primary schools, 23 per cent in general secondary schools, 3 per cent in technical colleges, and the remaining 3 per cent in universities and post secondary teacher training institutions. Girls represented about half the enrolment at primary and general secondary levels and 62 per cent of teacher training enrolment, but only 21 per cent at universities. In primary schools 61 per cent of teachers were women and in secondary schools 43 per cent. Between 1953 and 1957 enrolment increased by 20 per cent in primary schools, 35 per cent in general secondary schools, 12 per cent in technical colleges, 54 per cent in teacher training courses, and 28 per cent in the universities. In 1957 the average pupil-teacher ratio was 32 in primary and 25 in general secondary schools. (See Table 2.)

Enrolment trends in secondary education, 1930–57. Table 3 shows the development since 1930 of general secondary school enrolment. Data for enrolment in vocational secondary schools are not complete for all years. Teacher training is generally at the third (higher) level and is thus excluded from this table.

Enrolment in general secondary schools more than tripled from 1930 to 1957. The average ratio of general secondary enrolment to total estimated population aged 15–19 years was 65 in the three-year period 1955–57, compared with an average ratio of 25 in the period 1930–34.

Examination results in secondary education, 1953–57. Some 19,290 students successfully sat for the secondary school leaving certificate in 1957/58 compared with 12,130 in 1953/54, an increase of 59 per cent. The number of girls obtaining the certificate rose from 5,340 to 8,400 over the same period and represented about 44 per cent of the total certificates granted in each year.

Educational finance, 1956/57. Total expenditure on education in Australia and the dependent territories in 1956/57 (fiscal year beginning July) was 129,764,000 Australian pounds, representing £11.4 per inhabitant in Australia, Norfolk Island, New Guinea, Nauru and Papua and approximately 2.8 per cent of the estimated national income for Australia in 1957. Of the total spent, 16 per cent was for capital expenditure. Recurring expenditure was distributed as follows: administration 3.1 per cent, instructional expenditures including salaries 85.4 per cent, other recurring expenditure 11.5 per cent. (See Table 1.)

1. Information on pre-primary institutions is available only for 1955, when 767 schools, public and private, enrolled 34,147 pupils.
2. Including special schools and classes. All public schools with primary pupils are classified as primary schools, and all public schools with secondary pupils are classified as secondary schools. Private primary schools are estimated on number of pupils in primary classes, and private secondary schools on number of pupils in secondary classes.
3. Excluding private vocational schools.
4. Including data on post-secondary courses (diploma courses).
5. Part-time students enrolled in trades courses.
6. In addition, there is some teacher training conducted by private organizations, such as religious seminaries.
7. Including students undertaking university courses as part of their training. These are included also under higher general education.
8. Including data on secondary vocational education in technical colleges.
9. Not including university tutorial classes, adult education board classes and discussion groups, nor classes of the Workers' Educational Association.
10. Not including Metropolitan lecture classes.
11. Not including university tutorial classes, classes of the Workers' Educational Association, Council of Adult Education groups, nor university tutorial 'kits' and discussion groups.

NAURU

Trust Territory

THE EDUCATIONAL SYSTEM

The administration of Nauru is vested in an Administrator, who is responsible to the Australian Government through the Minister of State for Territories. An advisory body, the Nauru Local Government Council, advises and assists the Administrator. An Educational Advisory Committee acts as a liaison body between the Council and the Education Department on educational matters.

Under the Compulsory Education Ordinance 1921/1951, the Administrator controls education and is empowered to make rules, regulations and orders for the conducting and maintenance of schools.

Education is free and compulsory for all children from the age of 6 years to 15 years in the case of European children and to 16 years (extendible for a further 12 months) in the case of Nauruan children. In consequence almost all children completing their primary education proceed to secondary schooling.

The school system is designed to provide effective education for all the children in the Territory. The population includes large European, Chinese, and Gilbert and Ellice Islands immigrant groups in addition to the Nauruans and the fundamental differences in languages and in educational and social background of the children make it necessary to provide different types of schools at the primary level. This differentiation, however, is solely on educational and cultural grounds, and the schools for

Nauruans for example also include some pupils from each of the immigrant groups.

Private agencies may conduct schools, subject to regulations governing such matters as the qualifications of teachers and the standards of instruction.

THE DEVELOPMENT OF SECONDARY EDUCATION

Compulsory education for Nauruans up to the age of 16 years was introduced in 1921 as one of the earliest Acts of the Australian administration, and in 1925 provision was made for a further 12 months of part-time compulsory education. For girls, secondary schooling had a strong bias to domestic arts and to instruction in Nauruan crafts. For boys there was a 3-year general cultural and junior technical course, followed by 3 years of full-time technical education. A few Nauruan youths were also sent to Australia for secondary education or for higher training.

During the war and enemy occupation, education of Nauruans was dislocated and it was not until 1952 that a secondary school was re-established on the Island. From 1948, however, scholarships for secondary education in Australia were awarded to promising Nauruan students.

In 1954, the new secondary school building was erected. This school is well equipped for both general education and domestic arts and technical instruction. The school takes pupils through the first 4 years of the secondary course of the Australian State of Victoria. The Roman Catholic Mission of the Sacred Heart now also offers the same 4-year secondary course at its school.

Administration

The Department of Education determines the outlines of secondary education for Nauru. Syllabuses and examinations are those used in the State of Victoria and arrangements are made with the Victorian Department of Education for the conducting of courses, examinations and similar matters.

Although local adaptation is restricted because of the links with the Victorian examination system, some modifications are made to meet local needs. This applies particularly to the teaching of English which is not the mother tongue of the Nauruan children. The Education Committee of the Nauru Local Government Council may assist in an advisory capacity in the development of policy and planning.

The Administration secondary school is controlled directly by the Department of Education and the headmaster is an officer of that Department. The only other school with secondary classes is conducted by the Sacred Heart Mission and is inspected regularly to ensure that proper standards are maintained. Inspection and supervision of all schools are carried out by trained officers of the Department of Education as part of their normal duties.

The Administration meets all the costs of the Nauru Secondary School including buildings, equipment, supplies and teachers' salaries. No fees are charged at this school. The Sacred Heart Mission meets all the costs of conducting its secondary classes, but is assisted by the Administration in the provision of school supplies. Parents are assisted through the provision of scholarships for secondary education and for various forms of training overseas.

There are no specific school welfare services except regular medical and dental attention. Any problems of either parents or pupils are dealt with as they arise by officers of the Administration.

TYPES OF SECONDARY EDUCATION

The secondary education available on Nauru is of a general nature and includes provision for the study of technical, commercial, and domestic arts. For scholarship holders sent to Australia the types of courses to be undertaken are determined by the Director of Education, in accordance with the pupils' interests and abilities and the wishes of the parents. Privately sponsored students going to Australia are advised on courses available. Nauruan students in Australia receive careful guidance from the Department of Territories and the Commonwealth Office of Education.

Most students who want further education must go overseas. The Administration provides scholarships and cadetships for post-secondary education and training at the Central Medical School and the Central Nursing School at Suva, Fiji, and in Australia. In Nauru itself service training is provided in appropriate fields within the Administration, particularly through part-time classes, and the British Phosphate Commissioners have a form of apprenticeship training.

Since the secondary schools in Nauru follow Australian syllabuses and present students for Australian public examinations, they adopt a pattern of organization very close to that of Australian schools and have similar terms, school days and holidays.

General secondary schools

The secondary schools in Nauru aim to provide a general education which will raise educational levels, encourage good citizenship and, while fostering traditional crafts and activities, enable each student to undertake whatever further secondary education or training he may be fitted for.

The only qualification required of students for entry into secondary schools is completion of their primary education. The degree of differentiation within the schools is limited because of the small numbers of pupils involved; at the Administration secondary school students attempt either the Intermediate Technical Certificate or the academic Intermediate Certificate according to their interests and abilities.

The subjects taught at the Administration secondary school are English, arithmetic, algebra, geometry, social studies, history, general science and hygiene. Boys are instructed in woodwork, metal work, mechanical drawing and in such Nauruan skills and crafts as canoe making. Girls are instructed in cooking, nutrition, household management, needlework, and in the preparation of various local materials and in the making of mats, baskets, fans and belts. The course for the Junior Technical Certificate takes 3 years and the Intermediate Technical Certificate and the Intermediate Certificate 4 years.

Teaching methods are generally the same as those used in Australia. Special methods, however, have been devised for the teaching of English. All teachers in the secondary schools in Nauru have been trained in Australia in secondary teaching. At the Administration secondary school two of the teachers, including one Nauruan woman, have been trained as specialized domestic arts teachers.

Vocational and technical schools

The British Phosphate Commissioners provide evening classes in appropriate practical subjects for apprentices, who also attend weekly classes in English and trade mathematics conducted by the Department of Education.

TRENDS AND PROBLEMS

The educational policy for Nauru is one of advancing the Nauruan people as rapidly as possible, with a view to their taking an increasing share of the management of their own affairs. This requires, in the case of secondary education, a broad basis from which students can proceed to the appropriate specialized training.

There is, concurrently, a need to provide for sound primary education as a basis for secondary education. The special concentration in the past few years on the improvement of the primary curriculum and on the development of special methods of teaching English has led to steady improvement at all levels of education and training.

Secondary enrolments are at present low on account of factors associated with the war. The higher birth rate of the post-war years, however, will lead to a rapid increase in secondary enrolment. The Administration secondary school, with an enrolment of 49 at 1958, has accommodation and facilities which would be adequate for 250 secondary pupils, and as enrolments increase a wider range of subjects will be made available. Nevertheless the population of the Island is small and it will be necessary to continue to rely on Australian facilities for higher secondary levels.

[*Text prepared by the Department of Territories, Canberra, in June 1959.*]

STATISTICS

Population (mid-year 1958 estimate): 4,000.
Area: 8 square miles; 21 square kilometres.
Density: 500 per square mile; 190 per square kilometre.

Summary of school statistics, 1953–57. From 1953 to 1957 total enrolment in primary and secondary schools increased by 25 per cent. In the latter year 45 per cent of the pupils were girls. The number of pupils per teacher in primary schools was 23 in 1957 as against 19 in 1953. (See Table 2.)

Educational finance, 1957/58. In the fiscal year beginning 1 July 1957, the Commonwealth Government spent 44,938 Australian pounds on education in Nauru. Salaries to teachers represented 45 per cent of the total and capital expenditure 21 per cent. The average expenditure per inhabitant was £11 for 1957/58 as compared with £7 for 1945/55. (See Table 1.)

NEW GUINEA

Trust Territory

THE EDUCATION SYSTEM

The Trust Territory of New Guinea and the Territory of Papua were constituted an administrative union designated as the Territory of Papua and New Guinea, under the Papua-New Guinea Act, 1949–57. Education in both territories is administered as a single programme, and the information provided here (with the exception of the statistics, which are available separately for New Guinea and for Papua) applies equally to Papua.

The chief legislation is the Education Ordinance 1952–57, which provides that the overall control and direction of secular education is the responsibility of the Administration. The Native Apprenticeship Ordinance 1951–55 makes provision for apprenticeship training and the Native Local Government Councils Ordinance 1949–58 provides for the establishment of schools by local authorities.

In providing education for the indigenous people many social, linguistic and other factors must necessarily be taken into account, notably the wide diversity of social groups, the existence of several hundred distinct languages, and the fact that indigenous people range from those who have had several generations of close contact with Europeans to those who still live a primitive life and are making their first contacts with the world beyond their own immediate environment. The population also includes European, Asian and mixed-race groups, whose manner of living is such that special provision must usually be made for them.

All government education is controlled by the Department of Education, with headquarters at Port Moresby, which both conducts its own schools and also has overall control of schools conducted by missions and any other non-government schools. Native local government authorities may establish schools, assist in their operation, and make recommendations in respect of local education, although these schools are staffed and controlled by the Department of Education.

For historical and other reasons private agencies, for example the religious mission organizations, play a very important part in the provision of education. They conduct

a large number of schools at all educational levels, which are subject to administration supervision and control.

Students who complete grade 6 in the primary schools designed chiefly for non-indigenous students, and students of appropriate age and educational standard who complete standard 6 in the indigenous primary school system proceed to grades 7 and 8 and thence to forms 1 and 2, on the completion of which they attempt the Queensland Junior Public Examination. Alternatively, on the completion of grade 6 or standard 6, students may proceed to secondary schools in one of the Australian States.

In general, however, students who complete standard 6 in the indigenous primary schools proceed to post-primary education as follows: (a) intermediate school (standards 7 to 9), followed by forms 1 and 2, as referred to in the above paragraph; or (b) technical training centre (years 1 to 4).

For secondary studies above the level of the Queensland Junior Public Examination, students go to Australia.

Beyond the secondary level, the whole range of further education available in Australia is open to children of the territory who have the necessary academic qualifications. Within the Territory, various forms of training are available, such as teacher training courses. The Auxiliary Division of the Public Service is designed as a training division in which the officers receive training and education to acquire the qualifications demanded for entry into the normal divisions of the Public Service. Thereafter, the Public Service Institute provides opportunities for higher study.

Non-indigenous children usually complete grade 6 at about 12 years of age and indigenous children usually complete standard 6 at about 14 years, although there is a wide range in the ages of children at post-primary levels.

THE DEVELOPMENT OF SECONDARY EDUCATION

Until 1942, there were separate Administrations for Papua and for New Guinea. Education was left almost entirely in the hands of the missions, each of which determined its own pattern of education. There was some stress on technical education of a practical character for older students, but for the most part education was elementary.

Following the re-establishment of civil government and the provisional union of the two territories, a Department of Education was set up in 1946. The first problem was, and still is, the extension of primary education as an essential foundation for higher education. Post-primary education was, however, given in the Territory in a 3-year central (since re-named intermediate) school course, to be followed by a 2-year secondary course, a teacher-training course, and technical training courses.

In 1957, the local secondary course was replaced by the course leading to the Junior Public Examination provided in the Australian State of Queensland.

Meanwhile, in 1954, a system of scholarships was introduced under which up to 20 indigenous students are selected each year for secondary education in Australia.

Special provision was found necessary for the secondary education of non-indigenous students and, by a series of measures since 1951, all qualified non-indigenous students who proceed to Australia for secondary education receive an allowance designed to cover the additional costs faced by parents, and in certain cases special bursaries are also given. Secondary classes were established at Rabaul in 1951; these have been developed and are now being extended to other large centres in the Territory. They will be open to all non-indigenous and indigenous students who meet the necessary standards.

Legal basis

There is no legislation covering secondary education, other than the Education Ordinance 1952–57 referred to earlier. Although education is not compulsory, there is provision in that Ordinance for the introduction of legislation for compulsory education either throughout the Territory or in certain areas.

The Native Apprenticeship Ordinance 1951–55 provides the legislative basis for the Native Apprenticeship Scheme.

Administration

The Department of Education is responsible for such matters as the preparation and revision of syllabuses and textbooks. Textbooks adapted to local conditions have been prepared by the Department of Education, by some missions, and by the South Pacific Commission's Literature Bureau. The Department of Education acts as a clearing house in such matters. Non-government schools follow departmental syllabuses and some textbooks are included in the free issue provided to them.

An Education Advisory Board, established in 1953 with both mission and administration representation, advises on all educational matters. District Education Committees with similar representation perform this function at the district level.

Education is centrally controlled by the Administration through the Department of Education. The line of control is from the Director of Education to chiefs of divisions, to district education officers to the teachers in charge of schools.

No public authorities other than the Department of Education conduct secondary schools, although some authorities such as the Department of Public Health, the Department of Agriculture, Stock and Fisheries and the Native Apprenticeship Board provide or arrange training courses for students at the normal secondary school age levels.

Mission organizations are controlled by inspection to ensure that the requirements of the Administration are met. The system of government grants-in-aid, provided on an established basis, is a further means of ensuring that overall policy is maintained in mission schools. The larger missions have appointed officers to deal with the Department of Education, which itself maintains a Mission Relations section.

In addition to the staff of full-time inspectors the district education officers carry out inspections as part of their normal duties. All are trained and experienced teachers either promoted from other positions within the Department of Education or, in some cases, recruited from Australia. These officers report on both government and mission schools, their functions being broadly similar to those of inspectors in Australia.

No other agencies have supervisory functions, although

missions may establish their own methods of supervising their own educational work.

All Department of Education funds come from the general Administration budget which is derived from local revenue and a grant from the Commonwealth of Australia. Funds for expenditure on capital works also come from the Administration budget. Some contributions to the financing of education are made by native local government councils or parents' committees, where these exist. With the exception of minor items, all expenditures are made by the Department of Education, not by the school.

Mission organizations obtain their funds for education from their own sources and from government grants-in-aid which provide payment of £40 to £400 per annum in respect of each mission teacher (the amount varying with the teacher's qualifications), payments in respect of students enrolled at the higher levels, and payment for all necessary school equipment and supplies. Administration teachers are paid by the Department of Education; mission teachers by their employers.

No fees are charged in schools in the Territory. Assistance to parents includes free tuition in all schools, free board for indigenous children in boarding schools (most schools at the secondary and higher levels are boarding schools) and generous allowances to students attending secondary schools in Australia.

As regards school buildings, specific standards are not laid down, but the Education Regulations require that buildings meet a satisfactory standard in respect of access, drainage, light, ventilation, sanitary facilities, space and seating accommodation.

TYPES OF SECONDARY EDUCATION

The educational possibilities open to the primary school leaver have been summarized in the section dealing with the educational system as a whole. In selecting the type of post-primary education they wish to pursue students are assisted by Department of Education officers who point out the various types available and guide students towards the most appropriate. Guidance to students proceeding to Australia is provided by a special section of the Department. The guidance services in the various Australian States are also available to students from the Territory.

The Education Regulations require that the amount of class time at post-primary level should be as follows: intermediate schools—30 hours per week for 40 weeks; indigenous secondary schools—25 hours per week for 40 weeks; non-indigenous secondary schools—25 hours per week for 42 weeks; technical schools—25 hours per week for 42 weeks. All schools are required to work five days a week, taking the normal Territory public holidays, and the usual practice is to have the long vacation during the December/January period. The school year is being reorganized at present with a view to providing four terms instead of the usual three.

General Secondary Schools

General secondary education is offered in intermediate schools and in schools which follow the Queensland course up to Junior Public Certificate level; students from the Territory may also attend school in Australia. Details are set out below concerning the two types of schools available in the Territory. For details of the general secondary schools in Australia, the chapter on Australia should be consulted.

Intermediate schools. These schools are for indigenous pupils. The course is adapted to the needs of the Territory and allows students to proceed, on completion, to courses following the Queensland secondary school syllabus.

Students are required to have passed an examination at standard 6 level. Most intermediate schools serve fairly large areas since the indigenous population is scattered; in general they are free boarding schools.

Two courses are available, one for boys and one for girls, including respectively manual training and domestic arts. At a school at Vunamami an agricultural project method is used, and all school instruction revolves around the practical agricultural work done at the school.

The distribution of time recommended by the Department of Education for intermediate schools, in hours per week, is as follows: English 9, mathematics 6, social studies 4, hygiene 1, science 2, manual training 2½, art 1, religious instruction 1, ethics and morals 1, sport 2½; making a total of 30 hours. At the end of the course, students sit for an examination at standard 9 level set centrally.

The teaching staff in intermediate schools consists for the most part of experienced non-indigenous teachers trained in Australia and of indigenous teachers who have taken the teacher training course 'C' or its equivalent.

Schools following Queensland courses. Two stages of post-primary education are available in these schools: Queensland grades 7 and 8, which are strictly a continuation of primary schooling, and the 2 years, sub-junior and junior, which lead to the award of the Queensland Junior Public Certificate.

The first stage is provided for students who have completed the primary course designed principally for non-indigenous students. The second stage is for those who have completed either Queensland grade 8 or the intermediate school course.

The purposes of this form of secondary education are to provide a sound general education and the educational background necessary as a preparation for further training or higher secondary education (the latter at present being available only in Australia and not within the Territory).

In the first stage, the subjects are general primary subjects. In the second stage, students may take English, mathematics 'A' and 'B' (arithmetic, algebra, geometry and trigonometry), geography, social studies, manual training, agriculture and commercial subjects, and a further variety of courses is to be offered.

The teaching staff is the same as that in similar Australian schools.

Vocational and technical schools

A wide variety of full-time and part-time courses in vocational fields is provided for the indigenous people. For the most part these cannot be considered as secondary

education or its equivalent, as the students may include adults and students who lack an adequate background of primary education. It should also be noted that, for those with the necessary educational background, courses may be taken in Australia, that extensive use is made of the facilities at the Central Medical and Nursing Schools at Suva, and that use is made of various other overseas courses such as those conducted in various fields by the South Pacific Commission. Courses in the Territory which are likely to retain their present form for some time and which require a sound primary education background include midwifery and infant welfare courses, agriculture courses, courses at technical training centres, and apprenticeship.

Midwifery and infant welfare courses. Students are brought up to standard 6 level and take 2- and 1-year courses respectively, including both practical and theoretical studies. At the end of the courses, they either sit for oral, written and practical examinations for assistants' certificates, or take an oral examination only, to become midwifery or infant welfare attendants.

Agriculture. At Mageri, Papua, a 12-month course is available to students with an educational background varying from standard 6 to standard 9. The course provided includes study of agriculture, botany, farming mathematics, elementary agricultural economics, plant diseases and pests, and practical agriculture.

Technical training centres. Four-year full-time courses are available for students who have completed standard 6. The first 2 years of the course provide general education at post-primary level in English, arithmetic, social studies, general science, technical drawing, woodwork and metalwork. In the second 2 years, the students specialize in one of the following trades: auto mechanics, aircraft mechanics, boat building, carpentry and joinery, cabinet making, cane work, diesel mechanics, fitting and turning, plumbing, painting and decorating, film projection, postal trades, printing trades, sheet metalwork, welding and wood machinery. Additional fields for specialization are planned. The technical training centres are conducted and staffed by the Department of Education.

Apprenticeship. Students having the necessary educational qualifications may be apprenticed under the Queensland Apprenticeship Board and receive tuition by correspondence. The Native Apprenticeship Scheme also provides for young people without these qualifications to undertake a broadly similar form of training. In addition to their normal employment, students under this scheme attend a technical training centre for certain evening classes and for a full day each fortnight of practical and theoretical instruction.

Teacher training courses

Three 1-year teacher training courses are provided in the Territory for indigenous students, courses 'A', 'B', and 'C'. Course 'A' prepares students to teach up to standard 2, Course 'B' to standard 6, and Course 'C' to teach in intermediate schools. The courses prepare prospective teachers not only to give instruction in the schools but also for their exacting role as interpreters of contemporary culture to the people among whom they work and as leaders of their community.

Entrance to each course is by a standardized examination. Course 'A' trainees have completed standard 6, Course 'B' trainees have completed standard 8 or 9, and Course 'C' trainees have generally taken the course up to the Queensland Junior Public Examination. Other factors, such as aptitude for teaching, are taken into account in the recruitment of trainees. At the end of each course, students sit for an examination which determines their future status.

The subjects of study and the number of hours per week devoted to each subject, in Courses 'A', 'B' and 'C' respectively, are as follows: method of teaching and special teaching methods—10, 10, 12; school management—4, 4, 3; demonstration and criticism lessons—1, 1, 1; supervised teaching practice—4, 4, 4; method of teaching handicrafts—1, 1, 0; method of teaching gardening—1, 1, 0; method of teaching physical education—2, 2, 1; blackboard practice and drawing—1, 1, 1; singing—1, 1, 0; religious and moral instruction—0, 0, 1; school hygiene and first-aid—0, 0, 1. The total number of hours per week is thus 25 for each course. Training centres are staffed by qualified and experienced teachers.

In addition, teaching standards are maintained by a regular programme of in-service training which includes supervision and advice from qualified teachers, vacation and refresher courses, and in some cases educational tours of Australia.

TRENDS AND PROBLEMS

In the Territory of Papua and New Guinea a largely primitive society is being developed rapidly towards the stage where the people will be able to manage their own affairs.

As the result of concentration on the needs of primary education, the number of students ready for secondary education is now increasing steadily, with a consequent need for expansion of secondary education facilities.

For reasons relating to their educational and cultural background, indigenous students are generally much older at the secondary level than non-indigenous students. Up to the present this has made it necessary to provide separate schools and, in most cases, separate syllabuses.

As the number of secondary students increases and as the standards of indigenous students rise, the aim will be to provide schools to which all children will have equal access and to offer classes up to matriculation level, and in due course establish a separate Territory syllabus which is both adapted to the needs of the Territory and meets a standard of matriculation acceptable to Australian institutions of higher training.

Concurrently, there will be a steady improvement of standards in such fields as teacher training, agriculture and health courses, and more courses adapted to local conditions will be offered as the quality of candidates improves and their numbers increase.

STATISTICS

Population (mid-year 1958 estimate): 1,341,000.
Area: 93,000 square miles; 240,870 square kilometres.
Population density: 14 per square mile; 6 per square kilometre.

Summary of school statistics, 1953–57. In 1957, total school enrolment was 125,000 pupils, representing less than 10 per cent of the total population. Practically all these pupils were in primary schools, where the proportion of girls was 41 per cent. Only 7 per cent of the teachers were women; the average number of pupils per teacher was 27. Between 1953 and 1957, school enrolment increased by 43 per cent. (See Table 2.)

Educational finance 1956/57. In the fiscal year beginning 30 June 1956, educational expenditure by the Commonwealth Government amounted to 639,419 Australian pounds, representing an average expenditure of about 10/- per inhabitant. Recurring expenditure was 92 per cent of the total. (See Table 1.)

PAPUA

The Australian Territory of Papua forms an Administrative Union with the Trust Territory of New Guinea, designated as the Territory of Papua and New Guinea. Education in both of these territories is administered as a single programme, and the information set out in the section dealing with the Trust Territory of New Guinea applies equally to Papua.

STATISTICS

Population (mid-year 1958 estimate): 487,000.
Area: 90,540 square miles; 234,498 square kilometres.
Population density: 5 per square mile; 2 per square kilometre.

Summary of school statistics, 1953–57. In 1957, total school enrolment probably reached 50,000 pupils, or about 11 per cent of the total population. The proportion of girls in primary schools was 42 per cent, and the average number of pupils per teacher was 26. Women teachers were about 20 per cent of the teaching staff in primary schools. Total enrolment increased by about 9 per cent. (See Table 2.)

Educational finance, 1956/57. For the fiscal year beginning 30 June 1956, educational expenditure of the Commonwealth Government for Papua amounted to 427,274 Australian pounds, averaging less than £1 per inhabitant. Recurring expenditure was 87 per cent of the total. (See Table 1.)

THE EDUCATIONAL SYSTEM

As long ago as 1848 the foundations of Austria's present-day educational system were laid in the Basic Plan for Public Education in Austria, drawn up by Franz Exner.

The compulsory primary school (today including primary, upper primary and special schools), which is the corner-stone of the whole system, was established by the Imperial Law on Primary Education (*Reichsvolksschulgesetz*) of 14 May 1869 in the form which, subject to the amendments introduced by the Supplementary Law of 1883 and by the Upper Primary School Law of 1927, it still has today. The training schools for men and women teachers and for girls' handicraft teachers are closely linked with the development of the compulsory primary school system; the same is true of training centres for women kindergarten and nursery school teachers.

The 'Magna Charta' of the general intermediate or secondary school system (*allgemeinbildende Mittelschule*) in Austria is the Plan for the Organization of General Secondary Schools (*Gymnasien* and *Realschulen*) in Austria, together with the accompanying Instructions, drawn up by Exner and Bonitz in 1849. Despite the many amendments and additions which have since become necessary, that basic plan still holds good today.

The main provisions governing the administration and inspection of Austrian schools go back to Article XVII of the Fundamental Law of 21 December 1867, under which the State exercises supreme control and supervision over the whole educational system—this had previously been the prerogative of the church authorities, acting on behalf of the State. (Religious instruction in schools is now provided by the churches or religious communities concerned.) Any citizen with the necessary qualifications may found a private school. The implementing Law of 25 May 1868 provided that the State should exercise its authority through the Ministry of Education and that every *Land* should have a Provincial Board of Education (*Landesschulrat*) (for secondary and lower schools), and every educational district a District School Board (*Bezirksschulrat*) (for schools belonging to the primary school system). The provincial boards of education were established as bodies organized on democratic lines, with elected representatives of the provincial government, the provincial diet and teachers.

The system of school administration and inspection thus established was adopted in the Constitution of the First Republic. The school supervision laws of the *Länder* were brought into line with the new constitutional situation. Since Vienna was separated from Lower Austria and established as an independant *Land*, it had its own education authorities—the Viennese Municipal Board of Education—which combined the functions of a provincial and a district board of education.

These various educational authorities remained in power until the end of the First Republic, when the National Socialist Government ousted them and, by introducing a foreign system, interrupted the whole normal historical development of Austrian education.

The Provisional National Government set up on 27 April 1945 brought the Federal Constitution as drafted in 1929 into force again. The various education authorities which had been abolished by the National Socialist Government were reinstated—not however as representative bodies, but as official departments. All the organic laws and regulations enacted since 5 March 1933 were annulled and all regulations of the National Socialist régime 'incompatible with the existence of a free and independent Austria, contrary to the legal concepts of the Austrian people, or which reflect typical National Socialist tenets' were repealed. Pending the solution of the legal problems, a series of preliminary administrative measures have been taken to ensure the continued running of schools on lines in conformity with the ideals of modern Austria. The formidable task of recodifying educational legislation in Austria still has to be faced; so far it has not been possible to accomplish it.

From the racial, linguistic and religious points of view, the population of Austria today is extremely homogenous—only in Burgenland and Carinthia are there small linguistic minorities. (For the Slovene minority in Carinthia the Law of 19 March 1959 for the Protection of Minorities (*Minderheitenschutzgesetz*) in Carinthia, enacted in conformity with the Austrian State Treaty, provides for the use of the Slovene language in primary education and for the establishment of a federal secondary school for Slovenes.) The social structure throughout the federal territory also shows a considerable degree of uniformity. The passing of new school laws (recodification of Austrian educational legislation) will not be an easy matter on account of the various divergencies of opinion between the chief political parties on cultural, political, philosophical and international questions, which also affect their attitude to questions of school organization; to some extent, too, these divergencies of opinion reflect centralizing or federalistic trends respectively.

Under the provisions of the Law on Private Schools of 27 June 1860, every Austrian citizen—a term which includes national corporations—is entitled, in accordance with Article XVII of the Fundamental Law of 21 December 1867 on the common rights of citizens, to establish and run private schools, although it would not be true to say that private bodies exercise a direct influence over school administration and inspection in Austria today. Since the time of the First Republic there have been parents' associations, in which school questions are discussed; only recently a parents' advisory board has been re-established to advise the Federal Ministry of Education.

The structure of the Austrian school system may be seen in the diagram on page 217.

THE DEVELOPMENT OF SECONDARY EDUCATION

The 1849 Plan for the Organization of General Secondary Schools (*Gymnasien* and *Realschulen*) has already been mentioned. From 1864 onwards 4-class *Realgymnasien* were introduced. The transformation of *Realschulen*, usually consisting of 6 classes and having a pre-vocational bias, into general secondary schools was brought about by the Secondary School Laws (*Realschulgesetze*) of 1869 and 1870; they were next turned into 7-class schools and became 8-class schools in 1927. These Secondary School Laws, with a few amendments introduced later, still form the basis of the secondary school system.

In 1890, hygiene and physical training became compulsory in secondary schools; the introduction of a school medical service followed in 1906.

Secondary education for girls was also introduced at the beginning of the century.

The Secondary School Reforms (*Marchetsche Schulreform*), carried out in 1908 when Marchet was Minister, constituted an important step forward in the development of the secondary education system. In addition to the existing *Gymnasien*, 4-class *Realgymnasien*, *Realschulen*, girls' general secondary schools (*Mädchenlyzeen*), etc., two other important new types of secondary school were then introduced: an 8-class *Realgymnasium*, where, in addition to Latin (beginning in the 1st class), a modern language was taught from the 3rd class upwards (instead of Greek, as in the *Gymnasien*); and a *Reformrealgymnasium*, providing a basic education without Latin, but with a senior section (5th to 8th classes) in which Latin and one modern language were taught.

These innovations were followed, in 1921, by the establishment of 4-class senior secondary schools for girls (*Frauenoberschulen*), following on, as a rule, from the first 4 secondary school classes (*Lyzealklassen*) or some other junior secondary school. Since 1919, however, girls have also been entitled to enrolment in the 1st class of boys' secondary schools as public pupils.

The organization of *Gymnasien*, *Realgymnasien*, *Realschulen* and girls' senior secondary schools, as decreed in 1908 (or 1921), remained the same in essentials until 1927. Mention must also be made of the state (now federal) schools, established under the Law of 28 November 1919, which are boarding-schools of the *Realgymnasium* type enabling gifted pupils, irrespective of their parents' income, to have the benefit of a complete secondary education, the full cost being borne if necessary by the State.

The whole of the general secondary school system in Austria was for the first time given a common legal basis by the Secondary School Law of 2 August 1927 (Federal *Official Gazette*, No. 244). Under this law, two special kinds of general secondary school were also established—the secondary schools for workers (*Arbeitermittelschulen*) and the post-primary continuation schools (*Aufbaumittelschulen*). The relevant curricula were published in 1928. This law was revised in 1934.

After the liberation of Austria in 1945, all the curricula

GLOSSARY

Berufsschule für Lehrlinge: part-time vocational training school providing 8 to 10 hours per week of compulsory supplementary schooling for apprentices in trades and commerce.

Bildungsanstalt für Arbeitslehrerinnen: specialized teacher training school for women teachers of needlework and sewing.

Bildungsanstalt für Gewerbelehrerinnen/ Bildungsanstalt für Hauswirtschaftslehrerinnen: specialized teacher training schools for women teachers of manual crafts for women and home economics.

Bildungsanstalt für Kindergärtnerinnen und Horterzieherinnen: specialized teacher training school for pre-primary teachers.

1–4jährige Fachschulen: full-time vocational training schools, each institution preparing for one particular trade.

Frauenoberschule: general secondary school for girls with a curriculum including modern languages and emphasizing subjects pertaining to feminine interests.

Gymnasium: general secondary school with obligatory study of Latin and Greek.

Handelsakademie: vocational secondary school of commerce.

Handelsschule: vocational secondary school of commerce.

Hauptschule: upper primary school.

Haushaltungsschule, Hauswirtschaftsschule: vocational training school of home economics.

höhere Abteilungen der technischen und gewerblichen Lehranstalten: vocational training schools each specializing in the teaching of a group of related trades or occupations.

höhere land- und forstwirtschaftliche Lehranstalten: vocational training schools of agriculture and forestry.

Kindergarten: pre-primary school.

Lehranstalt für gewerbliche Frauenberufe: vocational training school for women's occupations.

Lehranstalt für hauswirtschaftliche Frauenberufe: vocational secondary school of home economics.

Lehranstalt für soziale Frauenberufe: vocational training school for women social welfare workers.

Lehrerbildungsanstalt: teacher training school.

niedere land- und forstwirtschaftliche Lehranstalten: vocational training schools of agriculture and forestry.

Realgymnasium: general secondary school with obligatory study of Latin and one modern language.

Realschule: general secondary school with obligatory study of two modern languages.

Volksschule: public primary school.

HIGHER EDUCATION

A. *Katholische Theologie:* faculty of Catholic theology.

B. *Evangelische Theologie:* faculty of Protestant theology.

C. *Rechts- und Staatswissenschaft:* law and political science.

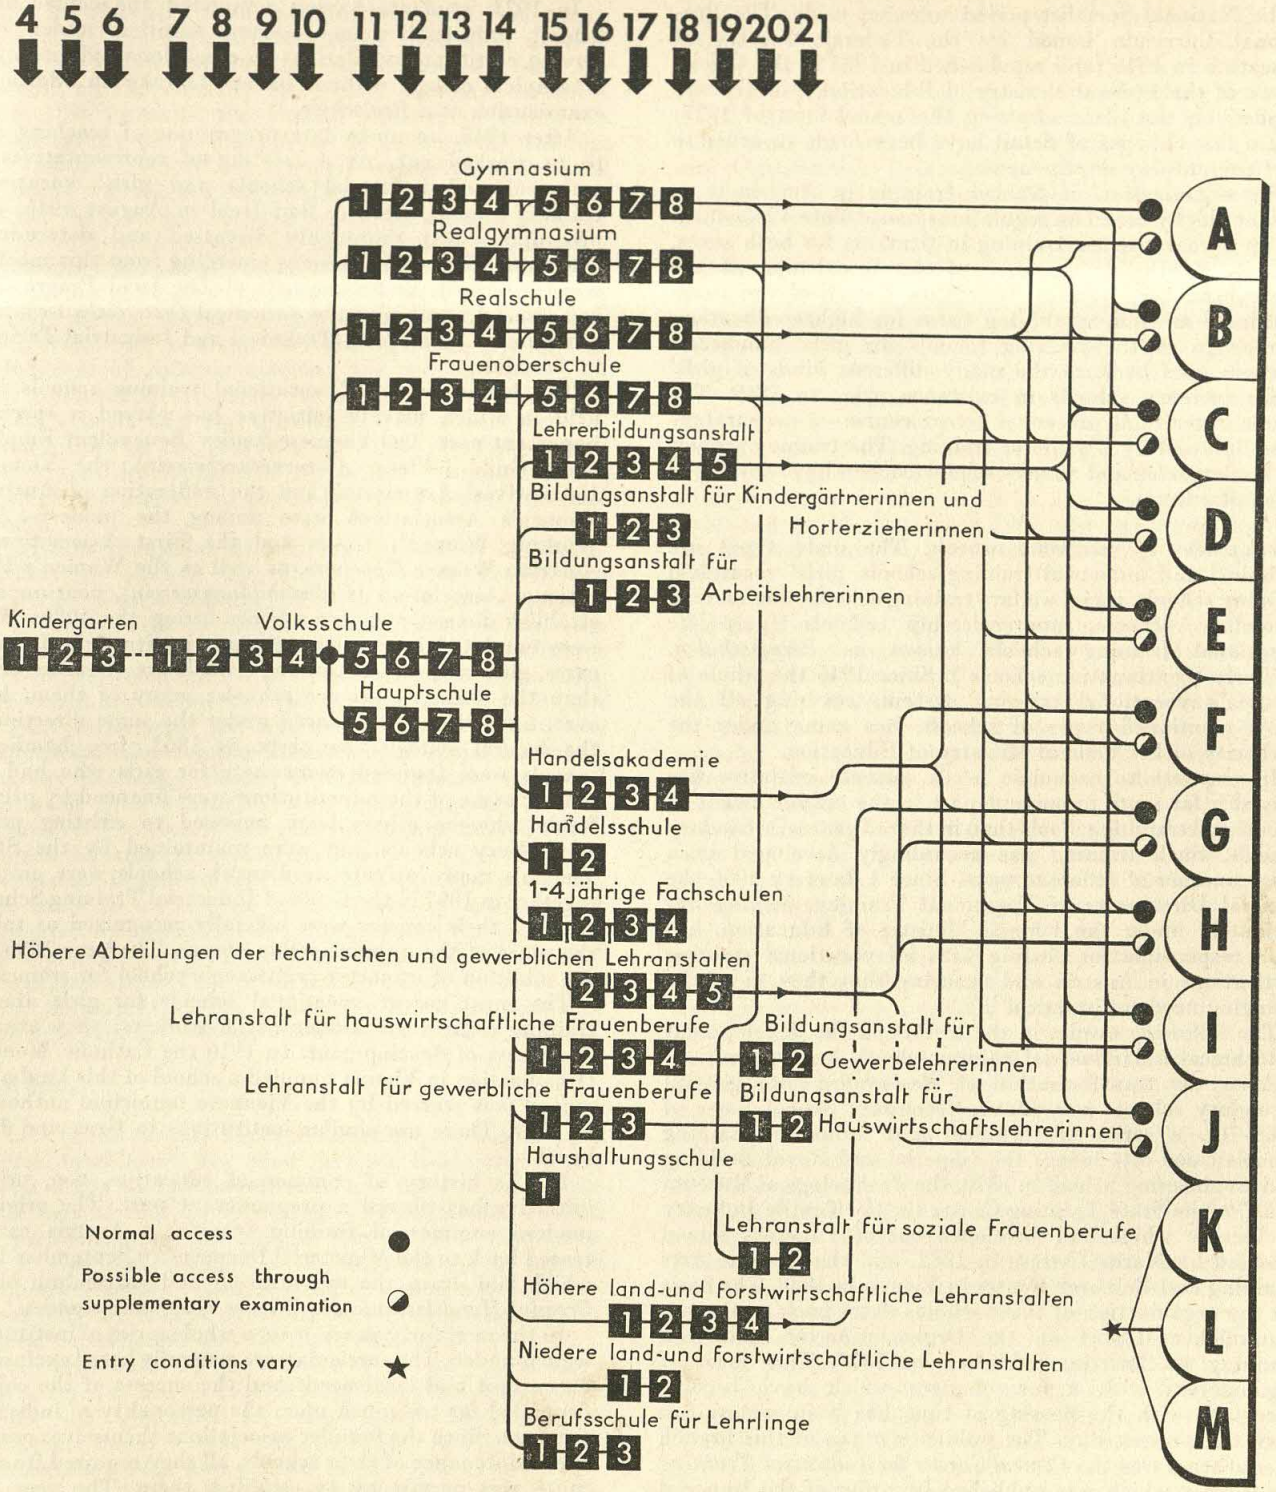
D. *Medizin:* medicine.

E. *Philosophie and Pharmazie:* philosophy (arts and sciences) and pharmacy.

F. *Technische Hochschule:* technical college.

G. *Hochschule für Bodenkultur:* agricultural college.

H. *Montanistische Hochschule:* mining college.



I. *Tierärztliche Hochschule:* college of veterinary science.

J. *Hochschule für Welthandel:* college of higher commercial studies.

K. *Akademie für bildende Kunst:* academy of fine arts.

L. *Akademie für angewandte Kunst:* academy of applied arts.

M. *Akademie für Musik und darstellende Kunst:* academy of music and dramatic art.

of the National Socialist period were set aside. The Provisional Curricula issued by the Federal Ministry of Education in 1946 (and republished in 1955 in the *Official Gazette* of the Federal Ministry of Education, No. 87) 'are founded on the ideas inspiring the school laws of 1927; only a few changes of detail have been made in order to meet present-day requirements'.

The organization of teacher training in Austria is at present chiefly based on regulations issued since 1945 which set up 5-year teacher training institutions for both sexes, making it possible, because of the broadening of the curriculum, for trainees to obtain the *Realgymnasium* certificate as well, qualifying them for higher education. The origin of the training schools for girls' handicraft teachers goes back to the many different kinds of girls' senior primary schools in existence prior to 1869. The course is really at present a 3-year course—a preparatory class followed by 2 years of training. The training schools for kindergarten and nursery school teachers have developed on similar lines.

Development of vocational schools. The main types are technical and industrial training schools, girls' vocational training schools, social welfare training schools, commercial secondary schools, apprenticeship schools (part-time vocational training schools known as *Berufsschulen*, formerly 'continuation schools'). Since 1945 the whole of Austria's vocational training system, covering all the above-mentioned types of schools, has come under the authority of the Federal Ministry of Education.

In response to economic needs, private initiative has played a far more prominent part in the establishment of vocational training schools than in that of general secondary schools. Such training has accordingly developed in a great number of different ways. Since 1 January 1956 the General Directorate of Vocational Training, coming immediately under the Federal Minister of Education, has been responsible for dealing with all vocational training institutions in Austria and ensuring that they meet the changing needs of practical life.

The following events in the history of the development of technical and industrial training schools deserve mention.

After the transformation of *Realschulen* into general secondary schools (see above, Secondary School Laws of 1869–70), a series of technical and industrial training schools came into being: the Imperial and Royal Building and Engineering School in 1870, the Technological Museum in 1879, the State Training Centre for the Textile Industry in Vienna, which had developed out of a factory school founded by Maria Theresa in 1882, and the Graphic Arts Training and Research Centre in Vienna in 1888. The basis for the organization of these schools dates back to the von Dumreicher Report on the Organization of Industrial Training in Austria, published in 1875. This form of organization with a few changes which have become necessary with the passing of time has been maintained until the present day. The publicity organ of this branch of education was the *Central Gazette for Industrial Training in Austria*, which was published by order of the Imperial and Royal Ministry of Religion and Education and appeared from 1883 to 1918 (publication was resumed in 1947).

In 1921, students having completed the course at a federal industrial school became entitled under new leaving certificate regulations to conditional admission to a technical college without having to take an additional examination at a *Realschule*.

After 1945, an up-to-date programme of teaching had to be worked out. At a meeting of representatives of technical and industrial schools and girls' vocational training schools, held at Bad Ischl in August 1946, this programme was thoroughly discussed and determined. The time-tables and decisions emerging from this meeting were published, under the title of The Ischl Programme, in a special number of the periodical *Österreichs technisch-gewerbliches Schulwesen* (Technical and Industrial Training in Austria).

The history of girls' vocational training schools is a field in which private initiative has played a specially important part. The Viennese Ladies' Benevolent Employment Guild (*Wiener Frauenerwerbverein*), the Viennese Housewives' Association and the Federation of Austrian Women's Associations were among the pioneers. The Working Women's Union and the First Association of Austrian Women Teachers, as well as the Women's Educational Association (*Frauenbildungsverein*), continued to establish domestic science schools during the 1920s. They were emulated by various religious institutions. In some cases, girls' vocational training schools are of earlier origin than the domestic science schools; many of them, however, have since been placed under the same direction as the federal schools. As early as 1862, free handicraft schools were founded everywhere for girls who had left school; some of these institutions were financed by private funds whereas others were annexed to existing public compulsory schools and were maintained by the State. Vienna's many private needlework schools were grouped together in 1897 in the Guild of Industrial Training Schools. In 1907 their courses were officially recognized as taking the place of the apprenticeship course. The year 1936 saw the addition of a master craftsmen's school for women.

The most recent vocational schools for girls are the training centres for women social workers; they are still in process of development. In 1916 the Catholic Women's Organization in Vienna founded a school of this kind and a second was started by the Viennese municipal authorities in 1917. There are similar institutions in Graz and Innsbruck.

In the history of commercial education, too, private initiative has played a preponderant part. The origin of modern commercial training schools in Austria can be traced back to the Ministerial Decree of 26 September 1848, which laid down the organization and curriculum of the *Gremial-Handelsschule des Wiener Kaufmannstandes*.

In the next forty years or so, a whole series of institutions were founded. The curricula were generally based exclusively on current and local needs and the success of the courses depended far too much upon the personality of individual teachers. Since the founder associations themselves ensured the maintenance of their schools, all they required from the State was permission to establish them. The year 1873 saw the promulgation of the Commercial School Law of Lower Austria, which determined the whole course of development of the commercial training system.

The pressing need for a degree of uniformity was met in 1896, when the Federal Ministry of Education induced those responsible for running the schools to base the teaching on the officially established standard curricula. From 1896 onwards, the Federal Ministry of Education systematically devoted attention to commercial training, and thanks to its efforts a sound system of commercial education was methodically built up.

After the National Socialist regime the country reverted to the well tried commercial curricula and examination regulations laid down under the First Republic. The introduction of modern curricula (1952 and 1959), the grant of civil service status to the teachers (their numbers rising from 140 to about 900 federal teachers), the establishment of assistant teachers, the opening of over 20 new commercial secondary schools, the rebuilding of several schools and the introduction of a new type of school known as the *Lehrbüro*—all these measures testify to the rapid development of commercial training schools, in which the number of pupils has trebled over the past 5 years.

Part-time industrial schools were previously known as continuation schools. The Regulations for Trades and Industries (*Gewerbeordnung*) of 1897 made it compulsory for all apprentices to attend a continuation school; the Continuation School Law of 1907 provided for extensive specialization, combined with a practical workshop training suited to industrial needs. The Continuation School Law of 1923 introduced day-time classes generally in the continuation schools (apprentices have to spend one whole week-day attending classes, whereas formerly they had 'continued their education' at evening classes, or even on Sundays), so that it was possible to appoint specialists to teach full-time in continuation schools. The attempts to introduce improvements, for which this law paved the way, came to an end in 1938. Workshop training was supplanted by demonstration teaching and the specialists were replaced by general teachers (*Einheitslehrer*). In 1945 the reorganization of the continuation school system began. Today the apprenticeship schools are known as part-time vocational schools (*Berufsschulen*).

Legal basis

So far, the Austrian Federal Constitution has not, in general, established any final dividing line between the powers of the Central Government and those of the *Länder* in the field of education. Secondary education falls within the jurisdiction of the Federal Government, subject to the proviso that changes in the organization of general secondary schools in each of the nine *Länder* can be introduced only by means of concordant laws passed by the Federal Government and the *Land* concerned.

The legal bases of the various types of school have been referred to above. It is recalled that general secondary schools are governed by transitional administrative regulations based on the legal principles and systems of organization which had existed before 1938. These regulations are in conformity with the Secondary School Law of 1927, but there are certain divergencies, particularly as regards foreign language teaching. A decisive part in making Austrian secondary schools what they are today has been played by the curricula which were drawn up in 1945 and, with a few changes, were republished on 15 October 1955 in the *Official Gazette* of the Federal Ministry of Education (see Bibliography). Other important regulations deserving special mention are the Decree of 22 January 1949 relating to the secondary school leaving certificate, the Examination and Classification Ordinance of 22 May 1946, which is applicable to all secondary schools, and the Decree of 22 January 1949 governing holidays.

Teacher training (*primary school teachers*). Until 1937, the training of primary school teachers, girls' handicraft teachers, and kindergarten and nursery school teachers, was governed by a section of the Imperial Law on Primary Education of 1869. Since 1945, training schools for men and women teachers have been further developed by administrative decrees, particularly in the sense that the training schools' final examination has, since 1951, conferred the same university entrance qualifications as the *Realgymnasium* certificate. Here also, the new curricula published on 15 September 1957 and the regulations for the final examination, issued on 1 February 1950, deserve mention.

Vocational education. There are not now any laws governing commercial secondary schools (4-year commercial colleges—*Handelsakademien*—and 2-year commercial schools—*Handelsschulen*), technical and industrial training schools (5-year industrial schools and 2 to 4-year full-time vocational schools), and girls' vocational schools (2 to 3-year full-time training schools and 1 to 4-year domestic science schools). These schools were created by administrative decrees and have since been developed and adjusted to meet the needs of the economy. Reference has already been made to the Ischl Programme of 1946, which laid down directives for the organization and curricula of technical and industrial schools and girls' vocational schools. (See also under 'Types of secondary education'.)

The legal basis for the part-time continuation schools for apprentices was provided by the Continuation School Laws of the individual *Länder*, which were partially built up at the turn of the century and redrafted after 1920. These laws were made of no effect by a series of regulations passed during the National Socialist period and today represent only a very fragmentary foundation for the organization of these schools, which are now generally known as part-time vocational schools (*Berufsschulen*). In the Compulsory Schooling Act of 1938 (*Reichsschulpflichtgesetz*), enacted during the German occupation, compulsory attendance at a part-time vocational school was introduced for all young people who had completed their compulsory general education (compulsory primary schooling) and were not attending a secondary school, but in the absence of more precise regulations for its implementation this rule is in fact only applicable to apprentices within the meaning of the Austrian Regulations for Trades and Industries (*Gewerbeordnung*). The establishment and maintenance of public industrial and commercial schools, as well as the part-time domestic science schools at present existing only in the Vorarlberg province, were recently regulated by the federal law establishing principles for the maintenance of compulsory schools, dated 13 July 1955, and the relevant

directives for its implementation issued in each of the *Länder*.

Religious instruction. Until 1938 religious instruction was a compulsory subject in all Austrian general schools and in a number of vocational training schools. Under the National Socialist regime, however, it was first reduced, to an optional subject and later, to all intents and purposes abolished. In 1945, by administrative regulation, religious instruction was again made a compulsory subject, but the right to withdraw pupils from scripture lessons was recognized. The position in this respect was legally consolidated by the Law on Religious Instruction of 1949, which at the same time defined the legal status of scripture teachers. The latter are now either appointed as state teachers with the approval of the corresponding church or religious community, or are appointed by the church (or religious community); in either case, they are paid by the State. Supervision of religious instruction is carried out by appropriate inspectors appointed by the church (or religious community) and partly remunerated by the State.

Legislation governing the teaching profession. The conditions of service of federal teachers employed in Austrian state schools are governed by the Imperial Law of 1917 on the Teaching Profession (*Lehrerdienstpragmatik*); their remuneration is governed principally by the Law on Salaries of 1956, which covers the whole civil service. The individual branches of the teaching profession are dealt with in the Decree of 13 May 1958. Teachers under contract to the Federal Government are covered by the provisions of a special law of 1948 on contractual service.

Administration

Secondary schools are either public or private schools. According to the Law on Responsibility for School Maintenance (*Schulerhaltungs-Kompetenzgesetz*), of 13 July 1955, public secondary schools are those maintained by the Federal Government; all others are private schools [six convent *Gymnasien* are, for historical reasons, known as 'public endowed secondary schools' (*öffentliche Stiftsgymnasien*)]. Private schools may, however, be granted public school status by the Federal Minister of Education, which means that they are authorized to award state-recognized certificates on the same basis as public schools. The administration of public secondary schools comes under the immediate authority of the provincial board of education in each *Land* (in Vienna the Municipal Board of Education) and under the higher authority of the Federal Ministry of Education. The federal educational institutions, which were founded in 1919 and are a happy combination of secondary day-school and boarding-school, are in a special position, as are also the federal technical and industrial schools and girls' vocational training schools in Vienna; these schools, as central bodies, come under the immediate authority of the Federal Ministry of Education. So far as private schools are concerned, school supervision is the responsibility both of the immediate authorities (provincial educational authorities) and of the higher authorities (the Federal Ministry of Education).

Agricultural and forestry schools come under the Federal Ministry of Agriculture and Forestry.

The secondary school system (excluding agricultural and forestry schools) is planned and organized by the Federal Ministry of Education, while the administrative measures entailed are generally the responsibility of the provincial educational authorities. The Federal Minister of Education is a member of the Federal Government and is politically responsible to Parliament. In the Ministry, there is a Department of General Education, a Directorate-General of Vocational Education, and a Legal Department dealing with the whole system of general and vocational secondary education, and primary education. The Department of General Education is subdivided into: a division for primary, upper primary, and special schools and for teacher training; a division for secondary schools; a school methodology division (responsible particularly for the preparation of curricula and the approval of textbooks); a staff division (teachers); and a division of physical education and school medical and health services. The Directorate-General of Vocational Education is divided into various offices, dealing respectively with part-time vocational schools, technical and industrial schools, girls' vocational schools and commercial schools. There is also a special office for questions relating to general education in all vocational schools. The Legal Department includes a legislative division, divisions for the legal and administrative affairs of general and vocational schools respectively, and a division for school buildings, although the actual building work, of course, comes under the Federal Ministry of Trade and Reconstruction.

As advisory bodies to the Federal Ministry of Education, there is a conference of educational specialists and a parents' council, composed of representatives of the central organizations of parents' associations; these two bodies are periodically invited to hold discussions with the Federal Minister of Education and senior officials of his Ministry.

Supervision and inspection. Direct supervision of secondary schools is the responsibility of the provincial school inspectors, who are civil servants appointed by the Federal President upon the proposal of the Federal Minister of Education, who in turn receives proposals from the provincial school authorities; they are assigned by the Federal Minister of Education to the provincial boards of education for one or more categories of schools. The number of provincial school inspectors allotted to a provincial board of education depends upon the size of the province and the number of schools and categories of schools. Provincial school inspectors are recruited from the ranks of the most outstanding and experienced teachers. They exercise direct supervision over public and private schools and over all teachers, whose performance they are also responsible for judging. Administratively, the provincial school inspectors are on the staff of the provincial educational authorities, to which they have to report.

Finance. A proportion of the annual federal budget is set aside to finance the federal school system. Federal teachers are paid by a central Salary Office. School building is financed by the Federal Ministry of Trade and Reconstruc-

tion out of its own budget. Provision for school equipment and educational materials is generally made centrally by the Federal Ministry of Education or the provincial educational authorities; for smaller items of expenditure, school managers have available current expense funds, of which accounts have to be rendered.

An annual fee is charged in secondary schools amounting, in federal secondary schools, to 90 schillings (i.e. the price of 55 lb. of bread), but this sum may be reduced in certain cases.

Buildings and equipment. In contrast to the position as regards compulsory primary schools, there are no special regulations, apart from the general building regulations, for secondary schools. One of the main problems facing the Federal Ministry of Education is the need to make up for the shortage of school premises resulting from war destruction and from the interruption of building activities during the war.

School welfare services. The school health service in secondary schools, which generally includes regular medical examinations for preventive purposes, is the responsibility of the school doctors; a school doctor is assigned to each school and is treated as a member of the teaching staff.

In addition to their main purpose, which is to create a bond between school and home, parents' associations are principally concerned with charitable activities, which generally take the form of providing the school library with textbooks for the poorer pupils.

TYPES OF SECONDARY EDUCATION

This section will deal with education available for children who have terminated their 8 years of compulsory schooling. With most pupils, this means that they have successfully reached the end of the eighth primary school class, the fourth upper primary school class or the fourth class of a general secondary school, and that they are 14 or 15 years old.

In addition to the principal types of secondary school described below there is also what is known as 'the 1-year course'. This refers to special courses for children over school age which, according to paragraph 10 of the Imperial Law on Primary Education, are organized at primary, upper primary and special schools and are intended to consolidate the knowledge and skills acquired in those schools. The curricula, which are generally drawn up for individual schools, must provide both for the group of pupils who are to be articled as apprentices and for those wishing to go on to other schools (generally secondary). Since the number and type of such voluntary pupils vary at different times and in different places, these courses are held only on an *ad hoc* basis, and often only as occasion arises. By a Decree of 21 November 1953, the Federal Ministry of Education issued new directives on the organization of such courses.

The curriculum of a given type of school in Austria is the same for all pupils attending such a school, which means that all pupils who have selected a particular type of school take the same course, with the exception of optional subjects. (This is true for all secondary schools, with the exception of the *Gymnasien*.) There is therefore no question of choosing between different courses within the same type of school. Educational guidance at this stage is thus confined to the choice of the type of school. In general secondary schools, the task of giving educational advice to pupils and parents falls to the educational guidance counsellors (see below).

In all secondary schools and similar institutions, the summer holidays last two months, beginning on the first or second Monday in July (according to the province). The new school year begins on the Monday in September following the completion of the two months' holiday. The head of a secondary school can declare two days during the school year to be holidays (*Direktorstage*), and the provincial school authorities are entitled to prescribe one other day's holiday. In general and commercial secondary schools, the school year is divided into three terms, in all other schools it is divided into two. For secondary school pupils, a skiing course (lasting one week) is organized during the winter and during the summer months 'school country weeks' (*Schullandwochen*) are often arranged. Once a term (or half-year) an official parents' day is held, and throughout the school year at least one hour a week is set aside for receiving parents.

General secondary schools

Candidates generally enter the junior department of general secondary school (*Gymnasium*, *Realgymnasium*, *Realschule* or *Frauenoberschule*) after completing the fourth primary school class (at age 10), and taking an entrance examination. However, pupils may also transfer from a compulsory primary school to a secondary school at a later stage. In order to move up from the junior to the senior department of a general secondary school, it is not necessary to pass any examination. Pupils who have reached the end of the fourth upper primary school class can enter the senior department (fifth class) of a general secondary school (*Realschule* or *Reformrealgymnasium* Type C) without taking an examination, provided that they have obtained very good marks; but if their performance has been only average, they are obliged to take an entrance examination in all subjects. The general secondary school course ends with a school leaving examination (*Maturitätsprüfung*), which qualifies successful candidates for university entrance.

The 8-class secondary schools differ both from the primary and upper primary schools and from the full-time and part-time vocational training schools, in that they aim at carrying on general education up to a higher level. But this also means that all the pupils' intellectual, moral and physical powers have to be developed according to their own particular individual capacities and that they have to be equipped to take part in the various forms of cultural life. This education, by its nature, standard and breadth, is likewise intended to qualify pupils to devote themselves to higher studies at a later stage and there, at college or university, combining the advantages of professional training and general education to develop into personalities of a high intellectual and moral calibre.

A modern language is a compulsory subject in all four

types of secondary schools from the first to the eighth class (except that in *Gymnasien* it is an optional subject in the senior department); the languages taught differ from one type to another. In *Gymnasien* and *Realgymnasien*, Latin is taught from the third class upwards. (There are, however, *Gymnasien* where Latin is taught from the first class upwards.) Greek is started in the senior department of the *Gymnasium*, whilst, in that of the *Realschule*, a second modern language or Latin is studied as well as the first modern language, and in that of the *Frauenoberschule* a second modern language is begun.

The *Gymnasien* seek to achieve the educational aims outlined above by providing an education based on the ideals of humanism, bringing their pupils to an understanding of the ancient world and showing them how our modern culture is rooted in antiquity. The *Realschulen*, which have been general secondary schools since 1870, lay greater emphasis on the part played by the natural sciences and mathematics in the moulding of modern European thought, outlook and consequently way of life. Since 1908, the *Realgymnasien* have been original in that, within the same realm of ideas, they seek mainly to trace the connecting links in the history of intellectual development; the necessary historical basis is provided by studying Latin and ancient culture. Since 1921, it has been the aim of girls' senior secondary schools (*Frauenoberschulen*) to link up the modern, scientific, European concept of the world with the idea of personal service to one's fellow men, springing on the one hand from woman's natural role as a mother but deriving also from her position in family life.

According to its particular educational aims, each type of secondary school has its own curriculum and time-table and these are set out in the following table.

TIME-TABLES IN UPPER CYCLE OF GENERAL SECONDARY SCHOOLS
(in periods per week)

Subject	Class 5				Class 6				Class 7				Class 8

G = *Gymnasium* Rg = *Realgymnasium* R = *Realschule* FOS = *Frauenoberschule*

1. In girl's classes, or mixed classes with at least 10 girls, this is increased by one period.
2. May be replaced by Latin in *Realschulen*.
3. In girls' classes, or mixed classes with at least 10 girls, this subject is dropped and the periods devoted to further teaching of the first modern language and natural science (see note 1).
4. Beginning at the 5th class in *Gymnasien* and *Realgymnasien*, or at the 7th class in *Realschulen*, pupils choose either art or music.
5. In classes 5 and 6 one period, and in classes 7 and 8 two periods, are spent out of doors whenever weather permits.

Educational and vocational guidance. Since 1949, most Austrian general secondary schools have had educational counsellors; they are members of the teaching staff who have taken special courses in vocational guidance and have had a psychological training which enables them, in co-operation with other teachers and the vocational guidance officers of the employment authorities, to give advice to the pupils in their school—generally those in the fourth class or those who are taking the school leaving certificate—on their future education (the choice being: for fourth class students, continuation of general secondary education or transfer to a vocational school; for those who are taking the school leaving examination, university studies or a non-academic profession). In this connexion, mention must be made of the system of Austrian Secondary School Leavers' Weeks (*Österreichische Maturandenwochen*). Whenever possible, all the leaving certificate candidates of a secondary school are brought together for some days

(in Vienna, they attend a series of lectures), when representatives of all sections of industry, the liberal professions and the civil service, in co-operation with the educational counsellors and vocational guidance officers, give lectures or act as discussion leaders with the object of helping school leavers to make a well considered choice of a profession. The educational counsellors also, however, have the important task of giving advice and psychological assistance in the case of educational troubles and difficulties. They provide liaison with the psychoeducational centres which are, to some extent, organized as child guidance clinics. The whole School Psychology Service in a *Land* comes under the *Land* officials in charge of vocational guidance services (*Landesreferenten für Schule und Beruf*) who, through the provincial school authorities, maintain liaison with the central officials in charge of vocational guidance services in the Federal Ministry of Education.

For the purposes of educational and psychological guidance, including advice on the choice of careers, individual graphs are made out for all pupils in Austrian schools up to 14 years of age (completion of compulsory schooling and the junior departments of secondary schools); when compulsory schooling comes to an end, these graphs serve as summary statements providing a basis for vocational guidance.

Achievement testing. For promotion purposes in Austrian secondary schools, a 5-grade scale of marks (very good, good, satisfactory, fair and unsatisfactory) is used. In order to move up from one class to another, a pupil must not have 'unsatisfactory' in any of the compulsory subjects. A distinction is made between 'guidance tests' and classification tests. Constant observation of the pupil's knowledge and abilities, and of his mental processes and behaviour in working through new programmes of study and making use of, and reference to, what he has already learnt, gives the teacher a basis for judging the pupil's capacities. Since tests and examinations are not essential features of education, there is a general instruction that classification tests shall be set only when absolutely necessary (see the Decree of the Federal Ministry of Education on 'Tests and Classification' of 22 May 1946, No. 13643).

Teachers. Teachers of general secondary schools have had a thorough academic education and have taken the Secondary School Teachers' Diploma at an Austrian university—most of them take it in conjunction with a Doctorate in Philosophy. After passing this examination, a candidate must next perform 1 year's probationary service in a secondary school; he then receives a certificate testifying that he is qualified for appointment as a teacher under contract (*Vertragslehrer*). After about 5 to 8 years of satisfactory service, he is finally established and has the title of *Professor* conferred upon him.

Special secondary schools

The following special types of *Realgymnasium* or *Gymnasium* have existed since 1927: secondary schools for workers, post-primary continuation schools, the *Werkschulheim Felbertal*, the Federal *Realgymnasium* for Slovenes at Klagenfurt (at which the language of instruction is Slovene), and the Federal Senior *Realschule* at the Military College at Wiener Neustadt.

The object of the secondary schools for workers is to enable pupils whose gifts warrant a secondary education and who, after completion of their compulsory schooling, have either taken a course of vocational training or have started on their careers (and are at least 17 years old), to reach the same standard as students who have obtained the *Realgymnasium* certificate. The course at these schools for workers consists of nine semesters, and the classes are usually held in the evenings.

The post-primary continuation schools provide a specially planned 5-year course designed to enable gifted young people who have completed their compulsory schooling to engage in secondary studies (these courses are intended primarily for the rural population). From the second year onwards, students at these schools can work for the *Gymnasium* or *Realgymnasium* certificates.

The *Werkschulheim Felbertal* was founded as a private school in the autumn of 1951. It provides a secondary education of the *Realgymnasium* type, combined with training in a trade, in a special kind of educational community (boarding school system). The students not only take the senior school leaving examination but also a journeymen's examination (locksmith's trade, carpentry or radio-engineering). The course lasts 9 years; the school has public school status and is assisted by the Federal Ministry of Education as a very important educational experiment. The institution is shortly to be recognized as an official industrial school by the Ministry of Trade.

The vocational school leaving examination was introduced in 1945. It gives people who have been unable to take an ordinary school leaving examination which would qualify them for university entrance, but who wish (at a riper age and after acquiring professional experience or pursuing an occupation involving serious studies in a particular field) to study their subject more thoroughly at a university, an opportunity to prove that they are suitably qualified and prepared for such studies.

Vocational and technical schools

Technical and industrial training schools. Candidates for admission must have completed the last year of compulsory primary schooling or the fourth class of a secondary school. Admission is subject to their passing an examination, which is supplemented by tests, employing the methods of industrial psychology, designed to establish suitability for a particular profession. Technical and industrial schools include the senior divisions of federal industrial schools or *Bundesgewerbeschulen* (5-year course leading up to a leaving certificate examination which, if the board of examiners is unanimous, qualifies students for entrance to a college of technology or similar institution of higher education, or qualifies them for a senior technical appointment and gives them the right, after 4 years' experience in the appropriate field, to the title of 'engineer'), and the full-time advanced vocational schools or *Fachschulen* (2 to 4-year course). Completion of this full-time course takes the place of the usual evidence that the candidate has duly completed his apprenticeship in the trade concerned.

For all schools coming under this head the Ischl Programme of 1946 (see above) provides, *inter alia*, as follows:

1. The official entrance examination designed to test candidates' knowledge (*Kenntnisprüfung*) is supplemented by a careful psycho-technical aptitude test in which the candidate must show his natural ability for a particular type of vocational training and at the same time for his later profession.
2. The principle of a basic division between the two parts of the 5-year senior departments of federal industrial schools has been adopted, and enables a further selection of pupils to be made in the light of their abilities and performance. These institutions have a 2-year junior section (which is run on the lines of a full-time vocational school) and a 3-year senior section. The junior section is mainly concerned with basic training in the various trades and helps pupils to acquire the necessary practical skills in the branch of study which they have chosen. The possibility of continuing studies in the senior sections (*Höhere Abteilungen*) is open only to pupils who during the first and second years have shown evidence of an intellectual aptitude conducive to further development.
3. Besides the technical training in trades and crafts which they provide, all technical and industrial schools also endeavour to broaden the mental horizon of their pupils by laying particular emphasis on general education; the subjects taught under this heading are German, history, geography, civics and a modern language, so that trained technicians will in future be able to play a greater part than hitherto, not only in economic life but also in the nation's cultural life, besides being able to gain a direct knowledge of neighbouring countries.
4. As it is desirable for a pupil to be acquainted, from the moment when he enters the school, with the atmosphere of his future profession, the schools are being developed as model industrial undertakings. Thus workshop training forms the core of every branch of specialized technical education.
5. The Ischl Programme further provides for the constant adjustment of workshops and curricula to technological progress and changing industrial needs. Technological branches of study have multiplied and expanded to such an extent that it is no longer possible to deal with them exhaustively in school, even as special subjects. Only part of the subject matter taught can remain unchanged for any length of time; more latitude will have to be allowed for future development in this respect.

It is impossible within the bounds of this report to describe all the technical and industrial schools providing a 5-year course. The time-tables of the full-time vocational schools (*Fachschulen*) and the senior sections (*Höhere Abteilungen*) for mechanical engineering, electrical engineering and over-ground building may be consulted in the publication *Das Schul- und Bildungssystem in Österreich* (The School and Educational System in Austria), 1958.

Full-time vocational training schools with courses lasting 2 or 3 years may either form part of a senior department (leading to the secondary school leaving examination) or exist as independent institutions from which students may, after taking an entrance examination, transfer to a senior department.

Girls' vocational training schools. Domestic science training schools admit pupils who have completed the upper primary school course or that of the junior department of a secondary school, and who have passed an aptitude test. These schools fall into four categories. The full-time domestic science training schools (*Hauswirtschaftliche Fachschulen*) endeavour in a 1-year course to ensure that their pupils acquire all the necessary knowledge and skills that will be required of them as domestic helps in a household. These are all boarding-schools. The housekeeping schools (*Haushaltungsschulen*), also providing a 1-year course, are by far the most common schools of this kind; they train pupils for their future duties as housewives and teach them how to run a small household economically and efficiently. The domestic economy schools (*Hauswirtschaftsschulen*), providing a 3-year course, give their pupils a broad general education as a basis for a specialized theoretical and practical training in housekeeping for large institutions; they also provide a very thorough training for all types of women's occupations—welfare workers and children's nurses, as well as domestic economy and handicraft teachers. Lastly, in a few experimental schools providing a 4-year course of domestic training, there are signs of a move towards a domestic economy training of secondary school standard (*Hauswirtschaftliche Mittelschule*); these courses should provide training for teachers, housekeepers and bursars in charge of large social welfare institutions, boarding schools and children's homes, sanatoria and homes for the aged, hospitals and convalescent homes.

Girls' industrial training schools run a few special training courses for the dressmaking trade, production of linen goods, art needlework, or millinery. Requirements for entry are the same as for domestic science schools. The courses are usually held in two-class full-time training schools, which take the place of the 3-year apprenticeship course. For dressmaking, there are also three-class full-time training schools, in the third class of which the pupil is already an assistant and has to work so hard that this class may be counted as equivalent to 2 years' work as an assistant.

The social welfare schools for women require candidates for admission to be at least 19 years old, to have completed secondary school or the 3-year course at a domestic economy school and to have passed an entrance examination or aptitude test. The course lasts 2 years and pupils are trained for posts as welfare workers and social assistants or nursery school and kindergarten teachers.

Part-time vocational training schools. These are compulsory schools for apprentices or girls who have left school. They may be divided into industrial schools, commercial schools, and domestic science schools. They can be considered as an integral part of the training given to apprentices in the workshop or business, and are designed to provide them with academic instruction calculated to supplement and improve their actual vocational training. The minimum duration of instruction is 3 school years, with 360 teaching periods. The domestic science training schools exist only

in the Vorarlberg province and count as compulsory schools offering a 2-year course.

Commercial secondary schools. These institutions comprise the 4-year commercial academies (*Handelsakademien*) and the 2-year commercial schools (*Handelsschulen*). They follow on from the course at an upper primary school or the junior department of a secondary school, and candidates for admission are required to pass an entrance examination in German and arithmetic. The commercial academy certificate not only replaces the certificate stating that candidates have duly served their apprenticeship in a given branch of commerce, but also entitles them, on presenting evidence of 1 year's service in a commercial firm, to employment as managers or to set up in business for themselves. Pupils who pass the final examination at a commercial academy also qualify for admission to the college of international trade and, on certain conditions, to the faculties of jurisprudence and political science of universities and also to agricultural colleges.

Attached to the commercial academies are special courses, known as *Abiturientenkurse*, designed for students who have passed the secondary school leaving certificate (qualifying them for higher education); these courses provide a full commercial training and lead to qualifications equivalent to those conferred by the commercial academies themselves.

The commercial school leaving certificate takes the place of the certificate of duly completed apprenticeship in a given branch of commerce.

The main objective of the commercial academies is to teach pupils economic reasoning, or the appraisal of expenditure and income, and for this purpose the subjects of commercial accounting, commercial correspondence and book-keeping, preparation of balance sheets and taxation are so grouped around the central subject of business management as to give pupils a practical and easily surveyed store of knowledge and to provide not only a sound business training but also a good groundwork of theory.

Teacher training schools

Teacher training schools for general teachers in primary schools. Nearly 90 per cent of the candidates for enrolment come from the fourth class of an upper primary school or junior secondary school, and only a small percentage (3 to 4 per cent) from the eighth primary school grade. Candidates for admission to teacher training schools are required to pass a written and oral examination in German and mathematics, and to supply proof both of their physical fitness and of adequate musical talent. Possibilities of acceptance are limited by the fact that only 40 new students can be enrolled each year and that, save in exceptional circumstances, schools are forbidden to provide parallel courses. Students who have successfully completed the 5-year course take a qualifying examination for the Primary School Teachers' Diploma; those who obtain it are eligible for provisional appointment in Austrian primary schools and also have qualifications equivalent, for university entrance purposes, to those of holders of the *Realgymnasium* leaving certificate.

Candidates for final appointment as primary school teachers must have had at least 2 years' practical experience of teaching and must take the primary teachers' qualifying examination before a Board of Examiners for general primary and upper primary schools (including special schools and special examinations). For final appointment to an upper primary school, candidates must take the qualifying examination for upper primary school teachers, and for final appointment to a special school the qualifying examination for special school teachers.

Demonstration schools are annexed to the training schools for men and women teachers, and students also take a 3 weeks' course in village school methods at rural demonstration schools.

Training schools for girls' handicraft teachers. Candidates for enrolment have to pass an entrance examination, give proof of physical fitness and be at least 15 years of age in the preparatory class or 16 years of age in the first-year class. The course lasts 2 years, or 3 years if the preparatory class, which is attended by almost all pupils, be counted. The qualifying certificate is awarded at the end of this training or can be obtained by means of an examination taken privately. For final appointment as handicraft teachers in upper primary schools, candidates must take an appropriate qualifying examination in the relevant subjects before a Board of Examiners for general primary and upper primary schools (including special schools and special examinations).

Training schools for kindergarten and nursery school teachers. In the training of kindergarten and nursery school teachers at the appropriate training schools, which now offer a 3-year course, account is taken of all the requirements of modern early childhood education and every aspect of child care. The training is based on the new curriculum for these institutions, dated 25 August 1958, which was published in the *Official Gazette* of the Federal Ministry of Education, No. 10a, 1958. The training concludes with the qualifying examination for kindergarten and nursery school teachers.

Other specialized schools

In Austria, the general secondary school leaving examination can also be taken by people who have studied for it privately. This procedure is most commonly adopted by adults, already working, who have had no opportunity to attend a secondary school and wish to obtain the school leaving certificate. These examinations (*Externistenreifeprüfungen*) are held by a special board of examiners. There are a number of private institutions preparing candidates for this examination, generally by means of evening classes. Another possibility is for students to follow a private course and then take a further examination, additional to the leaving certificate examination already passed. For example, the qualifications acquired at a technical or industrial training school can be followed up by studies leading to the *Realgymnasium* leaving certificate. For these examinations, too, the special boards of examiners operate.

Training schools for hospital and children's nurses come under the authority of the Federal Ministry of Social

Welfare, which is also responsible for midwives' schools (candidates for admission must be at least 20 years old) and the Federal Technical Training School, which is a special vocational training school for the physically handicapped. This school has specialized sections, providing a 3-year course designed particularly for adolescents and 1-year courses intended primarily for adults, and offers physically and mentally handicapped people (excepting the blind) an opportunity to train for some profession which they can take up despite their disability. Candidates for admission must be 14 years old and have reached the required standard at the end of the fourth upper primary or secondary school class or the eighth primary school class. (The blind are trained at the Federal Institute for the Blind, and the deaf and dumb at the Federal Institute for the Deaf and Dumb in Vienna.)

As regards schools coming under the jurisdiction of the Federal Ministry of Agriculture and Forestry, agricultural secondary schools provide courses lasting 4 or 5 years. The junior full-time agricultural training schools provide a 2-year course, but also hold 2-semester and shorter courses. The specialized agricultural training schools organize special courses, which are usually short (one winter or one summer), for forestry workers, tractor-drivers, milkers, weavers, those responsible for the care of agricultural implements, etc. The length of the course in junior full-time forestry schools is 2 years. The specialized forestry schools arrange courses lasting from 1 to 2 weeks.

Out-of-class activities

In many Austrian secondary schools there are 'school communities' (*Schulgemeinden*) which provide an opportunity for teachers and pupils to work together and for pupils to acquire experience of self-government. They represent one of the most promising means of training pupils for democracy. The organization and tasks of school communities may be briefly described as follows: a school community is a body consisting of the headmaster (or headmistress), teachers and pupils of a school. It is based on established 'class communities'. The representatives of the various classes are responsible for promoting a corporate spirit within the class group itself and good relations between teachers and pupils. It is their duty to draw the teachers' attention to any special difficulties experienced by their fellow-pupils and to endeavour to strengthen the latter's sense of duty so that they co-operate in efforts to achieve the school's educational goals. School communities are also responsible for helping in school government, organizing school events and co-operating in the installation of classrooms and school libraries. They are also expected to deal with leisure time activities, such as running school clubs, editing school magazines, helping to maintain relations with schools abroad, and so on.

School communities work in close contact with all bodies concerned with the out-of-school education of young people and with leisure time activities, notably the Youth Section of the Federal Ministry of Education and its offices in the provinces. These offices support and advise the school communities, in addition to other youth organizations, and also arrange further training courses for practical youth work. They are likewise concerned with the civic education of young people, the promotion of out-of-school sports and games, hiking, the protection of nature, and the influence of films (protection of young people from harmful films and promotion of good films). School communities also co-operate with the Youth Theatre (*Theater der Jugend*), which arranges for schoolchildren to attend the best plays and concerts at reduced prices.

Many secondary school libraries are also run by school communities. These are generally the large libraries which, in addition to good children's books, also include works illustrating and filling out the teaching given on Austrian and German literature and that of other countries. In addition to the *Theater der Jugend*, the movements known as *Das Burgtheater kommt in die Schule* and the *Länderbühne* also help in enabling children to see representative performances of classics in world drama. Well-known actors assist in educating their future audiences by giving performances in schools.

The school radio, which since the second world war has once more developed remarkably into an indispensable teaching aid, is not only an excellent medium for language teaching (every month as many as 10 modern language lessons are broadcast for the 5th to the 12th school grades) but also helps to make the teaching of other subjects more alive, particularly by music broadcasts, literature programmes, and history, geography and natural history broadcasts. There are also broadcasts on scientific and technical subjects and scripture, and special programmes for commercial schools. Educational films have become a very important factor, not only in actual teaching but also in other spheres of school life. School television is at present being developed.

TRENDS AND PROBLEMS

Preparations for the recodification of the whole system of school legislation in Austria, and the relevant efforts at reform in the field of secondary education, are among the main preoccupations of all the Austrian educational authorities. Proposals are at present being considered for converting all secondary schools to a 5-day week system—at the moment lessons are given on all 6 week-days, although lessons generally end on Saturdays at 1 p.m. at the latest—and taking the necessary measures to this end. Connected with this are the long-discussed and still unsolved problems of whether to extend the compulsory schooling period from 8 to 9 years, and how to organize the new ninth year of schooling to be introduced (as a 5th primary school class or a 9th school grade), and also whether to extend secondary education from 8 to 9 years. The Federal Ministry of Education has been endeavouring for years to achieve what is known as *Hinwendung zum Kind* (taking special account, in teaching and education, of child development). In this field noteworthy results have already been achieved.

STATISTICS

Population (mid-year 1958 estimate): 7,021,000.
Area: 32,374 square miles; 83,849 square kilometres.
Population density: 217 per square mile; 84 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, school enrolment totalled 1,127,380 pupils (not including some 191,000 persons enrolled in adult education courses). This represented about 16 per cent of the total population. Of these pupils, 8 per cent were in kindergartens, 64 per cent in primary schools, 7 per cent in general secondary schools, 19 per cent in full-time and part-time vocational education, and 2 per cent in higher education. The proportion of girls was 50 per cent in primary schools, 38 per cent in general secondary schools, 35 per cent in vocational schools, 63 per cent in teacher training schools, and 22 per cent in higher education. Women teachers were 51 per cent of the teaching staff in primary schools, where there was an average of 22 pupils per teacher. Between 1953 and 1957, primary school enrolment decreased by 12 per cent, while secondary enrolment increased by 36 per cent. (See Table 1.)

Enrolment trends in secondary education, 1930–57. In 1957, general secondary school enrolment was half as high again as in 1930, while teacher training enrolment was at approximately the same level. Between these years there were substantial fluctuations in both categories of secondary education. Furthermore comparable data are not available for the various types of secondary vocational education. For the period 1955–57, the ratio of secondary enrolment to the estimated population 15–19 years old was 16, excluding vocational education; with the inclusion of the latter it was about 53. (See Table 3.)

Examination results in secondary education, 1953–57. The number of pupils who passed the general secondary school leaving examination in 1957 was about double that in 1953. The proportion of girls passing this examination in 1957/58 was 39 per cent. The number of pupils who passed the various examinations on completion of vocational courses continued to increase between 1953 and 1957, this increase amounting to 63 per cent in the case of industrial courses, and 75 per cent in the case of girls' vocational courses. In the commercial courses, the increase was more than three and a half times. Only in the number of teachers' diplomas was there hardly any increase, the total number of such diplomas granted in 1957 being only 7 more than in 1953. (See Table 2.)

Educational finance, 1957. For the year 1957, total educational expenditure amounted to 3,611 million schillings, averaging 516 schillings per inhabitant. The Federal Government provided 68 per cent of the total, the provincial governments 5 per cent, local authorities 20 per cent, the rest coming from tuition fees, gifts, etc. Recurring expenditure, which was 89 per cent of the total, was distributed by level and type of education as shown in Table 4C.

BAHRAIN

The great demand for education in Bahrain has always been motivated by the national aspirations of the people and is part of the general demand for education among the Arab countries of the Middle East. The immediate cause, however, of the remarkable expansion of the school system was the improvement in the country's economic situation as a result of the discovery of oil in 1932, an event which brought about a revolutionary change in the Bahraini way of life.

THE EDUCATIONAL SYSTEM

The present educational system was developed as a result of co-operation between the Egyptian Ministry of Education and the Bahrain Education Department, which began in 1944. Since then the number of schools and the number of pupils enrolled have increased rapidly. In 1937 there were 10 schools at primary level, including 2 for girls, and some classes giving elementary training in carpentry and workshop; the total enrolment was about a thousand. By the end of the school year 1958/59 there were 49 primary schools, 3 of them large enough to accommodate 1,000 pupils each, the boys' secondary school, and the technical school, with a total enrolment of 17,883 pupils, boys and girls.

There has been a corresponding expansion of administrative and supervisory services. The Director of Education, as head of the Education Department, is assisted by a secretariat division and a staff division. In 1957 an Assistant Director was appointed, and a Superintendent of Primary Education whose duties include supervision of primary school organization and the planning and supervision of certificate examinations. The actual supervision of teaching is carried out at present by inspectors from the Egyptian educational mission. A Council of Education was also established in 1957 with seven members, four representing the four municipal councils and three nominated by the Government. In the same year the post of Superintendent General was created, the functions of this official include the supervision of secondary education.

SECONDARY EDUCATION

There are three government institutions providing education at this level: a technical school for boys, opened in 1937; a secondary school for boys, opened in 1940 and transferred to its present well-equipped premises in 1950; and a secondary school for girls, opened in 1951.

General secondary schools. The course of study at the boys' secondary School lasts 4 years, during the first 2 of which

there is a common curriculum of general subjects. In the third year pupils choose one of three streams: academic—with two sections, literary and scientific; commercial; and teacher training. The only qualification required for admission to the school is possession of the Primary School Leaving Certificate but applicants for the teacher training stream are selected with the personal qualities of a good teacher in mind.

The curricula and textbooks are almost identical with those used in the Egyptian region of the United Arab Republic. The main subjects—Arabic, English and mathematics—are studied in all sections, though not to the same standard nor with the same number of periods per week. Each stream or section has its own special subjects: commercial—Arabic and English typing, book-keeping, economics and business methods; teacher training—psychology, teaching method and hygiene; literary—literature, language and history; scientific—physics and chemistry.

The course at the girls' secondary school also lasts 4 years, and is very much the same as the academic stream at the boys' school, but with special emphasis on subjects like domestic science.

The technical school. Since coming under the supervision of the Education Department in 1955 the technical school has been undergoing a number of essential improvements. Prior to 1958 the school admitted pupils who had completed only the third or fourth primary grade, but since then the Primary School Leaving Certificate has been required for entry and the technical school has thus been brought into line with the boys' secondary school. Pupils without this entrance qualification attend a preparatory class at the school.

The technical school offers courses in lathe mechanics and bench work, forging and welding, casting and modelling, carpentry, motor mechanics or electricity. In 1959 the school was endowed with a well-equipped chemistry laboratory.

TRENDS AND PROBLEMS

The ever-increasing demand for secondary education is a problem for which the Education Department has to find a solution, and another secondary school is needed.

In other Arab countries the course of study which brings the student to University Entrance level lasts 12 years but in Bahrain only 10. The extension of the secondary school course to 5 years is now under consideration.

One of the greatest difficulties is the shortage of trained teachers. As in other countries, many of the best students choose to study medicine or engineering, for which the financial rewards are so much more attractive. The educational authorities are doing their best to remedy this by (a) increasing the number and improving the quality of training courses for the local teachers, and (b) by sending every year an increasing number of students to universities and higher institutes in Beirut, Cairo and the United Kingdom.

[*Text prepared by the Education Department, Bahrain, in April 1960.*]

STATISTICS

Population (mid-year 1958 estimate): 139,000.
Area: 231 square miles; 598 square kilometres.
Population density: 602 per square mile; 232 per square kilometre.

Summary of school statistics, 1953–59. In 1959/60, there were 17,831 pupils enrolled in all public schools, representing about 13 per cent of the total population. The proportion of girls was 31 per cent. The teaching staff consisted of 688 teachers, with an average number of 26 pupils per teacher. (See Table.)

Examination results in secondary education, 1958/59. One hundred boys and 14 girls passed the secondary school leaving examination in 1958/59, and 16 boys received the technical school leaving certificate.

Educational finance, 1957/58. In 1957/58, total expenditure for education amounted to 6,728,000 rupees, representing an average expenditure of Rs.48 per inhabitant. (Official exchange rate: 1 rupee = 0.21 U.S. dollar.) Of this sum Rs.5,257,900 was spent on boys' schools, equivalent to Rs.475 per pupil, and Rs.1,470,100 on girls schools, or Rs.290 per pupil.

BELGIUM

THE EDUCATIONAL SYSTEM

The Constitution of 1831, which laid the political foundations of modern Belgium, proclaimed the freedom of education. Article 17 states: 'Education shall be free, and all obstructive measures shall be forbidden. Offences shall be punishable only in accordance with the law. Public instruction provided at the expense of the State shall likewise be governed by the law.'

Two main teaching systems have evolved during the past 130 years within the compass of the Constitution. They embrace all degrees of education and give particular importance to secondary education. One is the public system: it consists of institutions founded and administered by the State, the provinces and the local authorities. The other is the private system, *enseignement privé* or *enseignement libre*. The immense majority of the institutions in this system are Catholic.

As regards organization, the schools of the two systems have a very similar and often identical structure.

Education is, as a rule, in the language of the area, that is, in French in the southern part of the country, Flemish in the north and German in certain parts of the east. In the Brussels area, however, and in communes on the linguistic frontier which the law describes as bilingual, the rule is that the pupil shall be taught in his maternal or usual language.

The structure of Belgian education is shown in the diagram on page 237.

THE DEVELOPMENT OF SECONDARY EDUCATION

Secondary education (*enseignement du second degré*) for boys and girls between the ages of 12 and 18 comprises general secondary education (*enseignement moyen*), technical education, teacher training and artistic education. Mention should be made here, as belonging to the same level, of the *quatrième degré*, a 2-year terminal course which still exists in some primary schools. School attendance is compulsory until the age of 14 but is, in practice, voluntarily prolonged to 16 years by more than half the school population. A bill has been introduced for the extension of compulsory school attendance to the age of 15 years.

Historical and legal basis

The structure of secondary education is determined by the Organic Law of 1 June 1850 which has been amended many times since. All these amendments were recently co-ordinated by the Royal Order of 30 April 1957. The syllabus is laid down by the Act of 10 April 1890 and the amendments thereto which determine the conditions for admission to a university with a view to obtaining a degree.

Technical secondary education now has as many pupils as the *enseignement moyen* and is still expanding. It was the outcome, during the past century, of local action based on the immediate economic needs of the day, and has expanded to embrace a great variety of schools. Its origin explains why it has had its own type of organization from the beginning; but as it developed it came nearer to general secondary teaching, into the structure of which it has been made to fit more and more closely in order to facilitate transfers from one branch to another. Courses on general subjects are stressed in the revised curricula. The Organic Act of 29 July 1953 has given a more unified, more rational structure to technical education. This Act deals with structures, curricula, diplomas, staff, conditions for teaching certificates, etc. The changes since made were co-ordinated by the Royal Order of 13 April 1957. Other important measures have been issued more recently, in particular the Royal Order of 1 July 1957 to regulate studies in technical secondary education.

For a long time, the legal position of teacher training was not unified. Each of its branches was defined in the organic law of the teaching for which it was intended. The Organic Act of 23 July 1952 respecting teacher training was the first to establish a legal regrouping of the three levels of teacher training: training for pre-primary (*froebelien*), primary and secondary teaching. Later provisions were co-ordinated by the Royal Order of 30 April 1957. The training of teachers for technical schools continues to form part of technical education, whereas teachers for higher secondary schools are trained in the universities.

Artistic education is being brought under regulation. An Organic Act of 14 May 1955 enumerates the categories of schools where this education is given and contains regulations applicable to teachers, inspection, grants in aid, etc.

Lastly, the Act of 29 May 1959 issued rules governing the general structure of education with the exception of higher education.

Administration

For each of the above-mentioned four branches—general secondary school, teacher training, technical and artistic education—there is a general directorate which administers the State schools where this teaching is given and maintains services for grant-aided institutions of the same category. Since 1957, general secondary education and teacher training have been placed under the same general directorate, but they keep their separate services.

The directors-general are assisted in their task by administrative services, inspectorates and *Conseils de Perfectionnement* (improvement or advisory boards). There is a board for each of the four branches (general secondary, teacher training, technical and artistic); it gives its opinion on all questions submitted to it. Its competence is limited

to State, provincial and communal institutions, and its members are appointed by the Crown.

A higher council of technical education (*Conseil Supérieur de l'Enseignement Technique*) has been set up at the Ministry of Education. It consists of representatives of major enterprises, the Ministries concerned and teachers' unions. This council has an advisory role and ensures co-ordination with economic and social interests.

The provinces and communes with fairly extensive school systems also have their own organization.

The national secretariat for Catholic education (*Secrétariat National de l'Enseignement Catholique*) ensures co-ordination and unity in all matters connected with Catholic education.

Just as the Ministry of Education is assisted by various specialized boards in the task of drawing up regulations applicable to all schools, so each educational establishment has an administrative board which proposes whatever measures are needed for its proper functioning.

Thus each official general secondary institution has a *conseil scolaire* (school board) consisting of three groups of 3 members chosen respectively from the communal council, from parents of pupils and from among persons interested in education.

Each technical school also has an administrative commission of 5 or more members. They are appointed by the Minister (in the case of State schools) or by the authority responsible for the institution (if it is an approved establishment). At least 3 of these members must represent the economic and social life of the region of the school. The purpose of the commission is to help the director in his work of management. It draws up reports on school regulations, financial matters, curricula and the equipment of the institution. It submits proposals to the Minister for the proper conduct and improvement of the school.

In technical schools, the administrative commission is sometimes assisted by a *conseil d'orientation* (guidance board) comprising specialists in the industrial trades (employers and workers) and teachers or former pupils of the school. The guidance board studies means of adapting the teaching to general or regional economic needs.

Although almost all technical education has been brought under the Ministry of Education, first through the Office of Technical Education (1932), and then directly by the creation of the general directorate of technical education within the Ministry (1946), some specialized courses are still wholly or partly subordinate to other Ministries. The teaching of child-care thus comes under the Ministry of Public Health, instruction in fishing is under the Ministry of Communications, and the *secrétariats d'apprentissage* (apprenticeship centres) (for handicrafts and other fields) are under the Ministry of the Middle Classes.

Also every state school for artistic education has an administrative commission whose powers are wide, including for example the approval of all appointments.

Supervision and inspection. The State inspects its own schools and those to which it makes grants. In the latter case, the state inspection is completed by visits of provincial, local or private inspectors, according to the rules applicable to the establishment in question.

There are 2 inspectors-general of ordinary secondary education, one for each linguistic region, together with inspectors of general (literary and scientific) courses and special courses (drawing, manual work, music, domestic work, technical and agricultural courses, etc.).

The inspectors visit each school at least once a year and draw up a report to the authorities on each teacher and each institution which they have inspected. They are recruited from both men and women members of the teaching body.

Two inspectors-general are assigned to teacher training and there are special (teacher training) inspectors for pedagogy; the other subjects are within the competence of the inspectorate of general secondary education.

Technical education has its own corps of inspectors consisting of 2 inspectors-general and various principal inspectors and specialized inspectors for technical subjects or general courses. In this branch, boys' schools are inspected by men and girls' schools by women. It is the duty of these inspectors to judge whether the teaching level is adequate, to report to the authorities on the teachers and schools and, if need be, to give advice on the purchase of whatever special equipment each school needs.

State artistic education does not come under the inspectors. The director and supervisory board are entirely responsible for each establishment under their charge. Four State inspectors (2 for music and 2 for drawing), however, visit the subsidized schools.

State inspection does not play such an important part in subsidized education, and specially in private schools, and it is much less decisive than in state education.

Finance. State-organized education is paid for entirely by the State. In certain circumstances the State also grants subsidies to provincial, communal and private institutions.

The history of these subsidies is too long and complex to be recalled here. Generally speaking, primary education and teacher training were the first to receive aid, followed by artistic education (1869 for drawing and 1881 for music), technical education and lastly, secondary education in 1951. All these measures were revised and to some extent co-ordinated by the Pacte Scolaire of 20 November 1958 and by the Act of 29 May 1959, for the application of the law on education, which carried Belgian education some distance along the road to school pluralism.

The salaries and pensions of the staff of grant-aided schools are paid by the State. These institutions also receive an operating subsidy, at a lump sum rate for each pupil (3,250 Belgian francs for secondary education, 3,750 francs for teacher training, from 3,250 to 4,250 francs for full-time technical education), as well as grants for equipment representing 60 per cent of the value of the equipment purchased.

In 1958, the annual education budget was 12,365 million Belgian francs or 11.7 per cent of the total state budget; in 1959, it was 16,198 million francs or 14.4 per cent of the total state budget.

In 1958, the state school building fund was replaced by two other funds: the fund for the construction of state schools and related buildings (Fonds de Constructions Scolaires et Parascolaires de l'État) and the fund for the construction of state buildings for higher education and

university group and communal buildings (Fonds des Constructions de l'Enseignement Supérieur et des Cités Universitaires de l'État).

The Pacte Scolaire (Act of 29 May 1959) increased the previous appropriation of 600 million Belgian francs for building secondary schools by an additional 400 million a year mainly intended for building new schools.

In addition to these funds, there is the National Study Fund (Fonds National des Études) which awards scholarships. The sums vary considerably, the average being about 4,800 Belgian francs; but the total has risen steadily, from 14,750,000 Belgian francs in 1955 to 80 million in 1959 for secondary education alone. Scholarships are awarded regularly by juries of teachers representing all types of education and all specialities. Grant-aided schools receive generous treatment.

Secondary education is as a rule free of charge. In the schools the book loan services supported by gifts or by profits from entertainments or various collections, practically ensure the supply of large numbers of textbooks free of charge. Such methods, formerly exceptional, are now spreading rapidly and tend to become general.

There used to be sharp variations in teachers' salaries, but they are becoming standardized in accordance with pilot scales. The salary of a *régent* or teacher in lower secondary education, is from 88,000 to 135,000 Belgian francs, or with the present 17.5 per cent increase, from 103,000 to 159,175 francs, after 26 years of service. The other scale, that for a teacher in upper secondary education (university degree), ranges from 114,000 to 205,000 francs, or with the present 17.5 per cent increase, from 133,950 to 240,875 francs, after 26 years of service. Salaries of teachers in special subjects follow one or other of these pilot scales according to the level.

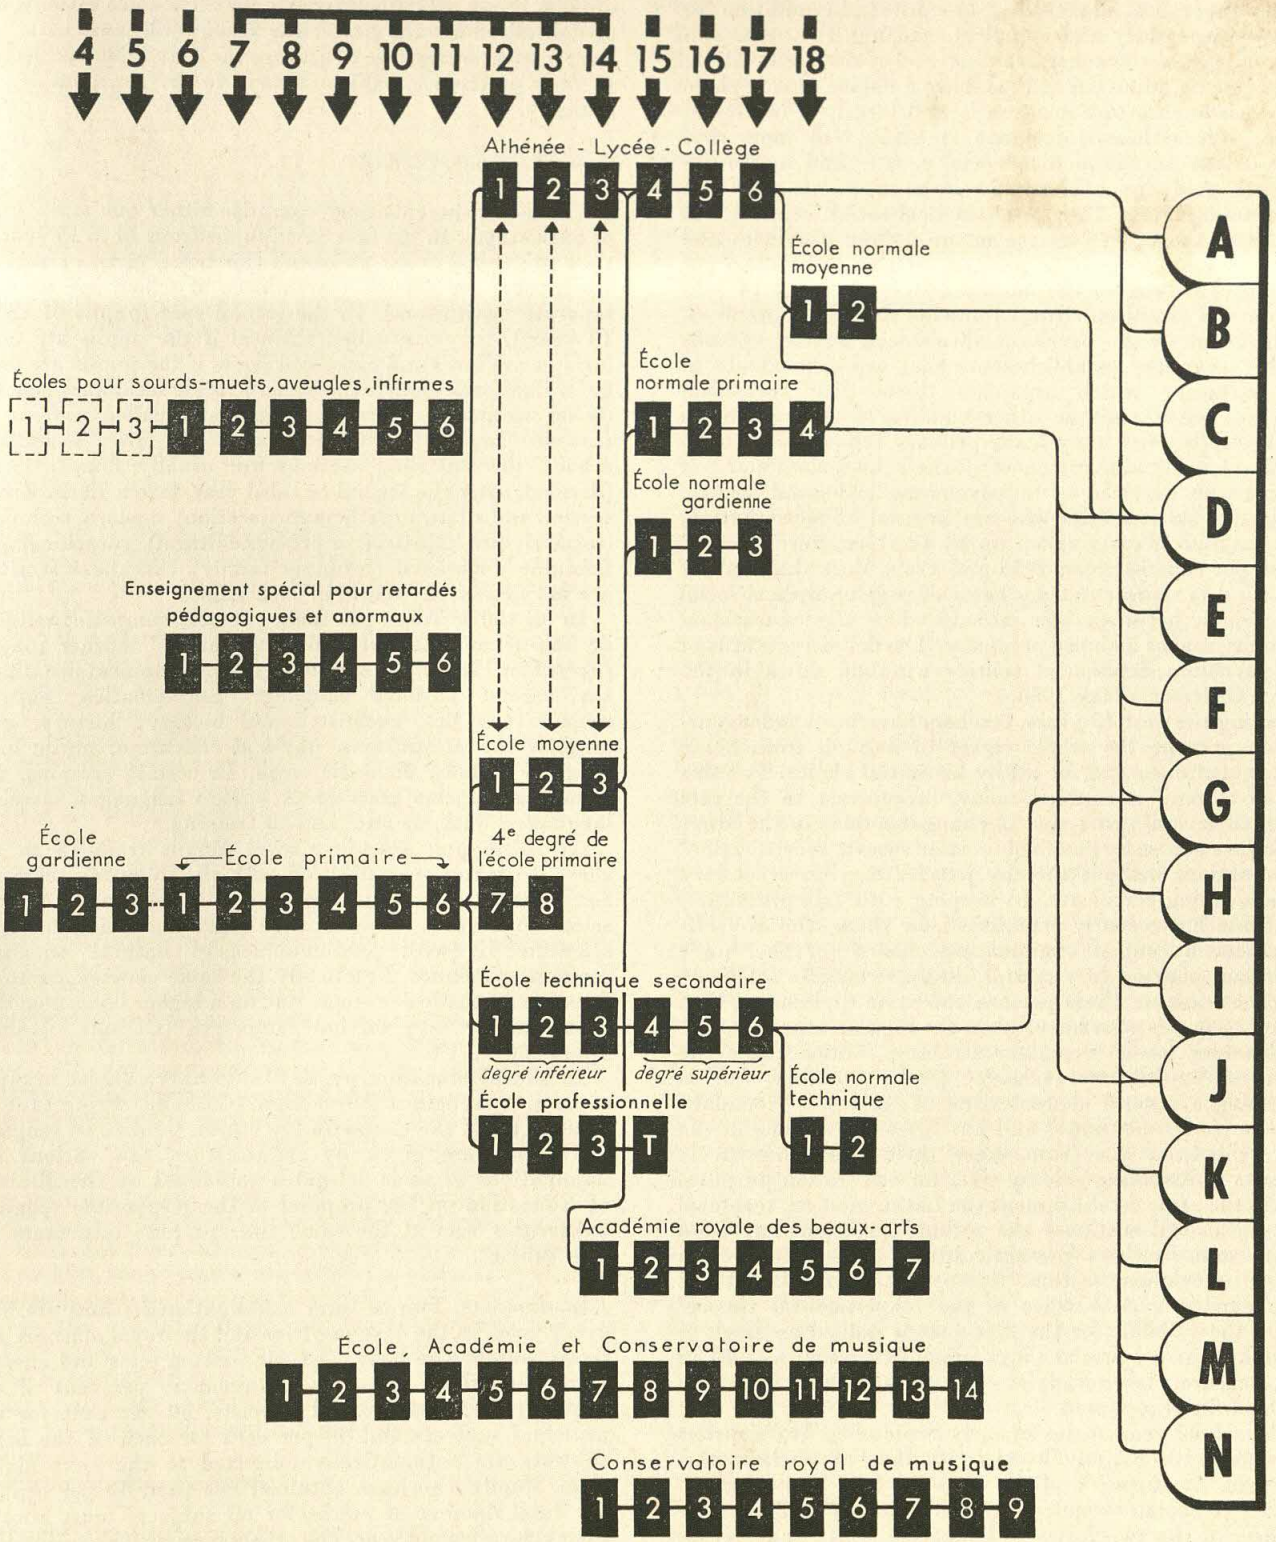
Buildings and equipment. After the war and despite the construction of many new schools, the spontaneous prolonging of school attendance, especially at the secondary level, produced an increase in enrolment and consequently a shortage of school premises. The remedies have been, not only to put up many new buildings, as mentioned above but also to have recourse to such makeshifts as mobile schools (bus-classrooms, etc.). Standardized, prefabricated installations are now being used more and more.

On the whole, there has been a great effort to make school buildings more agreeable for pupils and teachers (general arrangements, cleanliness, decoration, heating, lighting, comfort, etc.). The movement has led to reforms in boarding schools and of school restaurants; these latter are rapidly becoming generalized.

In Belgium, the Ministry of Public Works is responsible for the construction of buildings for state schools.

TYPES OF SECONDARY EDUCATION

Secondary education comprises two stages (*degrés*), a lower secondary and an upper secondary.



The lower stage includes general secondary education and technical education and the last 2 years (*quatrième degré*) of primary education. Technical training is given in the technical schools, where there is more thorough general instruction, and in the essentially practical vocational schools. After the 3 years of the lower stage of secondary or technical school, properly so-called, the pupil receives a diploma giving him access to the upper secondary cycle. Admission is not, however, guaranteed to pupils from the *quatrième degré* of primary school or to those from vocational schools.

GLOSSARY

académie royale des beaux-arts: vocational training school of fine arts.
athénée: state general secondary school for boys.
collège: private general secondary school for either sex.
conservatoire royal de musique: vocational training school of music.
école, académie et conservatoire de musique: vocational training schools of music receiving pupils from the age of 8.
école gardienne: pre-primary school.
école moyenne: lower secondary school offering both general and pre-vocational education.
école normale gardienne: teacher training school for pre-primary teachers.
école normale moyenne: teacher training college especially for teachers in the *école moyenne.*
école normale primaire: teacher training school.
école normale technique: teacher training college for vocational school teachers.
école primaire: primary school.
école professionnelle: vocational training school.
école pour sourds-muets, aveugles, infirmes: special schools for deaf and dumb. blind or crippled children with course corresponding to that of the *école primaire* and sometimes including pre-primary school.
école technique secondaire: vocational secondary.
enseignement spécial pour retardés pédagogiques et anormaux: special schools for backward and abnormal children.
lycée: state general secondary school for girls.
4e *degré de l'école primaire:* two top classes (seventh and eighth years) of the primary school providing a suitable terminal course generally with vocational bias for pupils who have not transferred to general or vocational secondary education at end of sixth year.

HIGHER EDUCATION

A. *Facultés de l'Université:* university faculties.
B. *École vétérinaire:* veterinary college.
C. *Institut agronomique:* college of agronomy.
D. *Institut supérieur de pédagogie:* institute of education.
E. *Institut universitaire des territoires d'outre-mer:* college for overseas territories.
F. *École spéciale d'ingénieurs techniciens:* special college of engineering.
G. *École technique supérieure:* technical college.
H. *Institut supérieur de commerce:* commercial college.
I. *École supérieure du secrétariat:* secretarial college.
J. *École de service social:* social science college.
K. *École nationale supérieure d'architecture et des arts décoratifs:* national college of architecture.
L. *École supérieure de navigation maritime:* college of marine navigation.
M. *École militaire:* military college.
N. *École supérieure des textiles:* college preparing for careers in the textile industry.

The upper secondary level comprises, in addition to ordinary secondary and technical teaching, the other two main categories: teacher training and artistic education.

It must be admitted that making a choice among these various branches of education is still largely a matter of chance. Nevertheless, recourse is being had more and more to the psycho-medical-social centres and to the vocational guidance offices (104 institutions in all). The State administers 28 psycho-medical-social centres and subsidizes the other services set up by the provinces and communes and by private persons. Neither the centres nor the offices belong to the administrative structure of education, and are often situated outside the school premises.

The scope of the psycho-medical-social centres extends to the secondary establishments that are subordinate to the authority which organizes them. The vocational guidance offices, on the other hand, give their attention to all pupils when they leave primary school and also to pupils of a secondary school if the school does not yet receive the services of a psycho-medical-social centre. They also assist adults who are in need of reorientation. The number of cases taken up by these centres increased by 35 per cent between 1956 and 1959. More than half of this total is represented by cases of psycho-medical-social care which occur at the periods when the educational structure makes a choice necessary. The definitive status of the psycho-medical-social centres was laid down in the Royal Order of 4 May 1956.

During the past 15 years, teachers have been endeavouring to prevent the whole career of a pupil from being determined once and for all by his initial choice. For this reason a pupil is enabled today, in contrast to the rule enforced several years ago, to change sections in the lower secondary course by passing in certain cases a 'reorientation' examination, without thereby jeopardizing his secondary school-leaving certificate. In keeping with this procedure, the State has recently established for those who are self-educated, a central examinations board for the lower secondary course (*Jury central, dit du secondaire inférieur*) which confers on these persons the same diploma as that issued to pupils who have taken the regular course.

This new lower secondary structure, which takes the form of 'multilateral schools' (*écoles multilatérales*) is becoming a general characteristic of the lower secondary schools (*écoles moyennes*) and has been in evidence in the new schools, at any rate, since their establishment. It consists of installing side by side, for orientation purposes and in the same establishment the Latin, modern, technical and vocational sections; the technical section may be a 'wood and iron' or pre-agricultural section or even a feminine technical section. Recently, the experiment has been carried even further in the 'experimental classes' where the syllabus for the first year is unified as much as possible so as to produce a common first year; as part of this measure, closer study is given to each child, for whom a school file is prepared.

The school year begins in early September. It comprises 3 terms, with holiday breaks (10 days at Christmas, a fortnight at Easter and 60 days in July and August). The Pacte Scolaire requires that the holidays shall be made uniform in the two forms of education (state and private schools). Provided that they respect the minimum number of class hours prescribed by law for all schools established or subsidized by the State, the responsible authorities of each institution are free to arrange the time-tables according to their preference, subject always to the approval of the Ministry.

General secondary schools

These establishments may comprise either one stage only or both stages. In the first case (pupils from 12 to 15 years), they are called *écoles moyennes* (for boys, girls, or mixed, when there are not enough children of school age for two separate institutions). In the second case (pupils of 12 to 18 years), they are called *athénées* if the pupils are only boys or are boys and girls, and *lycées* if the pupils are only girls. The curriculum is the same. Private secondary schools (*écoles secondaires libres*) are generally called *collèges* or *instituts*. In the first cycle, that is the lower secondary school, the following sections are usually found: Latin (divided, after the second or third year, into a Latin-Greek section and a Latin-mathematics section), modern, technical (formerly pre-industrial or pre-agricultural), vocational and feminine vocational (formerly family). All these sections are not necessarily found in each school.

In all the sections, the main subjects comprise: religion or non-denominational ethics, the pupils' mother tongue (French or Flemish, according to the geographical situation), the second national language, mathematics, natural sciences (physics, chemistry and biology), history, geography, the plastic arts, physical education, music and, in girls' schools, domestic work. In certain sections, the following subjects are added: foreign languages, classical languages, business and manual training.

At the upper secondary level (pupils from 15 to 18) there is greater specialization with the following sections: Latin-Greek, Latin-mathematics, Latin-science, modern scientific A (with predominance of mathematics), modern scientific B (with predominance of natural sciences), modern economics. Practically the same courses are to be found as in the lower stage, but on a higher level, together with one or two foreign languages (German, Italian, Spanish).

In official education, pupils always have a choice between courses in religious instruction (Catholic, Protestant or Israelite) and the course in lay ethics. Courses in religious instruction are given by ministers of the various denominations or their delegates appointed by the Minister of Education on the proposal of the responsible religious authorities who at the same time propose inspectors for this subject.

Examinations. Two or three examination sessions are held every year. In the *école moyenne* and the royal *athénées* and *lycées*, pupils who have, in their written tests and current work throughout the year, obtained 50 per cent of the aggregate of marks for all subjects, 50 per cent for the principal subjects and 40 per cent for each of the other subjects are automatically admitted to the next higher class. Pupils who have obtained less than 40 per cent of the total number of marks for all subjects must stay in their class a second year. The others may sit for a promotion examination.

At the end of the lower secondary stage, there is a final examination giving the *Diplôme d'école moyenne*. In the complete course at the *athénées* (6 years), this examination was always considered optional, but is now becoming a general practice.

The final examination at the royal *athénées* and *lycées*, as well as at *collèges*, leads to a *Certificat d'humanités* delivered by the head of the school and confirmed by an examinations board (*jury d'homologation*). The board, which consists of an equal number of teachers of private schools and teachers in state secondary schools is entitled to verify candidates' studies, but only on the basis of written evidence. The *Certificat d'humanités*, duly confirmed, entitles the student to be admitted to the university, usually at the age of 18. At this level also, the State organizes an examination by a central board, so that the same certificate may be issued to self-educated persons or to students whose schooling was irregular; this examination also enables candidates to pass certain additional tests required by the university.

Teaching staff. At the lower secondary level (*école moyenne*), the teaching staff, including the school heads, must, as a rule, hold the diploma of *agrégé de l'enseignement secondaire inférieur* (lower secondary teaching certificate). This certificate is conferred after 2 years of secondary teacher training following the secondary course itself. Candidates may choose from among the following specialities: mother tongue-history, modern languages, mathematics-physics-business, natural sciences-geography, physical education, plastic arts, domestic economy, farm domestic economy, technical subjects for women. Music teachers and religious instructors are still the only exceptions to the general rule.

At the higher secondary level, the teaching staff at *athénées* and *lycées* must hold the diploma of *agrégé de l'enseignement secondaire supérieur* (higher secondary teaching certificate) which is conferred after 4 years of university studies following secondary education. Candidates may choose among the following specialities: philosophy, classical philology, Romance philology, Germanic philology, history, physical sciences and mathematics, natural sciences, geography, physical education, business. Music teachers (who hold a qualifying certificate) and religious instructors are still the only exceptions to the general rule.

The law requires that as a rule general subjects shall be taught, in *athénées* and *lycées*, only by those who hold the higher secondary teaching certificate; for some time, however, because of the shortage of university graduates, the first 3 years of teaching in the *athénées* and *lycées* have been handed over more and more to *régents* (lower secondary school teacher) whose status is exactly the same as in the *école moyenne* or lower secondary school.

Outside the teaching itself, certain educational and supervisory tasks are entrusted to supervisor-educators (*surveillants-éducateurs*).

Teachers in state education, excepting religious instructors, are appointed under a Royal Order.

Vocational and technical schools

Through the extensive reforms applied during the past 20 years, Belgian technical education has deliberately broken with old apprenticeship traditions and broadened into a form of education that provides both a general training and a direct preparation for a specific trade.

At the present time, trade preparation is given in: technical schools properly so-called, technical sections of general secondary schools, and apprenticeship centres (*secrétariats d'apprentissage*), where it has a special, more traditional character.

In technical education, several other important distinctions must be made:

1. According to the mode of attendance: 'full-time' schools, where attendance is of the current type, are to be distinguished from 'part-time' schools for adolescents or adults who are already employed (these latter are usually open in the evening and on Sunday).
2. According to the study level a distinction is made between 'technical schools' in the strict sense, where the level is comparable with that of secondary education, a condition which makes it possible to give a fairly advanced theoretical and scientific training (and so such schools often prepare for higher studies), and 'vocational schools', where the level of theoretical study is not so high but more emphasis is placed on practice.
3. Technical education, like the corresponding general secondary school (see diagram on page 237), is divided, according to degree, into lower technical secondary school (3 years of technical studies equivalent to the 3 years of lower secondary school, or 3 years of vocational studies, with an extra final year in some sections) and higher secondary technical school (3 years of study for pupils from 15 to 18 years). In technical education, properly so-called and in vocational education, each of these two degrees may be supplemented by a year of more advanced work during which the pupil completes his specialization.
4. Lastly, according to the category to which they belong and the special branches for which they prepare, technical schools vary greatly. In particular, there are: industrial and craft schools (principally metal work, electricity, woodwork, but also mining industries, building, chemistry, bookbinding, textiles, clothing, leather, food, hotel-keeping); commercial schools; agricultural schools; schools for home economy, women's occupations and nursing; schools of applied arts; schools preparing for the para-medical professions (very few at secondary level); schools for maladjusted pupils.

Curriculum. According to law, the King decides on the minimum curriculum common for both state and approved institutions. The curriculum enumerates the subjects to be taught, determines the level to be reached and establishes a time-table for each type of institution. However, the authorities of each school can employ at least 20 per cent of the maximum authorized time-table in order to achieve a better adaptation of the teaching to the particular aims of the establishment.

On the advice of the Higher Council, the Minister issues time-tables to serve as guides to the different sections.

Theoretical teaching is limited to a weekly maximum of 30 lessons of 50 minutes each. The weekly course in full-time technical schools must include at least 28 lessons of

50 minutes. The weekly maximum may not exceed 36 lessons for first-year pupils and 40 lessons for the others (most schools apply the maximum time-table). In the lower secondary cycle of technical schools, a certain number of lessons (20 to 28) are given over weekly to general training, including religious instruction (Catholic, Protestant or Israelite) or non-denominational ethics and civics, the pupil's maternal language, history, geography, mathematical sciences, natural sciences, physical training, musical education and education in the plastic arts. In the higher secondary section, from 18 to 30 lessons a week are given over to general training, which includes the second national language in addition to the subjects enumerated above. In vocational schools, much less room is given to theoretical training after the pupil is 14.

For some time a great effort has been made to get technical education out of its isolated position. Today, a pupil in technical school who does not feel he is taking the right course may transfer not only to vocational school, where there is less theoretical training, but even to general secondary education, after a reorientation test. Transfers are made from general secondary to technical school under the same conditions.

Teaching staff. The teachers in a technical school include a head, teachers for general subjects (working under the same conditions as their colleagues in other types of institutions, except that instructors may also teach in vocational sections) and specialized teachers (technicians preferably recruited from among holders of diplomas for technical teaching who have had professional experience). The recruitment age limit for teachers is 50 years.

For girls, technical teacher training already exists and covers feminine specialities (domestic economy, dressmaking, decorative arts) as well as business. For young men, most of the teacher training courses are part-time; however, there are two full-time state teacher training sections at Morlanwelz and Deurne.

Teacher training schools

At the higher secondary level, teacher training schools include schools for pre-primary teachers, which prepare for teaching in the *écoles gardiennes* (kindergarten) and are reserved for girls, and schools for primary teachers which train primary schoolmasters and schoolmistresses.

Each teacher training establishment has a practice school where its pupils may obtain experience in teaching.

Until 1957, these normal schools always had an autonomous curriculum based to a great extent on that for the humanities in general culture, but in which after the second year the special needs of teaching took first place. Since the reform measures, schools for kindergarten and primary teachers have had a 4-year course after lower secondary school.

Schools for kindergarten teachers have again found a certain degree of autonomy; they have their own time-table and curriculum. In primary teacher training the programme for the first 2 years is made to correspond with that of secondary education; work of a pedagogic character is left to the last 2 years, where it fills one-third of the time-table. General subjects are entrusted to teachers with qualifications similar to those of their colleagues in secondary school; they are remunerated on the same scale.

Primary teacher training studies lead to a twofold diploma, the schoolmaster's diploma and the certificate for the corresponding section of the humanities.

Schools for artistic education

Artistic education is now being reorganized and rationalized; it includes musical education and the teaching of the plastic and graphic arts.

Music education is intended not only to train professional musicians but also to give many amateurs a general introduction to music. The courses are given in 5 royal schools of music (state institutions), in communal schools of music and academies and schools of music (grant-aided institutions).

Teaching in the plastic and graphic arts comprises three sections: architecture; painting, sculpture and engraving; decorative arts.

TRENDS AND PROBLEMS

The first problem which secondary education faces today and will continue to face in the coming years is certainly the increase in the school population and in the enrolment rate. These movements, however, affect in the main the general secondary and technical schools which attract the largest number of pupils from 12 to 18 years of age, whereas the other branches remain fairly stable. According to present forecasts, the enrolment in various types of secondary education, which stands at present at 428,229 pupils will amount to 600,000 pupils about 1965. This figure may even be exceeded if the period of compulsory school attendance is extended. This expansion of education doubtless entails many difficulties as regards financing, equipment and staff. It is, however, to be welcomed, first, from the social standpoint, since it is evidence of better opportunities for the young, secondly, from the economic angle, because the fact is becoming more and more obvious that better qualified young people represent a real investment, of profit to the whole community.

The second problem, which is linked to the first, is that of making studies more democratic. A series of measures must be carried out in order to give children access to education which suits the tastes and aptitudes of each child and to prolong such teaching as long as possible. Such a policy involves doing away with many obstacles of a financial, psychological, pedagogic, legislative and social character which too often prevent children from following their own natural bent.

In this respect, many measures have been adopted and are being applied: the number and value of the scholarships has been increased; the structure of secondary education which was considered too rigid has been made much more flexible and now allows, under specific conditions, for reorientation in the middle of the course of study; curricula are being carefully revised; many teaching experiments are being made. Serious efforts are also being made to find new patterns for the valid vocational and human training of pupils whose aptitudes are mainly practical. In short,

the whole of secondary education is evolving and is under the impact of the profound transformation of the modern world. One of the consequences of this movement has been the reopening of the discussion concerning the conditions of admission to higher education, with a view to a wider recruitment of students.

Lastly, the *Pacte Scolaire* has provided a new solution to a problem which, for many years, has had a profound influence on the social and political life of the country: that of the coexistence of official and private education. This agreement, concluded between the three main political parties on 20 November 1958 and put into effect by the Law of 29 May 1959, tends to put the two forms of education on an equal footing. It is mainly concerned with the rights of the public authorities and of private bodies with respect to education and with the salaries and pensions of staff and grants for the conduct of schools. Moreover, for the greater benefit of education, the *pacte* provides for an extension of the compulsory school age, free primary and secondary education and an extension of the scholarship system. It also makes provision for special credits for the construction and equipment of official educational establishments.

STATISTICS

Population (mid-year 1958 estimate): 9,053,000.
Area: 11,779 square miles; 30,507 square kilometres.
Population density: 769 per square mile; 297 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, school enrolment exceeded 1.8 million pupils, which represented about one-fifth of the total population. Of these pupils, about 20 per cent were in nursery schools, 48 per cent in primary schools, 14 per cent in general secondary schools, 16 per cent in vocational schools, less than 1 per cent in secondary-level teacher training schools, 2.4 per cent in higher education, and 0.6 per cent in special schools. The proportion of girls was 49 per cent in nursery schools and primary schools, 45 per cent in general secondary schools, 41 per cent in vocational schools, 67 per cent in secondary teacher training schools, and 27 per cent in higher education. Between 1953 and 1957, primary school enrolment increased by 24 per cent, and secondary enrolment by 13 per cent. (See Table 1.)

Enrolment trends in secondary education. For lack of comparable data for periods before 1953, it is not possible to show the trends in pupil enrolment at the secondary level of education. For the period 1955–57, total enrolment in general, vocational and teacher training secondary schools, including part-time students, averaged 517,000 which represented 92 per cent of the estimated population 15–19 years old.

Examination results in secondary education, 1953–57. Between 1953 and 1957 the number of pupils who passed the general secondary examinations increased by 23 per cent. Girls received one-fourth of these certificates in 1957/58. Between 1953 and 1956 the number of vocational certificates increased by 17 per cent, and the number of teaching certificates by 29 per cent. Girls received all the certificates for kindergarten teachers, and 60 per cent of the certificates for primary school teachers in 1956/57. (See Table 2.)

Educational finance, 1957. For the fiscal year which began in January 1957, the budget of the Ministry of Education amounted to 11,282 million Belgian francs, averaging 1,255 francs per inhabitant. In addition, some 2,000 million francs were spent by the *communes* and a further 650 million francs by the provincial authorities. Data are not available on expenditure for private education, or for public education not under the Ministry of Education. (See Table 3.)

Note. Precise data for receipts by source concerning the financing of education are not available. The total receipts of the Central Government, the provinces and the *communes* are paid into the Treasury (from various taxes and fees) forming a general budget and it is not possible to specify the exact source of funds covering educational expenditure.

1. Official exchange rate: 1 Belgian franc = 0.02 U.S. dollar.
2. Budget estimate of the Ministry of Public Instruction only. In addition, *2,000 million francs were spent by the *communes* and *650 million francs by the provinces. Data concerning expenditure by Ministries other than Education and by private educational authorities are not available.
3. In addition, a certain amount was reserved for education from the total sum of 362 million francs allocated for construction and alterations of state-owned buildings.
4. Includes special education.
5. Includes higher vocational education.
6. Not including higher vocational education.

BELGIAN CONGO

THE EDUCATIONAL SYSTEM

The first schools proper in the Independent State of the Congo were opened in 1906. In that year, a school for clerks (*école de candidats-commis*) was opened at Boma, a decree was issued establishing industrial vocational schools attached to the state workshops at Boma, Leopoldville and Stanleyville, and a convention was concluded between the Independent State of the Congo and the Holy See, whereby each establishment run by the Catholic missions undertook to open a school for Africans, in accordance with a programme drawn up in agreement with the Governor-General. Protestant mission schools were also established and contributed largely towards eradicating illiteracy and educating the people.

In 1908, when the Congo was ceded to Belgium, Article 2 of the Law of 18 October 1908, relating to the Government of the Belgian Congo, proclaimed the freedom of education: 'Private instruction shall not be restricted; all measures interfering with it are forbidden; the repression of offences shall be regulated by law.'

Pursuant to these legal provisions, the following schools were opened: state schools, established and administered by the public authorities; official congreganist schools, established by the public authorities and administered by private associations; government-aided private schools; private schools receiving no aid from the public authorities and completely independent of the latter.

The teaching was mainly utilitarian, for it had to meet the primary needs of a community in process of organization. It was essential to train clerks, semi-skilled workers, instructors (*moniteurs*) for the primary school classes and for the local agricultural services (*moniteurs agricoles*).

At this initial stage, educational development was closely combined with missionary work; it was thanks to the religious missions, which were protected and encouraged by the State, that literacy and elementary education were gradually extended throughout the country.

During the 1914–18 war, the question of education inevitably took second place, but immediately afterwards the Minister in charge, Mr. Franck, resolved upon a first systematic study with a view to evolving a plan of action for the wide extension of education and the improvement of its quality. In 1922, a commission was set up for that purpose. It emphasized in general that the curricula and teaching methods should be more closely adapted to the environment, that priority should be given to strictly educational efforts, that instruction should be given preferably in the vernacular languages, that fundamental importance should be attached to teacher training and that the religious missions should be asked to co-operate in the promotion of education. In 1929, effect was given to these recommendations by a first series of regulations, which fixed the main structural features of the African educational system and launched it vigorously upon its course.

During the following years, however, these regulations were to be considerably modified and adapted. They were thoroughly revised by the regulations of 1948 and were again modified in 1952. Since then, the structure of the educational system has undergone further important innovations and modifications: a considerable extension of state education and of teaching in French for Africans; the gradual 'inter-racialization' of schools; the spread of technical education; the opening of several social schools; the provision of specialized training for administrative officials, and lastly, the development of university education. These modifications and additions to the structure of education call for a new and comprehensive set of official regulations defining the State's educational policy; these regulations are now being prepared.

The vocational training schools established by industrial and agricultural associations have also made great strides.

Educational development is closely related to economic development at its different levels. This has led the Government to make a clear distinction between schools designed to promote the progress of the rural inhabitants by facilitating the establishment of a class of independent artisans within rural communities, and schools opened for the benefit of industrial, urban and non-tribal communities. Rural economy must evolve if it is not sooner or later to disappear, for the rural population would inevitably be attracted towards the centres with their higher standard of living. But because artisans, recently trained in trade schools, are usually unable to set themselves up at their own expense, 'social workshops' have been created (similar to co-operatives), in which rural tradesmen can complete their training within a tribal environment. In an industrial, urban and non-tribal environment, the organization of vocational training does not raise so complex a problem.

Agriculture as now practised by most of the indigenous population has not yet become a truly 'professional' activity; it has hardly passed beyond the subsistence stage. In the provision of agricultural education, a distinction must be made between the agricultural training of rural youth and the training of agricultural instructors.

The training of young farmers is promoted by the general primary schools, thanks to agricultural guidance centres. The Government hopes that these will eventually produce a class of small independent farmers, in possession of land of their own. As early as 1908, an agricultural school was established by the Government-General to this end. There are also farm schools which enable young people to improve their primary agricultural training if they so desire.

The task of the agricultural instructors is to train the adult members of the rural population. As a rule, their activities are rather scattered, but they tend more and more to concentrate their efforts on organizations known as *paysannats*, which were created for the purpose of rationalizing the use of land and increasing farmers' output,

and which have their own producers' co-operatives. The first school for *moniteurs agricoles* was established in 1926.

So far, the main objectives of the network of agricultural secondary schools established (since 1938) throughout the Belgian Congo have been to train those responsible for branches of agricultural propaganda, the assistants attached to the *paysannats*, and the crop and plantation supervisors of private companies. The agricultural instructors in charge of local activities pursue their studies (2 or 3 years) at the secondary level in agricultural vocational training schools. The agricultural assistants, who directly aid the Government agricultural propaganda services, receive technical instruction (4 years) in the higher secondary schools; their functions are more far-reaching and more responsible.

Since 1912, in addition to a network of schools for the African population, the Government has had to provide for the instruction of young Europeans. At that time, this question was quite separate from that of instruction for Africans, for the Europeans concerned were the children of settlers, civil servants and representatives of private firms, who had already received part of their education in Europe or were at least intended to continue their studies there.

Hence the dualism still to be found in the educational system of the Belgian Congo. Alongside schools providing instruction for Africans in accordance with curricula designed to promote the assimilation of the local inhabitants were schools for European children, who were taught in accordance with the curricula applied to Belgium. Until a few years ago, these two types of instruction developed independently of each other.

However, with the general development of the country and the extension of education, the level of the schools for Africans gradually rose to such an extent that, in some cases, it approached very closely—and even equalled—the level of the schools for European children. Since then, the Government, abandoning discrimination, has resolutely sought to suppress all forms of school segregation. Every year an increasing number of Congolese attend schools which but lately were open only to European children.

In Brussels, the Ministry for the Congo and Ruanda-Urundi has a directorate of education comprising four sections. Its services are concerned mainly with research with a view to working out the school policy to be applied in Africa.

In the Belgian Congo, the administration and general control of education are entrusted to a Directorate-General of Education, consisting of four Directorates: Directorate of Primary Education and Teacher Training, Directorate of Secondary and Higher Education, Directorate of Technical and Agricultural Education and a Directorate of School Inspection. Each of these Directorates is subdivided into sections and offices, each having its own special and well-defined tasks. In each provincial capital there is an educational service under the Governor of the province. Each service can take the initiative at the provincial level and is responsible for the execution and supervision of the directives issued by the Government-General. Its staff includes primary school inspectors.

Large private companies or associations (mostly mining and transport concerns or religious associations) set up and administer their own schools and bear all the costs. Such schools are mainly at the primary or post-primary level, and are usually organized to meet the needs of the founder organization.

The diagram on page 247 shows the structure of the educational system in the Belgian Congo.

GLOSSARY

NOTE. The arrows indicate various possibilities of transfer from general to technical education.

classe de liaison: transitional primary class enabling pupils to transfer from the ordinary upper primary school to the selective (pre-secondary) upper primary schools.

cycle secondaire inférieur: lower secondary stage.

cycle secondaire supérieur: upper secondary stage.

cycle supérieur (projet): advanced technical stage (projected).

école artisanale: vocational training school for rural trades.

école d'apprentissage: vocational training school for industrial and urban trades.

école d'apprentissage pédagogique: teacher training school for teaching assistants in the *école primaire du Ier degré.*

école d'auxiliaires: vocational training school for clerical and administrative assistants.

école ménagère périprimaire: homecraft school with courses, adapted to local conditions, at lower primary level (*Ier degré*) for girls who have never attended school and are above school age, and at upper primary level (*2e degré*) for older girls who have not completed primary school.

école ménagère postprimaire: post-primary vocational training school in home economics with courses adapted to local conditions.

école moyenne de moniteurs: teacher training school for teachers in lower primary and ordinary upper primary school.

école moyenne ménagère: vocational secondary school of home economics.

école normale secondaire: teacher training school for teachers in selective upper primary schools.

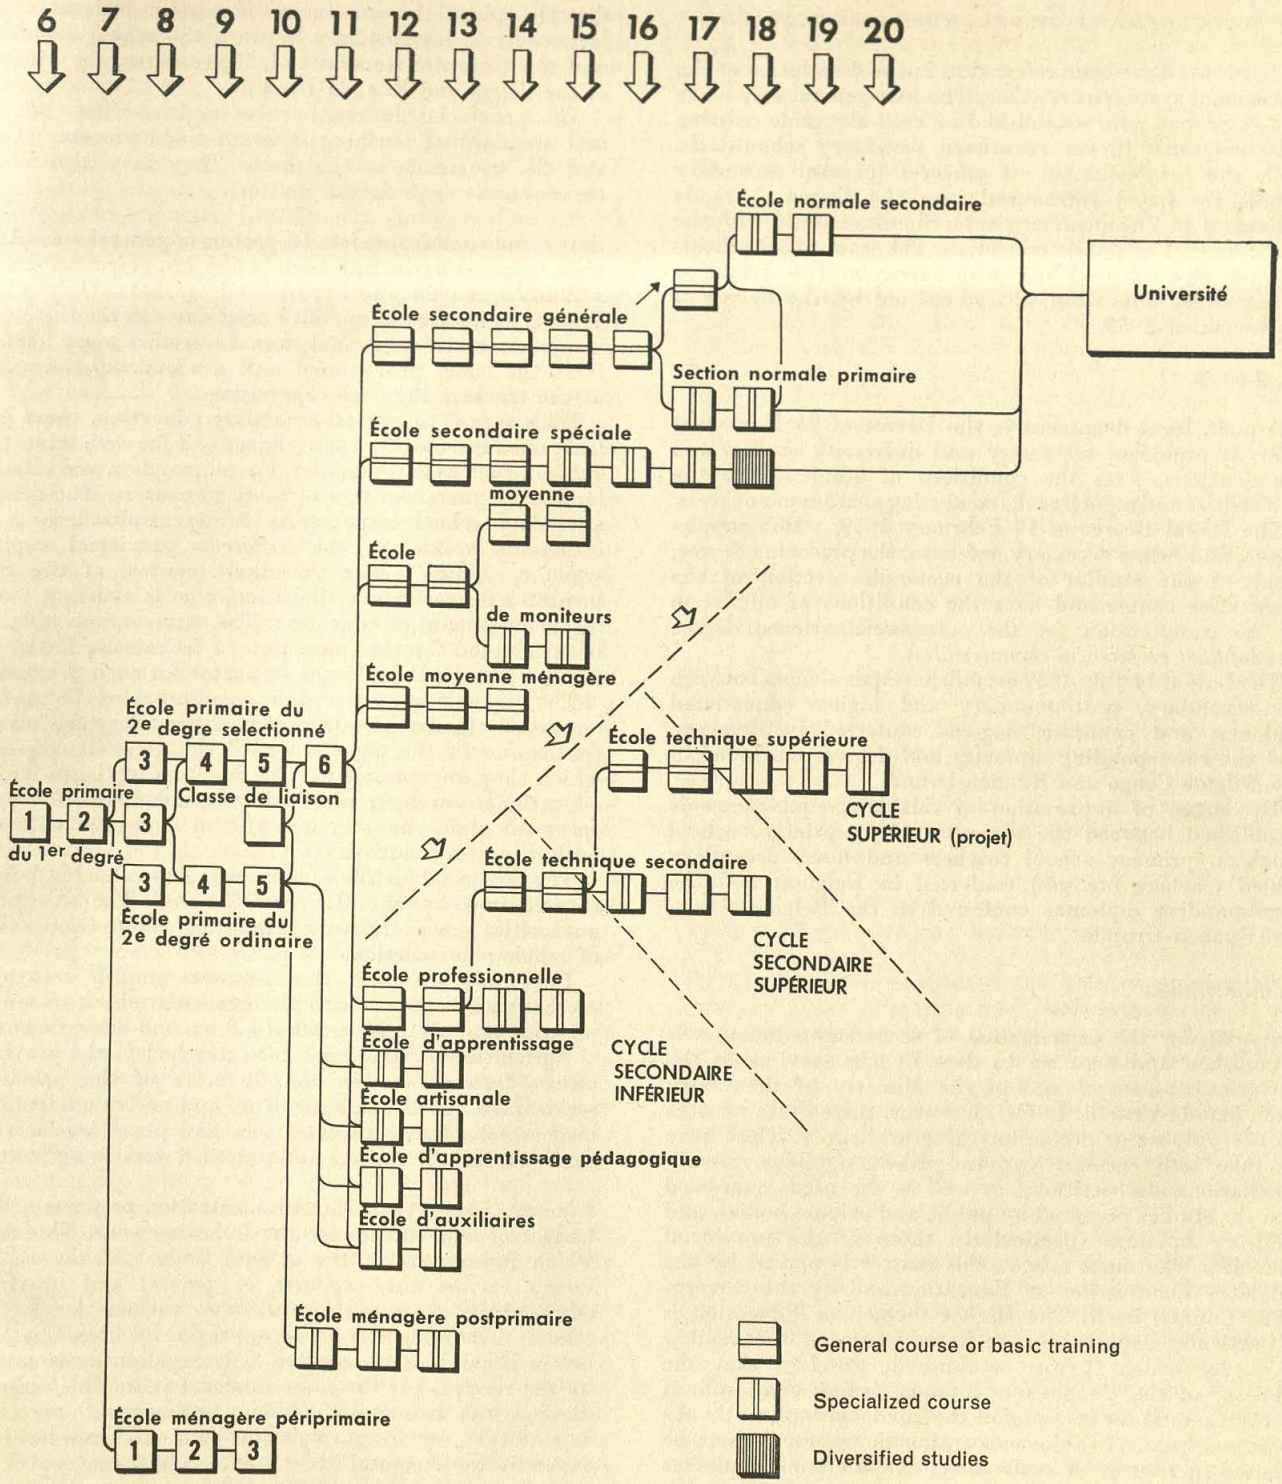
école primaire du Ier degré: lower primary school.

école primaire du 2e degré ordinaire: ordinary upper primary school, usually leading to vocational training but with possibility of access to general secondary education after a year's extra study in a *classe de liaison* or *classe de 6e préparatoire.*

école primaire de 2e degré selectionné: selective upper primary school leading to general or vocational education at secondary level.

école professionnelle: vocational training school.

école secondaire générale: general secondary school.



école secondaire spéciale: secondary school organized in two cycles, the lower cycle providing general education, the upper preparing for careers in commerce, administration, surveying agriculture, teaching, physical education, medical and veterinary sciences.

école technique secondaire: vocational secondary school of technical training.

école technique supérieure: vocational school providing advanced technical training.

section normale primaire: teacher training section in secondary school.

université: university.

THE DEVELOPMENT OF SECONDARY EDUCATION

Early events have been referred to in the description of the educational system as a whole. The first general secondary schools proper were established in 1948 alongside existing *écoles moyennes* (lower vocational secondary schools). In 1955, the establishment of *athénées* (general secondary schools for boys) introduced into the Congo curricula equivalent to European curricula. Simultaneously with the establishment of public education, the grant-aided schools (*collèges*) also adopted European curricula. This evolution of secondary education was completed by the decree of 25 November 1958.

Legal basis

The main legal document is the Decree of 25 November 1958; it organizes secondary and university studies and examinations, fixes the conditions of admission to the universities and regulates the conferring of academic degrees.

The Royal Decree of 17 February 1959, which supplements, and, when necessary, refers to, the preceding decree, regulates the studies of the economics section of the humanities course and fixes the conditions of admission to the examination for the commercial science degree (*candidature en sciences commerciales*).

The Law of 14 July 1959 establishes equivalences between the secondary, post-secondary and higher educational diplomas and academic degrees conferred in Belgium, and the corresponding diplomas and degrees conferred in the Belgian Congo and Ruanda-Urundi.

By virtue of a provision of this law, equivalence is established between the diplomas of pre-primary school teachers, primary school teachers and lower secondary school teachers (*agrégés*) conferred in Belgium and the corresponding diplomas conferred in the Belgian Congo and Ruanda-Urundi.

Administration

The plan for the organization of secondary education is established and kept up to date by the services of the Government-General and of the Ministry of the Congo and Ruanda-Urundi. In fact, however, these State services do not propose or decide anything arbitrarily. They have to take into account various wishes, opinions, recommendations and petitions, as well as the needs expressed and the studies prepared by public and private bodies, and advisory opinions (particularly those of the provincial councils). The main role in this matter is played by the Advisory Commission on Education and by the Government Council itself. The Higher Council of Education is of particular importance; the Royal Decree of 8 November 1954, by which it was established, provides that the Minister of the Congo and Ruanda-Urundi shall submit to the Council for its opinion the curricula and textbooks to be used and the rules concerning the exemptions to be granted in respect of nationality, examinations, diplomas and certificates.

Control. At the head of each public secondary school there is a director (*directeur* or *préfet d'études*), who comes directly under the provincial education authority. The latter acts as intermediary between the school concerned and the Governor-General and, if necessary, the Minister of the Congo and Ruanda-Urundi.

The provincial authorities also supervise the curricula and standard of teaching in grant-aided private schools and the use made of the grant. They may also advise these schools on technical matters.

Supervision and inspection. Inspectors of general secondary, technical and agricultural education are recruited among suitably qualified and experienced teachers. Only where there is a shortage of qualified candidates in the Congo are inspectors recruited in Belgium. Inspectors must have at least the same professional and academic qualifications as the teachers they are supervising.

With regard to general secondary education, there is at least one inspector for each subject and for each important subject, such as mathematics, French, modern and classical languages, there are two or more inspectors. The general secondary school inspectorate is decentralized, i.e., the inspectors reside in the different provincial capitals while remaining under the direct control of the chief inspector for secondary education, who is assistant to the inspector-general of education. The same organization has been adopted for the inspection of technical schools, but for this branch there is one inspector for each province.

The inspector-general and the chief inspector of secondary education organize the inspection of secondary schools and participate in the supervision of the general courses in which they are specialists. The directors of the provincial educational services, although not members of the inspectoral staff, may, in exceptional cases, be entrusted with inspectoral duties.

The territorial jurisdiction of secondary school inspectors is delimited by the Governor-General. The missionary authorities are exclusively responsible for the supervision of religious instruction.

Inspectors see to it that teachers employ recognized methods and comply with the curricula, check on pupils' progress and also give general advice and encouragement.

Agricultural school inspectors attached to the provinces ensure liaison between the directors of the provincial services for education, agriculture and native affairs. They inspect schools, of all categories and at all levels, whose curricula include courses and practical work in agriculture.

Finance. Every year, the Administration prepares a draft budget of expenditure for the following year. This draft, which forms part of the general budget of the Belgian Congo, covers the expenses of general and provincial administration, inspection at the various levels, and schools. The budget must be approved by both Chambers before it can be implemented. The expenditure is covered by the receipts for the same financial year. The budget is divided into two main sections: ordinary or operational expenditure, covering a calendar year, and extraordinary expenditure or capital investments, which may cover two calendar years. Education has its own revenue, which accrues from school fees, boarding fees, etc. but these receipts are extremely small compared with the expenditure, for school education is almost entirely free of charge.

Private vocational training schools (trade and agricultural schools), however, derive revenue from the workshops, gardens, plantations or cattle-breeding farms attached to them.

The General Administration has control of the funds for the remuneration of teachers, whose salaries are paid monthly in advance. Some of these funds are allocated to the state schools and to the official congreganist schools, which thus administer them directly. This procedure enables the schools to meet certain local expenses and to pay their non-teaching staff without need of an intermediary.

At the beginning of each financial year, private schools receive an advance equal to 80 per cent of the previous year's grant. The balance is paid after discussion of the annual report.

State schools are constructed at government expense wherever they are needed. The costs of the construction and equipment of official congreganist schools, which remain the property of the State, are also borne entirely by the Government, as far as capital investments are concerned. With regard to private schools, the Government pays a large part of the costs of their construction and equipment, provided they have been officially recognized. This preliminary recognition depends on the number of schools actually needed in the region. In large centres, the State defrays 80 per cent of the expenditure. Outside the large centres, the grants made for the construction of primary schools represent 70 per cent of the expenditure, those for the construction of secondary schools 80 per cent.

Teachers in state schools are civil servants and are appointed by the State; they are governed by the rules established by the Administration for its staff in general and by the special rules relating to educational services. Their rate of pay depends on their academic qualifications and the nature of their services, the latter being determined by the former. In addition to their salaries proper, they receive substantial allowances: cost-of-living allowances, family allowances, all varying with length of service and the reports of their supervisors.

Teachers in grant-aided private schools enjoy the same advantages; but there is a difference between lay teachers and teachers belonging to religious orders. European lay teachers are entitled to the above benefits provided they do not constitute more than two-thirds of the total number of teachers in any of the secondary schools, except in the case of technical, vocational, agricultural, medical, and apprenticeship schools, where the entire staff may consist of lay teachers.

Subventions payable in respect of teachers belonging to religious orders are limited to a smaller proportion of the staff.

There are usually no tuition fees for secondary education and pupils have only to pay for school books and other necessary school materials. In some schools which possess a stock of books, the latter are loaned for a small charge, and even free of charge to needy pupils. But free education is not extended to pupils whose parents are well-to-do; the latter must pay school fees and purchase school books and other necessary school materials. In principle, parents must pay boarding fees, but in fact, most of them are granted considerable exemptions and bear only a small part of these fees.

Buildings and equipment. School buildings are erected in healthy localities in the centres they serve, or as near to them as possible. They are constructed so as to benefit from the coolness accompanying the prevailing winds. Schools may not be constructed near markets or other places lacking the peace and quiet necessary to efficient teaching. The size of the building site, classrooms and other premises is proportionate to the number of pupils, due regard being had to future needs. To ensure efficient teaching, however, the number of pupils per class must not exceed a certain figure.

On the basis of this maximum number of pupils per class, standard dimensions have been established in accordance with the following rules: each classroom must be rectangular in shape and, as a rule, its length must be six and a half feet greater than its width; its area is calculated on the basis of 13 square feet per pupil; it must be at least 13 feet high, and each pupil is entitled to 176.5 cubic feet of air.

Many schools, particularly vocational and technical schools, are equipped with showers. In technical schools, the rooms for theoretical teaching must satisfy the above-mentioned conditions, whereas the rooms for practical work (laboratories) are planned to meet the special needs of the particular subject.

School welfare services. Once a year, schools are visited by a doctor who examines the pupils and prescribes the necessary treatment. The most serious forms of illness, whether epidemic or not, particularly tuberculosis, malaria, sleeping sickness, diseases due to intestinal parasites, skin diseases and malnutrition, are the object of special medical control. Medical attention and medicaments are free of charge to teachers and pupils.

TYPES OF SECONDARY EDUCATION

Pupils who have completed the third-year class of the ordinary upper primary school (*école primaire du 2e degré ordinaire*) have access to post-primary schools, where the teaching time is shortened: *école d'auxiliaires* (school for clerical assistants), *école d'apprentissage pédagogique* (student teachers' training school) and *atelier d'apprentissage artisanal* (trade apprenticeship school), *école ménagère post-primaire* (post-primary home economics school), as well as schools which provide training for medical and veterinary assistants, agricultural instructors, etc.

After completing the fourth-year class of the selective upper primary school (*école primaire du 2e degré sélectionné*) pupils may choose between the various branches of general and special secondary education, schools for *moniteurs*, vocational and technical schools for nurses and midwives, etc.

The most gifted pupils who have completed the third-year class of the ordinary upper primary school have access to classes similar to the selective upper primary school classes, namely, the sixth and seventh preparatory classes.

Pupils and parents are guided in their choice of a branch of secondary education; older pupils are advised to undertake studies of short duration, and account is also taken

of the pupils' aptitudes. By offering judicious advice, teachers, headmasters and inspectors assist pupils and parents in making their choice. In the Congo, the school vocational guidance service, assisted by a psychotechnical service, is still in its infancy. It has already aided various schools to draw up a systematic programme, based on scientific experimentation, with a view to advising parents, pupils and teachers.

Organization of the school year

In the Congo, the school year begins at the end of August or during the first fortnight of September and closes at the end of June or during the first fortnight of July. In order to facilitate transition from one school to another, it has been standardized and is divided into three terms, each of which is followed by holidays: 10 to 15 days at Christmas and the New Year, a fortnight at Easter and approximately two months' summer holidays in July and August. At certain schools, there is a break of two or three days in the school term, particularly if it is long. The schools also observe public holidays.

The school week begins on Monday morning and ends on Saturday at noon: often there is a half-holiday on either Wednesday or Thursday afternoon. The lessons proper usually begin early in the morning; they are sometimes preceded by prayers, manual work and half an hour's preparatory study. Each lesson lasts from 45 to 60 minutes. Lessons requiring the greatest mental concentration are given at the beginning of the morning or immediately after a recess period. The afternoons on which there are no classes, and Sundays and other holidays are devoted to revision, the preparation of examinations, sport, leisure activities, walks, excursions, etc.

General secondary schools

General secondary education is in process of reorganization and the curricula are being improved with a view to facilitating admission to the university. This important reform, begun some years ago, was given a legal basis by the decree of 25 November 1958, which regulates the conferring of academic degrees. Secondary schools will henceforth teach the classical and modern humanities. Each of these parallel branches of teaching is divided into two stages, lower and upper. For the modern humanities, the lower stage is the same for all pupils and the upper stage is divided into an economics section, a scientific section A and a scientific section B. The classical humanities are subdivided into the Latin-Greek section, the Latin-science section and the Latin-mathematics section. After successfully completing these two stages, the pupil receives the Humanities Certificate, which qualifies him for immediate admission to most of the university faculties and schools, and other institutions at the higher or post-secondary level.

Secondary school pupils are recruited by competitive examination in the main subjects taught during the last year of primary studies. The capacities, aptitude and age of each candidate are also taken into consideration.

The pupils' work—lessons, home-work, exercises, personal research—is controlled by daily appraisals and by terminal examinations. It is the total result—i.e., the sum of the terminal results—which determines whether the pupil is entitled to promotion from one class to another. According to the importance of the subject, the pupil must, in general, obtain 6, 5 or 4 out of 10 in order to be promoted. The pupil must also obtain a satisfactory average mark for his work as a whole, namely 5 out of 10. The terminal examinations are written and oral. In the higher classes, greater importance is attached to the oral examinations than in the lower classes. Teachers draw up reports not only on the pupil's school progress but also on his social behaviour. At the end of each stage, a final examination is held and the board of examiners issues a certificate or diploma to the successful candidates.

If a pupil fails to obtain a pass in a particular subject, he must sit for a further examination (*examen de passage*) at the beginning of the following school year. If he fails to pass in too many subjects, he must remain in the same class for another year, or he is sent to another type of school corresponding more closely to his particular aptitudes and intellectual abilities.

On the same level as the general secondary schools there are special secondary schools which provide training for administrative assistants, clerks and typists, medical assistants, health assistants, veterinary assistants, agricultural assistants, men and women nurses, midwives, foresters, veterinary officials, health officials, agricultural instructors (*moniteurs*), etc.

Vocational and technical schools

In the Belgian Congo, vocational and technical education is all at the secondary level. The original curricula, which took into account the fact that many of the pupils had not completed their primary schooling, can now be revised so as to attain the level of courses in Belgium. However, one important distinction must still be made in the organization of technical education. Whereas the vocational schools designed to meet urban and industrial needs are rapidly approaching European standards, the schools which train artisans for rural districts are handicapped by the fact that tribal customs change slowly. Social centres and *paysannats* (see above), where agricultural work is planned, offer trainees of the trade schools a protection they do not get from the traditional social environment and provide a market for their products.

Boys' vocational training schools. The trade schools (*écoles artisanales*) are open to pupils who have completed 5 years' primary education. The object of these schools is to train artisans for rural areas. Most of them are organized and run by missionaries and teaching is almost entirely in the vernacular. At the same educational level, farm schools (*fermes-écoles*) also encourage young people to remain in the villages.

The time-tables of the trade schools are adapted to local needs. As a rule, they comprise 6 hours' general training and 33½ hours' workshop practice and technical drawing. The farm schools have similar time-tables but workshop practice is replaced by practical work on the farm, in the gardens and nurseries, in the fields, in reafforestation and stock-breeding.

At present, the trade schools for rural artisans comprise the following sections: carpentry, rural building, native sculpture, basket-making, forging and rural mechanics, the manufacture of ready-made clothes, and shoemaking. As a rule, the course lasts 2 years. Pupils in the carpentry and building sections sometimes co-operate in the construction of small buildings outside the school. Pupils are required to be at least 12 years of age, the actual age-range being usually from 14 to 17.

The vocational training schools (*écoles professionnelles*), both trade and agricultural, are open to pupils who have completed their primary education (6 years), possess a good knowledge of French and are physically fit. In principle, pupils should be between 12 and 15 years of age, but in practice they are between 14 and 17.

The course lasts 4 years (3 years at the agricultural vocational training schools). Specialization is intensified in the last 2 years.

The vocational training schools train future skilled workers. The curricula of these Congolese schools are similar to the corresponding Belgian curricula. The level of studies is that of the lower stage of secondary education.

In addition to their practical training in the workshops, pupils receive a sound theoretical training, which enables them later on to increase their knowledge of their trade and to improve their professional qualifications.

There is little specialization at the vocational training schools, for the Congolese economy cannot yet offer highly specialized workers the same wide prospects of employment as exist in highly developed countries.

At present, these schools comprise the following sections. fitting, turning and machine tools, maintenance mechanics, motor mechanics, electric assembling, carpentry and cabinet-making, building, mining and public works, weaving, manufacture of ready-made clothes, sculpture, painting, ceramics, cutting and dressmaking (for girls). The pupils of the mining and public works section and those of the building section occasionally co-operate in work outside the school during the period of their studies.

The standard work plan comprises general courses, a mathematics course (in the first, second and third years), science and technical courses, technology and practical work. Teaching is in French. The vocational training schools are normally directed by engineers and technicians holding diplomas granted by the metropolitan higher technical schools.

Teachers in these schools must be specialists in the various subjects taught and possess recognized technical and teaching ability.

The agricultural vocational training schools (*écoles professionnelles agricoles*) provide a 3-year training course for the subordinate auxiliary staff of agricultural services. They are open to older pupils who pass the entrance examination (at the level of the sixth class of the selective upper primary school) even, for example, married pupils, recruited among the uncertificated *moniteurs* who have been appointed under contract by the *chefferies* (tribal administrations). These schools train agricultural instructors, market gardeners, foresters, fishery instructors, plantation workers, and subordinate staff for the veterinary service.

The first year of agricultural education is the same for all pupils; thereafter they choose between the various sections. There is a tendency to extend the course of the agricultural vocational training schools to 4 years in order to bring them into line with the trade vocational training schools.

For apprenticeship schools (*écoles d'apprentissage*) conditions of admission are the same as for the vocational training schools, but certain exceptions are allowed. Lessons are given by certificated specialists in vocational training who possess teaching ability and have had recognized practical experience. In order to be entitled to promotion, teachers must follow a summer course at a special teacher-training centre in Belgium.

The sole purpose of these schools, some of which are annexed as sections to vocational training schools, is to teach industrial and urban trades. Today the apprenticeship schools comprise the following sections: motor mechanics, carpentry, masonry, mechanical weaving, electric assembling, maintenance mechanics, printing, shoemaking, book-binding, forging, fitting, soldering and welding. The course usually lasts 2 years, rarely 3 years and, exceptionally, 4 years. The time-tables are the same as those of the trade schools (*écoles artisanales*).

The technical schools (*écoles techniques*) train technicians for the industrial trades, fine arts and agriculture.

They correspond to the upper stage of secondary education and are open to pupils who have completed the lower stage of the secondary school or a course at one of the trade vocational training schools; candidates must pass an entrance examination.

There are two technical schools in the Congo, one at Leopoldville and another at Jadotville, and the number of Congolese pupils is increasing every year. When the Congolese system of vocational and technical schools is completed by the creation of advanced technical schools, technical pupils will have access to higher education.

Lower technical sections were recently established (1958) in order to facilitate the transfer of pupils from Congolese-syllabus vocational training schools to metropolitan-syllabus secondary technical schools (pre-technical schools).

Each of these secondary technical schools has a preparatory section. One of them also has an electro-mechanical section and the other a technical and mechanical section. The curricula are the same as those of the secondary technical schools in Belgium. The teaching staff is composed of university teachers and certificated teachers of higher technical education and part-time specialists who give lectures.

There are two academies of fine arts; the course lasts 4 years, made up of 2 years of preparatory study and 2 or 3 years of specialization. The preparatory studies comprise general studies, as well as the study of drawing in all forms, including decoration. The specialized studies are divided into two sections: an easel-painting section (3 years of study) and a decoration and publicity section (2 years). One of the existing academies has a sculpture and modelling section (2 years).

There are also agricultural schools at the upper secondary level, namely, the agricultural assistants' schools (*écoles d'assistants agricoles*), which correspond to the Belgian schools for agricultural technicians. The course lasts 4 years. Candidates must have successfully completed the

lower 3-year secondary course and must pass an entrance examination. These schools were established mainly for the purpose of training subordinate agricultural staff (assistant agronomists) and, in the second place, agricultural assistants for private companies.

Commercial education is still provided only within the framework of general secondary education, namely in the economics sections of the humanities course and the administrative and commercial sections in schools which apply a Congolese curriculum.

The industrial schools at Elisabethville and Jadotville provide evening courses in accountancy, shorthand and typing; these courses consist of preparatory studies and 3 years of specialized study.

The evening courses for adults are under the various directorates-general. They are designed chiefly to meet the local needs of the large centres, and provide instruction in languages, accountancy, commercial organization, etc. There are no rigid or uniform curricula for these courses.

Girls' vocational training schools. Vocational training for girls has now passed the experimental stage. In addition to the two schools for cutting and dressmaking (4 years of study) already opened, other girls' vocational training schools will be established in all the important centres and the number of subjects taught there will be increased.

Besides the vocational training schools, there are girls' commercial and technical training sections attached to the humanities sections in general secondary schools; they are open to girls who have completed the third year of the lower secondary stage. At the end of the 4-year course, these sections issue diplomas, under the patronage of the Belgian Central Board for Commerce and Accountancy, for assistant accountants, accountants and private secretaries.

There are also sections known as family sections, which are attached to the *athénées* and *lycées* (3 years of study) or operate independently (4 years).

Throughout the Congo, there are numerous home economics schools at the primary, post-primary and secondary levels. Courses last from 2 to 4 years, and are adapted to the local environment (urban or rural). Their chief aim is to prepare girls for their future role of wives and mothers.

Teachers. The training of technical school teachers raises an important problem. Except in the trade schools, the present teaching staff is almost exclusively European, but the number of Congolese teachers will increase as the quality of the teaching in the various subjects improves. A few teacher training sections are already training future African teachers for vocational training schools. A teacher training course is organized in Belgium for the benefit of technical school teachers in service in the Congo and of certain specialists who are recruited in Belgium and who do not hold the teacher's qualifying certificate.

Teacher training schools

Ecole d'apprentissage pédagogique (student teachers' training school). In principle entrants are required to have completed the third year of the ordinary upper primary school, but, in fact, there is an increasing tendency to recruit pupils with a more advanced primary education, particularly as the age of admission to the primary school is being gradually lowered. These schools are designed to fill a gap until the regular teacher training schools can provide an adequate number of certificated instructors. Their main object is to train supplementary teachers for village schools; the pupils admitted to them must be sufficiently able, and old enough to take charge of a class on completion of their training. The course consists in a revision of the subjects learnt at the primary school and in an introduction to primary school teaching methods. The methodological course is essentially practical.

Ecole de moniteurs (school for the training of instructors). The object is to train lower primary school and ordinary upper primary school teachers. Accessorily, until the teacher training schools are able to provide enough fully qualified teachers, the *écoles de moniteurs* provide teachers for the classes of the selective upper primary schools. The curriculum is organized so as to ensure the training of teachers within the four years following the fourth year of the selective upper primary school, or the sixth primary school year, or the seventh preparatory class. During the whole of this 4-year period, students receive general training corresponding to the curriculum of the lower stage of the modern humanities course. Teacher training proper and teaching practice are distributed over the last two years of the course. At the end of the fourth year, students receive the certificate of the lower stage of the humanities course and the instructor's diploma.

Ecole secondaire normale (secondary teacher training school). This school trains teachers who are destined, in principle, for the selective upper primary school. It comprises two stages: a lower stage (3 years of study), which provides general training, and an upper stage (also 3 years), which completes the general training and provides teacher training proper. At the end of this 6-year course, students receive the secondary teacher training school diploma.

Ecoles normales primaires (primary teacher training schools). The teacher training sections in secondary schools will shortly be converted into primary teacher training schools, at a level equivalent to that of the corresponding Belgian schools. The course will last 7 years. There will be a preparatory section, corresponding to the lower stage of the modern humanities course. The upper stage will comprise 2 years' general training, the curriculum of which will be identical with that of the third and second classes of the humanities, and 2 further years devoted to courses of the first class of the humanities and to courses and practical work in teaching and psychology. At the end of their studies at the primary teacher training schools, student teachers will receive the primary teacher's diploma and the Humanities Certificate.

Ecole normale moyenne (secondary teacher training college). Shortly, the Congo will be provided with several secondary teacher training colleges. These will be either state or grant-aided private schools, established in the most important localities but covering the whole country, for

students will be recruited from all regions. To be admitted to these schools, candidates will have to be in possession of the Humanities Certificate or of the teachers' diploma; ortherwise they will have to pass an entrance examination. The course will last 2 years.

Professeurs agrégés de l'enseignement moyen du degré supérieur (higher secondary school teachers) must have completed 4 years' university studies, including 2 years' studies for the *candidature* and 2 years for the *licence* and *agrégation*. They teach the subjects which they studied at the university.

Other schools

Schools for handicapped persons. The school for deaf and dumb children and adolescents, founded at Beno (Kwango district) by Italian nuns, may be mentioned as an example of schools of this kind.

Social art workshops. Handicraft schools of this type exist in certain regions where the artistic tradition, although still strong, is in danger of declining. These small workshops, which are attended by local artisans, train pupils in the handicrafts. Most of them are directed by artists, free of charge, and are aided by the Government and local authorities (grants, co-operatives for the sale of hand-made products, etc.).

Special schools of a technical nature are organized directly by certain governmental services to meet their own needs. Mention may be made of the following: the postal school, the telecommunications school, the police school, various schools run by the Force Publique, the aerial navigation technical school of the Kamina metropolitan base, and the school for petty officers of the naval service. The last named trains a number of civilians to meet the needs of certain private or semi-governmental firms and the navigable waterways service; marine engineers and deck hands are also trained here (2 years of study). Reference may also be made to the school of meteorology, which trains skilled observers for meteorological and aviation purposes, the school of public works and the school for surveyors.

The Government medical service organizes schools for medical assistants (upper secondary level) and schools for male nurses, midwives, etc.

Accelerated vocational training courses have been established in order to meet the needs of certain centres. These courses provide from 7 to 9 months' training organized on French lines, for skilled workers (masons, carpenters, plumbers), and surveyors.

Out-of-class activities

Pupils take an active part in the internal organization and social life of the school. They are entrusted with various activities and assume certain responsibilities. Activities are both manual and intellectual, collective and individual, and cover the most varied fields; their chief object is to develop the pupil's sense of responsibility, from the educational, social and civic standpoints. The most diversified means are used for the purpose, particularly sports and games, as well as intra or inter-school competitions.

TRENDS AND PROBLEMS

The secondary education system in the Belgian Congo, as described above, has not yet received its final form. Among the Government's present aims are the following:

1. To speed up as far as possible the transition from schools organized on the old basis to schools organized on the new basis, i.e., providing instruction of a level comparable with that of metropolitan schools. This will entail changes in the curricula and in the structure of education.
2. To develop secondary education, so that all gifted pupils may continue their studies, thus meeting the country's needs.
3. To improve the recruitment and training of teachers, in order to improve the quality of teaching; to train an adequate number of teachers.
4. To construct and adapt school buildings and encourage the production of textbooks and teaching materials, in order more nearly to meet educational needs.
5. To adapt teaching to the character, mentality, needs and way of life of the African people.

STATISTICS

Population (mid-year 1958 estimate): 13,559,000.
Area: 905,381 square miles; 2,344,932 square kilometres.
Population density: 15 per square mile; 6 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, total enrolment of 1.7 million pupils (not including adult education or special education) represented approximately 13 per cent of the total population. Of these pupils, 4 per cent were receiving pre-primary education, 92 per cent were enrolled in primary schools, 1 per cent in middle and secondary schools, nearly 2 per cent in vocational schools, and 1 per cent in teacher training schools. There were altogether 317 students receiving university education. Between 1953 and 1957, primary enrolment had increased by 61 per cent. (See Table 2.)

Enrolment trends in secondary education, 1950–57. Between 1950 and 1957, each of the three types of secondary education showed rapid increase in enrolment. Thus, enrolment in middle and secondary schools more than doubled during this period, and more than tripled in teacher training schools. The average total enrolment at the secondary level of education for the period 1955–57 was about 3.6 per cent of the estimated population 15–19 years old. (See Table 1.)

Educational finance, 1959. For the year 1959, total recurring expenditure on education amounted to 2,469,300,000 Congolese francs. This represents an average expenditure of 176 francs per inhabitant. (Official exchange rate: 100 Congolese francs = 2 U.S. dollars.)

Note. Data referring to special schools are not included here.

1. Including adult education pupils in unaided private schools.
2. Excluding teachers of 66 pre-primary Protestant Mission schools.
3. Not including teaching staff of schools for the clergy (3,753 pupils).
4. Not including teachers for 3,002 pupils.
5. Some domestic science schools have not been included.

RUANDA-URUNDI

Trust Territory

The Territory of Ruanda-Urundi was placed under Belgian mandate by a decision of the League of Nations dated 31 August 1923, and was approved by the Law of 20 October 1924. The authority entrusted with the administration defined the status of the Territory in the Law of 21 August 1925 and the Royal Decree of 11 January 1926 providing for the latter's execution.

Following the resolution adopted by the General Assembly of the United Nations in London on 9 February 1946, and at the Assembly's invitation, Belgium deposited a draft trusteeship agreement which was accepted on 13 December 1946.

The organic law of 21 August 1925 states that Ruanda-Urundi is administratively united to the Belgian Congo. It raises the status of the Territory to that of a Vice-Government-General and stipulates that Ruanda-Urundi shall be deemed a separate legal and financial entity.

THE EDUCATIONAL SYSTEM

Education is organized on the same lines as in the Belgian Congo; certain problems, however, are peculiar to Ruanda-Urundi and are resolved in accordance with the special circumstances of the Territory.

At Astrida, an important institution of the official congreganist type, there has been set up, alongside the traditional sections, a school of administration which provides training for posts in the territorial civil service as well as for other public appointments. The courses given have reference to the laws, regulations and customs of Ruanda-Urundi. In the field of technical education, this institution has an agricultural assistants' school and a school for training veterinary assistants. A preparatory section trains candidates for these schools. It also has a pre-university section, which prepares students for higher education, that is to say, for the Faculty of Agriculture, which was opened in 1958. There is also, at a lower level, a school which provides training for subordinate posts, particularly the posts of clerk and accountant.

There are two vocational and technical training schools, one at Kigali and the other at Usumbura. The Kigali school has a preparatory section, a vocational training section (for carpentry) and an apprenticeship section (motor mechanics, masonry and dressmaking). The Usumbura school has a vocational training section (carpentry, cabinet-making and maintenance mechanics) and an apprenticeship section (motor mechanics, masonry and carpentry).

The two agricultural vocational training schools in Ruanda-Urundi are situated at Kigali and Karuzi.

The Ruanda-Urundi Institute of Arts, Commerce and Trades provides evening courses at Usumbura.

Lastly, 18 handicraft sections are distributed throughout the Territory: 9 carpentry sections, 1 indigenous art section (ceramics), 5 masonry sections and 3 ready-made clothing sections. All these schools are organized on exactly the same lines as the corresponding schools in the Belgian Congo, except for a few differences in detail due to their adaptation to local conditions.

TRENDS AND PROBLEMS

The qualitative improvement of secondary education and its development in general, the improvement of teacher training, the construction of new school buildings, the adaptation of textbooks and, lastly, the working out of curricula with special reference to African needs are matters to which the authorities are now devoting special attention.

STATISTICS

Population (mid-year 1958 estimate): 4,700,000.
Area: 20,916 square miles; 54,172 square kilometres.
Population density: 225 per square mile; 87 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58 there were 246,229 pupils enrolled in school, not including twice as many adults attending 'catechism schools' and literacy courses. The school enrolment represented about 5 per

cent of the total population. Ninety-six per cent of all pupils were enrolled in primary schools, where there was an average of 41 pupils per teacher. The proportion of girls in the total school enrolment was less than 30 per cent. Between 1953 and 1957, primary school enrolment increased by 19 per cent. (See Table 1.)

Enrolment trends in secondary education, 1945–57. All three types of secondary education showed rapid increase between 1945 and 1957, particularly vocational schools and teacher training. Nevertheless, the average total enrolment for 1955–57 represented barely 1 per cent of the estimated population 15–19 years old. (See Table 2.)

Educational finance, 1959. In the 1959 budget, recurring expenditure on education amounted to 287,400,000 Congolese francs. This represented an average expenditure of 63 francs per inhabitant. (Official exchange rate: 100 Congolese francs = 2 U.S. dollars.)

1. General and vocational secondary education only.

BHUTAN

In Bhutan there are a few widely-scattered schools in the rural areas of the country where the children receive their primary education. These primary schools are entirely maintained and controlled by the Government. Tuition, board and lodging, textbooks and stationery are provided free of charge by the Government to encourage the people to send their children to school. School uniforms are also given to the children every year. The medium of teaching is Bhutanese though Hindi and English are also taught.

On completion of primary education the children are generally sent to India by the Government for further studies. This system has been in operation for the last fifty years. At present there are about a hundred boys and girls studying in different schools and colleges in India. This includes also the students who have received Government of India scholarships.

The Government of Bhutan now feels keenly the necessity of establishing secondary and higher secondary schools throughout the country to promote better education and economize on the heavy expense incurred every year in sending the children outside. Great importance is therefore being given to this and it is hoped that very rapid progress will be achieved in this sphere.

Bhutan is making 'ten-year plans' for the rapid development of the country. It is expected that besides schools providing general education, some vocational institutions will also be installed by the end of the Second Ten-Year Plan.

[*Information provided by the Ministry of Education, Government of India, December 1959.*]

STATISTICS

Population (mid-year 1958 estimate): 650,000.
Area: 19,305 square miles; 50,000 square kilometres.

Population density: 34 per square mile; 13 per square kilometre.

THE EDUCATIONAL SYSTEM

Article 6 of the Constitution of 24 November 1945 states that every person has the right to receive and to give instruction under the supervision of the State. Other provisions include the following:

'Education is the highest function of the State. Public instruction shall be organized on the basis of the single school for all children. Attendance at school shall be compulsory from 7 to 14 years of age. State primary and secondary education is free.' (Article 157.)

'The State shall give financial assistance to promising pupils who, for lack of means, would be unable to attend courses of higher education, so that vocation and ability may be the accepted criteria rather than the individual's social or economic status.' (Article 158.)

'Private school shall be subject to the same state authorities, plans, syllabuses and regulations as public schools. They shall be free to give religious instruction.' (Article 159.)

'Schools maintained by welfare institutions shall receive assistance from the State.' (Article 160.)

'Education in primary, secondary, teacher training and specialized schools shall be controlled by the State, through the appropriate Ministry and in accordance with the Education Act. Teaching posts are permanent, under the conditions laid down by law.' (Article 161.)

'The public universities are autonomous and equal in status; their autonomy resides in their freedom to use their funds as they see fit, their power to appoint Rectors and teaching and administrative staff, to frame their statutes and courses of study.' (Article 162.)

'The public universities shall and must be subsidized by the Treasury out of national funds, independently of their regional, municipal and individual resources, whether present or future.' (Article 164.)

'Education at all levels is subject to state supervision exercised through the Ministry of Education.' (Article 165.)

'The State shall promote the culture of the people.' (Article 167.)

'The State shall promote the education of the rural population through rural school centres for Indians, which shall be comprehensive, providing instruction in economic, social and academic subjects.' (Article 170.)

Role of public authorities

Since April 1952, the Bolivian educational system has comprised two distinct sectors—urban and rural. The existence of the rural school system is due to the fact that there are 2,125,000 peasants in the country speaking Quechua and Aymara. There is at present an increasing tendency to unify these two sectors.

Urban education. This is directed by the Ministry of Education, acting through two central bodies: the Directorate-General of Education, a body with technical and administrative functions, which supervises educational institutions, and the Higher Office of Education, which has general administrative functions. A third body, set up in November 1959—the Higher Office of Culture, to which is attached the Directorate-General of Culture—is in charge of cultural extension activities and all specifically cultural matters.

The Directorate-General of Education is responsible for the planning and execution of the country's educational work. Under the chairmanship of the Ministry of Education, it comprises the Director-General of Education, and the Directors of pre-primary and primary education, secondary education, technical education (professional and vocational), literacy and adult education, pre-service and in-service training for teachers, physical education and sport, musical education, visual arts, and Catholic education (Article 199 of the Education Code). The Directorate of Technical Education for Women was added in February 1959.

For the control and administration of education, the Republic is divided up into educational districts and zones. Each district education office is staffed by a head (the district education officer) and the required number of district inspectors. They are under the authority of the Directorate-General of Education, which they represent in the area in which they operate.

Rural education. The Ministry of Rural Affairs is the supreme authority for the direction and promotion of the State's educational policy in this field. The Directorate-General of Rural Fundamental Education is responsible for the planning and execution of educational and social work in rural areas. Under the chairmanship of the Ministry of Rural Affairs, it comprises the Director-General of Rural Fundamental Education, the Supervisor of Literacy and Adult Education, the Technical Supervisors of Rural Welfare and of Rural Teacher Training Schools, the Supervisor of Planning and Curricula, the Inspector-General of Fundamental Education, the Assistant Supervisors of Hygiene and Health Education, of Rural Industries, and of Statistics and Personnel. (Article 205 of the Education Code.) The Directorate-General controls rural education throughout the country, through the District Fundamental Education Officers.

Role of private agencies

Private initiative in the educational field is entitled to state support, provided that it complies with existing legal requirements.

Employers, firms and proprietors having in their work area 25 or more children of school age are obliged to set up and support, at their own expense, primary courses or schools meeting a satisfactory teaching standard.

Under the provisions of the Constitution (Article 6), any individual or private body has the right to teach, and, consequently to found and direct educational establishments, under state supervision, without other restrictions than those prescribed by the laws in force.

The opening and operation of schools, their curricula, their internal organization, etc., must be approved by the Ministry of Education, following a detailed report by the Directorate-General of Education.

Private primary and secondary schools are subject to the state authorities, planning, curricula and regulations; they are, however, allowed freedom of religious instruction under the Constitution. At least 60 per cent of the teaching staff in such establishments must hold a state teacher's certificate; the remaining 40 per cent, even if they do not hold teachers' certificates, must have received some professional training, proof of which will be furnished to the competent authorities by means of an examination. The deputy head must be Bolivian. (Article 168.)

Exercising their rights under the foregoing provisions, independent bodies such as the Bolivian Mining Corporation and the Bolivian State Petroleum Deposits have organized primary and secondary schools in the areas where they are engaged in industrial production.

Some trade unions, for instance, the National Confederation of Railway Workers and allied trades, maintain schools for the children of their members.

For industrial and commercial education, financial resources are provided by a Law of 7 January 1948, which imposes a 2½ per cent contribution. These funds are administered by the Higher Council of Technical Education.

THE DEVELOPMENT OF SECONDARY EDUCATION

The Law of 12 October 1892 authorized the introduction of the 'concentric' method for secondary schools and the university, the purpose being to unify the teaching systems.

On 6 June 1909, the first National Co-educational Teacher Training College (Escuela Normal Mixta de Profesores y Preceptores de la República) was founded at Sucre, under the direction of the Belgian professor Georges Rouma.

On 24 May 1917, the Higher Teacher Training Institute (Instituto Normal Superior) for the training of secondary teachers was founded at La Paz.

In January 1929, the first general reform of secondary education was officially introduced. Credit for the initiation of this reform is mainly due to the Belgian professor Adhemar Gehain, then Director-General of Education.

In 1930, the 'University Revolution' occurred. The Statute of 25 July proclaimed the complete autonomy of education, taking educational policy out of the hands of the politicians.

Article 154 of the Constitution of 1938 modified this principle of complete autonomy; the university was left to manage its own affairs, but school education was placed under the responsibility of a National Council of Education enjoying administrative and technical independence.

In 1942, a movement for experimentation, study and organization in regard to technical education began with the founding, in La Paz, of the Pedro Domingo Murillo National Industrial School, industrial departments of the latter being also set up in certain secondary schools in other parts of the country.

The Constitutions of 1945 and 1948 did away with the autonomy of school education; Article 161 stipulated that 'the Ministry of Education shall resume exclusive control over primary, secondary teacher training and special education'.

On 20 January 1955, the new Bolivian Education Code was promulgated.

Legal basis

Chapters VI and VII of the Bolivian Education Code (1955) relate to secondary, vocational, technical and professional education.

Attendance at school is compulsory between the ages of 7 and 14. But the constitutional provision is not sufficiently clear, and as yet what the law requires has not been generally realized, namely, that Bolivian children must begin attending school at the age of 7 and must remain there throughout the next 6 years until they have completed their primary education. This situation has given rise to three serious consequences: (a) late enrolment of many children in primary school, creating age variations in all courses; (b) a high rate of absenteeism; (c) wastage.

Secondary education is not compulsory, but it is free of charge in the state *colegios* (for boys) and *liceos* (for girls). Encouragement has been given to private initiative in the matter of secondary education, but this has only attained full development in La Paz, Cochabamba, Santa Cruz and Oruro. Throughout the country, secondary education is for the most part in the hands of the State.

Administration

Administration is centralized in the Ministry of Education and the Directorate-General of Education, the structure and functions of which have been referred to above. At the present moment, ways are being studied of strengthening certain essentially technical functions performed by the Ministry of Education. They are to be incorporated in the Service for the Comprehensive Planning of Education, which is to come under the authority of the Directorate-General of Education. This step has already been taken in respect of the Educational Statistics Department which, following a Decree of 1 June 1955, has been placed under the Directorate-General.

In certain technical matters the Ministry is assisted by the Institute for Educational Research, a scientific establishment for the study, recording and solution of the educational problem in its bearing on development of a sounder knowledge of the Bolivian schoolchild, educational organization, educational resources, and the learning and teaching processes.

Control and inspection. The Directorate-General of Education conveys its technical and administrative instructions through the various district education offices. District or zone inspectors act as intermediaries between the district

education office and educational establishments. They are mainly concerned with classroom teaching and with improving teaching methods and ensuring that general and specific educational aims are achieved.

The inspectorate for secondary education covers secondary schools (*colegios* and *liceos*) and vocational, commercial and professional schools. A secondary school inspector may be appointed when a district has eight or more secondary schools, whether public or private; otherwise the schools are supervised directly by the district education officer. The inspectors give guidance in teaching matters to principals and class teachers and expound the programmes, methods and technical instructions received from higher authority. They supervise the work done in public and private schools and ensure that uniform standards are maintained.

Finance. The funds for maintaining and developing public education are controlled by the national budget. Expenditure incurred for educational purposes, whether in respect of buildings, properties, land furniture, equipment and school supplies, teachers' salaries, grants for teachers and pupils, or general operating expenses, is controlled by the Office of the Comptroller-General of the Republic, which has branches in every Department of the country. The principal purpose of the Office of the Comptroller-General is to ensure compliance with the national budget and to see that there is no allocation of funds not provided for in that budget.

School buildings are the responsibility of the State, but Decree No. 03624 of 4 February 1954 requires prefectures and municipalities to appropriate 10 per cent of their revenues for school buildings in their own districts. In addition, Decree No. 5333 of 27 October 1959 states that parents' associations, teachers' federations and civic bodies shall contribute materially to the building of their schools. For this purpose, the aforesaid bodies must conclude, with the National Committee or the Departmental Committees for School Buildings, contracts for the construction and repair of schools.

School welfare services. School medical and dental services have been set up. Suggestions based on the findings of social welfare workers are also tried out in experimental schools. A school meal service for children and young people in state primary and secondary schools has been in operation for several years.

TYPES OF SECONDARY EDUCATION

The highly centralized Bolivian school system does not allow for a great diversity in types of secondary education. However, the following may be noted: complete (6 year) and incomplete (3 and 4 year) secondary schools; secondary schools for girls (*liceos*) and boys (*colegios*); co-educational secondary schools; secondary schools with both vocational and purely academic sections; institutions providing the middle level of vocational and professional education.

The school year begins on 3 January and ends on 25 October; it comprises 200 teaching days.

General secondary schools

The aims of secondary education are as follows: (a) to preserve and develop the physical and mental health of young people; (b) to guide them in the intensive study of the basic subjects, and in the use of methods of self-education; (c) to perfect their cultural training and the full development of their personality; (d) to prepare them to play their part in economic life and engage in productive work; (e) to develop in them a sense of responsibility as individuals and as members of society; (f) to provide them, through a vocational guidance service, with a programme of studies adapted to their individual abilities and propensities; (g) to inculcate in them a respect for democratic principles and guide them in putting those principles into practice, thereby preparing them for the conscious exercise of citizenship.

No examination is required for entrance into boys' or girls' secondary schools, but candidates must have successfully completed the 6-year primary course. On completion of the 6-year secondary course, pupils receive a secondary-school leaving certificate, which entitles them to apply for a diploma of *Bachiller en Humanidades* at any of the universities in the country.

Secondary education is a continuation of primary education and is aimed at raising the adolescent's cultural level. Its subject matter and methods are so framed as to explore and guide the pupil's vocational, manual and intellectual capacities. The same curriculum is applied throughout the country.

The 6-year course is divided into a lower secondary cycle (4 years) and an upper secondary cycle (2 years).

The lower cycle provides instruction in the basic subjects as well as an initiation in studies for the *bachillerato* and, in *colegios* with industrial departments, in technical, commercial and other vocational studies. In these industrial departments, which will be dealt with more fully below, attention is also given to the general cultural subjects that are traditionally part of secondary education.

The upper cycle offers additional studies in preparation for the *bachillerato;* each subject is taught systematically and there is a tendency towards specialization. This cycle is divided into two sections—one for the natural sciences and the other for the social sciences; they have a common curriculum plus an optional compulsory syllabus providing intensive instruction in the subjects pertaining to the section chosen. Students may then go on to the university.

A model time-table, showing the number of periods per week, is given on the following page.

Teaching staff. Secondary school teachers are trained at the Escuela Nacional de Maestros at Sucre and at the Instituto Normal Superior in La Paz. The course lasts 4 years, following the completion of secondary schooling. Some universities (Sucre, for instance) train teachers of French and English. About half the teachers are teacher training college graduates; the rest are technical experts holding either established or temporary posts. Appointments are made by the Directorate-General. Teachers from teacher training colleges are listed in the register as soon as they take up their posts. Temporary teachers (i.e. those who are not established) may have themselves listed in

TIME-TABLE FOR GENERAL SECONDARY SCHOOLS

Subject	Lower cycle (year)			*Bachillerato*[1]		
				5th and 6th (each year)		
	1st and 2nd (each year)	3rd	4th	Natural sciences	Common	Social sciences

Total	38	39	39	35	—	34

1. Fifth and sixth years, divided into two sections, for the social sciences and the natural sciences respectively, with a common curriculum plus specialized subjects.
2. From the third year these are alternative subjects.

the register after 5 years of service, provided they fulfil certain requirements. Registered teachers must, after 10 years of service, take an examination to prove their aptitude before being permanently established in the teaching profession. If they fail to pass this examination, their established status is suspended for one year; if they fail a second time, they lose the guarantees accorded to them under the regulations.

Vocational and technical schools

Vocational, technical and professional education constitute one of the major concerns of the State, which is seeking to fit the adult population of the country to perform useful work, and to train skilled workers and technicians so that the economic development of Bolivia may be ensured.

Vocational education, as an integral part of general education and a logical complement thereto, is intended: (a) to foster an interest in and appreciation of productive manual work through manual training given in basic courses as part of the general educational system; (b) to offer pupils the assistance they need so as to discover and cultivate their natural aptitudes, ideals, ambitions and hopes; (c) to make each individual an asset to the community, producing more than he consumes and giving more than he receives; (d) to provide the human resources required by industry, agriculture, trade and all the technical activities relating to production.

According to the Education Code, industrial vocational education is intended: (a) to prepare suitable personnel for the operation and advancement of industry; (b) to provide additional instruction, through special courses, for apprentices and workers; (c) to make modern methods of work widely known; (d) to give guidance and information concerning the organizational and operational needs of industry; (e) to encourage in the community an appreciation of productive manual work; (f) to develop character; (g) to spread principles and promote practices calculated to improve the way of life of the working class; (h) to inculcate the principles of health and safety in industry.

A beginning is made with industrial vocational education in the last two years of some primary schools; it is then developed and intensified either in the first four years of certain *colegios* (those with industrial departments) or in the first four years of industrial schools. Thereafter it may be continued in the last three years of industrial schools and, finally, at a university.

Pre-vocational courses. These courses are given in the fifth and sixth years of primary schooling. After successfully completing them, pupils whose circumstances permit may, following selection by special bodies, go on to the first year of an industrial school or of some other specialized institution suited to their aptitudes.

The Department of Vocational Guidance set up by the Inter-American Co-operative Service for Education (Servicio Cooperativo Interamericano de Educación) which operates in the Pedro Domingo Murillo National Industrial School, takes a direct part in the selection of the pupils who are to go on from pre-vocational courses or from ordinary primary schools to *colegios* with industrial departments or to industrial schools. It also selects pupils who have completed the fourth secondary year to be admitted to the preparatory courses for the technician's grade (*grado de técnicos*); and those who, after completing the fourth year of the specialization grade (*grado de expertos*), wish to be admitted to the first year of the technician's grade.

Vocational courses in secondary schools. These courses are given in *colegios* with industrial departments, during the first four years. In these secondary schools, vocational education has, since 1947, been included in the lower cycle. The first two years are a period of vocational guidance, during which time the pupils attend various workshops so as to discover the manual as well as the academic subjects for which they are best fitted. Then, in the next two years, they have an opportunity of turning to account the experience gained in the vocational guidance period and choosing a particular field (e.g. mechanics, carpentry, electricity, etc.). In this period, useful knowledge can also be acquired by pupils who prefer to concentrate afterwards on a branch of technology or to pursue academic studies in the upper secondary cycle leading to the university. Pupils who leave school on completion of this period receive a Trade Certificate and will be able to earn their living as workers in industry. Pupils who wish to continue their technical studies can do so in the upper (industrial-technical) cycle of the industrial schools (*escuelas industriales*).

Industrial schools. (a) *Industrial-vocational cycle or specialization grade.* Selected pupils are admitted after completing

their pre-vocational primary sixth class or the ordinary primary sixth class. The first year constitutes an orientation period; a speciality is chosen in the second year, and the course finishes on completion of the fourth year. (b) *Industrial-technical cycle or industrial technician's grade.* The best pupils from the regular courses of the industrial-vocational cycle are selected for admission. These more advanced studies are pursued for a further 3-year period and prepare pupils for supervisory posts in industry. Selected students who have completed their fourth year of secondary schooling may also be admitted to the industrial-technical cycle, in the following ways: pupils who have completed the fourth secondary year in an industrial department may be enrolled subject to their taking a preparatory course of 1 year; while those who have completed the fourth year of the ordinary, academic secondary course may be enrolled subject to their taking a preparatory course of 2 years.

Pedro Domingo Murillo National Industrial School. This school is recognized as a model institute for industrial education in Bolivia. It provides the following regular day courses:

(a) a 5-year industrial-vocational cycle or specialization grade, on completion of which pupils receive the diploma of 'skilled tradesman' in one of the following options—workshop mechanics, motor mechanics, textile mechanics, sheet metal work, forging, welding, electricity, radio and sound, foundry work, joinery, cabinet-making, plumbing, building, mining, petroleum, tanning, saddlery, graphic arts, woodwork, analysis of minerals; (b) a 3-year industrial-technical cycle or technician's grade, on completion of which a certificate is awarded. After a further year of practical work in industry and the acceptance of a thesis, students are awarded the Industrial Technician's diploma in one of the following options—mechanical engineering, electricity, industrial chemistry, foundry work and metallurgy, woodwork, mineralogy, petroleum, building.

Candidates are selected by the Department of Vocational Guidance.

Special courses run by the Pedro Domingo Murillo School include evening classes for persons employed in industry who whish to improve their qualifications, and vacation courses for teachers of industrial-technical classes.

Schools of arts and crafts. There are a few schools of arts and crafts, most of which are run by the Salesian Order; they train tailors, shoemakers, typographers, etc.

Industrial schools for girls. These are state institutions for girls who have completed the ordinary primary courses. They provide a 6-year course in two cycles of 4 and 2 years. The first cycle, for specialized workers, is divided into an orientation stage and a vocational training stage, each of 2 years' duration. The curriculum for this cycle is divided into three main groups of subjects: dressmaking; decorative arts (hand and machine embroidery, lace-making, weaving); home economics. Child welfare and applied design are also taught.

The upper cycle trains women technicians for positions as heads of workshops.

There is a third division for the training of social welfare workers and health assistants; this instruction is given in institutions coming under the Ministry of Labour and Social Security and the Ministry of Public Health.

Commercial education. Apart from commercial streams in the lower cycle of secondary education, commercial education is provided by a 3-year course, based on 2 years of general secondary schooling, for secretaries, and a further 3- or 4-year course for book-keepers, etc.

Agricultural education. This is provided in 4- or 5-year courses following on from primary school.

Teaching staff. Teachers in industrial schools are classified as: (a) teachers of general educational subjects, such as Spanish, mathematics, history, geography, languages, social legislation, gymnastics, music and singing, etc., who are recruited from the teacher training colleges or are employed temporarily after several years' previous experience; (b) teachers of technical and industrial subjects, who are recruited from among graduates of foreign technical schools, or graduates of the Pedro Domingo Murillo School who have had further study abroad. A training college for technical teachers has now been set up.

Teacher training schools

Primary school teachers are trained in urban teacher training schools (at Sucre, La Paz and Santa Cruz) with a 4-year course beginning after the fourth year of secondary schooling, and in rural teacher training schools with a 4-year course beginning after the completion of primary schooling. There are vacation courses of 2 months which offer further professional training for temporary (uncertificated) teachers.

The Institute of Teacher Training (Instituto de Capacitación Docente) has just been set up under the Directorate-General of Education and under the immediate responsibility of the National Directorate for the Pre-Service and In-Service Training of Teachers (Dirección Nacional de Formación y Mejoramiento Docente). Its activities include: distribution of educational literature, with the object of providing all serving teachers with appropriate professional information; correspondence courses for temporary teachers; and supplementary vacation courses for the purpose of consolidating and appraising the results of the above-mentioned courses.

Other specialized schools

Education for blind, deaf and mentally deficient pupils is provided in the Institute for Special Education at Obrajes (a suburb of La Paz). This institute is under the authority of the Ministry of Labour and Social Security.

Education for children and adolescents in need of care and protection, many of whom present behaviour problems, is given in 'homes' (*escuelas hogares*) which have been set up in almost all parts of the country. The homes for adolescents, such as the Felix Méndez Arcos Institute for Special Education, are predominantly vocational. All these homes are under the authority of the Ministry of Labour

and Social Welfare, but the teachers giving ordinary instruction in them are appointed by the Directorate-General of Education.

Out-of-class activities

Holiday camps are now being instituted, and substantial financial provision is being made for them. An example is the new holiday camp at Yanacachi, in the district of La Paz, which is located in an area with a sub-tropical climate where there is an abundance of agricultural produce and fruit trees.

In the cities, plans are in progress for the laying out of playgrounds and sports grounds.

TRENDS AND PROBLEMS

A comprehensive planning service for all educational activities will be established in 1960. Preparatory work has been carried out by the Department of Educational Statistics, which is part of the Directorate-General of Education, and statistical offices have been set up in each educational district. A large allocation (10,000 million bolivianos) has been made for the school building programme; it will be administered by the Ministry of Education, various technical bodies, and teachers' associations. As was mentioned earlier, civic bodies were also set up by Decree No. 05333 to promote the school building programme.

The first National Congress on Education is to be held this year, under the auspices of the Directorate-General of Education and the teachers' associations.

STATISTICS

Population (mid-year 1959 estimate): 3,416,000.
Area: 424,163 square miles; 1,098,581 square kilometres.
Population density: 8 per square mile; 3 per square kilometre.

Summary of school statistics, 1954–56. Total enrolment at pre-primary, primary and secondary schools was over 340,000 pupils in 1956, representing approximately 10 per cent of the population. There were, in addition, some 12,000 pupils attending primary night schools. Of the school going population, 88 per cent were pupils in kindergartens and primary schools, some 9 per cent in general secondary schools and about 3 per cent in vocational institutions. Girls made up 45 per cent of enrolment at urban primary schools, data for rural schools are not available; 35 per cent of pupils at general secondary schools were girls and over half the enrolment at vocational institutions. The teaching staff numbered 9,710 at pre-primary, urban primary and general secondary schools in 1956 and the pupil teacher ratio was 23 in urban primary schools and 13 in general secondary schools. The proportion of women teachers is unknown. Between 1954 and 1956 enrolment increased by 9 per cent in urban primary schools, by 17 per cent in general secondary schools and by 76 per cent in vocational education (See table).

Educational finance, 1957. In 1957, the budget estimate for expenditure on education amounted to approximately 23,021 million bolivianos (official exchange rate: 1,000 bolivianos = 0.12 (approx.) U.S. dollar), representing about 7,034 bolivianos per inhabitant.

1. Data on teacher training and higher education institutions for 1950 were presented in Unesco, *World Survey of Education: II—Primary Education*, 1955, page 120. Comparable data for later years are not available.
2. Public schools only.
3. Probably including some adult education.
4. In 1956 there were 3,301 courses.
5. Urban primary schools only.
6. Including teacher training, conservatory and schools of music and fine arts.
7. Public schools only, not including schools of women's professions.
8. Including data on public and private teacher training. In 1956, in one private secondary teacher training institution there were 35 (F.21) students, and in 1954, in the higher teacher training institute of La Paz, there were 381 (F.226) students.

BRAZIL

THE EDUCATIONAL SYSTEM

Brazilian education is on the threshold of a period of complete reorganization of its structure, which in its present form is based on legislation mostly antedating the Federal Constitution of 1946. In the case of secondary education, each branch (except teacher training and industrial education) is governed by Federal Acts of Parliament designed to establish a uniform pattern of school organization throughout the country, to which same end the Federal Government exercises powers of direction and inspection over federal, municipal and private secondary schools (with the exception of teacher training institutions).

The 1946 Constitution steered a middle course between centralization and full state autonomy in education, a course which, apart from being more in keeping with the federal structure of the Union, is regarded as a necessity owing to the immense size of the country. The effect of this policy should be to limit the legislative powers of the Union Government to fixing the general norms ('the guiding principles and bases of national education') to which the entire educational system should conform. However, in addition to the organization and maintenance of educational systems in the Federal Territories, the Federal Government will also have the power to operate throughout the country a supplementary educational scheme strictly limited to making good local deficiencies. The States and the Federal District will organize their own systems of education, always subject to the general provisions of federal law, and private and municipal education in their respective territories will be under their supervision.

New legislation for implementing the provisions of the Constitution has been under consideration by Parliament since 1948. Pending the adoption of this new general Education Act, secondary education continues to be governed by the earlier Organic Laws on general secondary, commercial and agricultural education promulgated respectively in 1942, 1943 and 1946. For industrial education, a new Federal Act was passed in 1959 in which the trend towards centralization and uniformity is much less marked than in the previous Organic Law. Teacher training is, in practice, organized by the States which have full discretion, although most of them remain broadly faithful to the structure prescribed by the Federal Organic Law enacted in 1946 a few months before the promulgation of the Constitution.

Apart from these provisions concerning the division of powers between the various levels of public authority, the basic constitutional principles governing the Brazilian scholastic system as a whole are as follows:

1. All persons have a right to education which shall be given in the home and at school and shall be based on the principles of freedom and the ideals of the brotherhood of man.
2. Education in its various branches shall be provided by the public authorities; it may be provided by private initiative subject to the relevant provisions of the law.
3. Primary education shall be compulsory and shall be given in the national language only.
4. Public primary education shall be given free of charge to all; public post-primary education shall be free to all who furnish proof of lack or insufficiency of means.
5. Religious instruction shall be on the curriculum of all state schools; it shall be an optional subject taught in accordance with the religious faith of the pupil.
6. Each year the Union shall appropriate not less than 10 per cent, and States, the Federal District and municipalities not less than 20 per cent, of their revenue from taxation for the maintenance and improvement of education.
7. The Union Government shall contribute financially to the maintenance and improvement of the educational systems of States and of the Federal District.
8. The competent authorities shall be bound to include in their educational system welfare services to ensure that necessitous pupils are in a fit condition to profit from their schooling.

The structure of the educational system is shown in the diagram on page 269.

THE DEVELOPMENT OF SECONDARY EDUCATION

In the type of society which existed before the proclamation of the Republic (1889), when Brazil was a mainly agricultural and exporting economy based on slave-labour, the only young people who could aspire to secondary education were those belonging to the well-to-do classes, who took it as a stepping-stone to higher education. Despite the abolition of slavery (1888) and the beginnings of industrial development in the last years of the Empire, this state of affairs in secondary education persisted, with slight changes, at least until 1930.

During the opening years of the Republican era, the dominant feature in the evolution of general secondary education was the move to make it a genuine system of education instead of a somewhat heterogeneous collection of subjects studied simply with a view to passing university or similar entrance examinations and without real co-ordination. This improvement was mainly effected through federal legislation fixing common norms for the organization of secondary education throughout the Union. Observance of these norms was ensured by giving federal recognition to studies carried out in state and private schools for the purposes of entry to higher education.

The institution of Union Government supervision of non-federal schools, confined however to maintaining a single establishment in the federal capital, and the emergence of a conscious trend towards greater uniformity in Brazilian

secondary education were also the fruit of Federal Government action, which pressed steadily on through the Maximiliano reforms of 1915, the Rocha Vaz reforms of 1925, the Francisco Campos reforms of 1931 to the Gustavo Capanema Organic Law on Secondary Education of 1942.

Throughout this series of reforms, the dominant consideration continued to be to make secondary education a general cultural training—with a strong academic bias and an overloaded syllabus—which would provide the foundation for any type of specialized higher studies. Thus 'general culture' became the distinguishing mark of secondary education proper in the broader category of 'intermediate education' (*ensino médio*) which, in Brazil, is the generic term covering general vocational and education at secondary level.

The idea of introducing a certain degree of specialization into general secondary education was not taken up until the reform of 1931. The scheme adopted was to have a 5-year basic course followed by a choice of any of three 2-year 'continuation courses', in which the training given varied with the careers that pupils had in mind—law, philosophy and arts; medicine and natural science; or engineering and the mathematical and physical sciences. The reform of 1942 retained the division of secondary education into stages, namely, a first stage of 4 years (*ginásio*) and a second of 3 years (*colégio*), the humanistic or classical bias of the first stage being strengthened, while the distinction between the classical and science sides in the second had no pre-vocational implications.

While there were some earlier instances of foundations by local governments or private bodies, the existing Brazilian system of industrial education began in 1909 with the establishment by the Federal Government of a network of schools for basic vocational training, in the Federal District and later in the same year in the States of São Paulo and Rio Grande do Sul. The same period, more or less, also saw the start of federal *aprendizados agricolas* from which the network of secondary agricultural training establishments has evolved.

A point to note is that initially vocational education for industry and agriculture was almost exclusively at a primary or elementary level, general primary education being too undeveloped to provide an adequate foundation for vocational education at a more advanced level. Pupils completing the primary course went straight into active employment and learnt their trade on the job. The only ones left to go to the vocational schools were those who had received no primary education and had to be given it there concurrently with a little basic vocational training.

With the Organic Laws on Industrial Education (1942) and on Agricultural Education (1946), vocational training for industry and agriculture was finally raised in status to post-primary level. The effect of the two laws was to systematize these two types of vocational training on a nation-wide scale, public and private schools being merged in a uniform organization. Later, in 1959, a new Federal Act modified the position of industrial education, giving the federal schools, among other things, autonomy in administrative, financial, technical and didactic affairs. Agricultural education is still governed by the law of 1946.

Raising industrial education to secondary level brought with it the definition of its object as the training of medium-grade staff for industry—technicians, foremen and artificers. With the advance of industrialization came increased possibilities for training these cadres in industrial and technical schools. But this same development made it possible and necessary not only to employ lower-grade workers but also to train them for the less-skilled operations in industrial undertakings.

This need was met in Brazil by the establishment of the National Service of Industrial Apprenticeship (1942), which, in addition to setting up apprenticeship schools, also promotes training at work. Established by Federal Law, the Service (SENAI) is run by the industrial employers' association (Confederacão Nacional da Industria) and financed by contributions from member firms. Apart from their cash contributions, firms are under an obligation to employ junior workers (learners) attending apprentices' schools for part of their time, or to organize works training under the supervision of SENAI.

The final item for consideration in the history of vocational training is commercial education. This was always of post-primary or secondary level from its very inception at the beginning of the nineteenth century, when the Federal Government and the governments of various provinces began to concern themselves with the question, setting up special schools or including commercial studies in the curricula of the *colégios* and *liceus*. However, generally speaking, commercial education has led a very up-and-down and precarious existence.

With the coming of the Republic the Federal Government began to concern itself with regulating commercial education and to encourage private and local initiative by grants in aid. In 1926 a federal decree for the regulation of commercial education laid down the conditions for the recognition of schools of commerce, at the same time making them subject to supervision by a federal body. Reformed in 1931, commercial education was given its present structure in 1943 by the Organic Law on Commercial Education which is still in force.

Legal basis

The following are the main Federal Acts relating to education at secondary level:

Organic Law on Secondary Education, 1942, implemented by a number of ministerial orders of which the most important is No. 501 of 1952, consolidating earlier provisions.

Organic Law on Commercial Education, 1943, implemented by Decrees No. 14,373 of 1943 and No. 42,671 of 1957 and various ministerial orders.

Organic Law on Agricultural Education, 1946, implemented by Decree No. 21,667 of 1946, and Ministry of Agriculture orders.

Act No. 3552, 1959, implemented by Decree No. 47,038 of the same year; this is the new federal statute on industrial education replacing the former Organic Law of 1943.

Organic Law on Teacher Training, 1946, which continues to serve as a model for the teacher training legislation of many States.

Act No. 1076, 1950, authorizing the enrolment of pupils having completed the first cycle of a vocational school in the second cycle of general secondary studies.

Act No. 1821, 1953, implemented by Decree No. 34,330 of the same year, laying down a general scale of equivalence between the various branches of secondary level education.

Act No. 2432, 1954, implemented by Decree No. 37,494 of 1955, regulating financial assistance by the Union Government to all education at secondary level and establishing for the purpose the Fundo Nacional do Ensino Médio.

Administration

The administrative structure of the Brazilian education system runs through all three levels of public authority—the Union Government, the federated units and the municipalities—in as much as under the Constitution all three have the power to initiate action for the development of education.

As regards the two largest branches of education at secondary level—general secondary education and commercial education—the Union Government still exercises general directive and supervisory powers over state, municipal and private schools though its direct intervention in the way of running schools is extremely curtailed in general secondary education and practically nil in the commercial sphere.

The Directorates of Secondary and of Commercial Education in the Ministry of Education and Culture are the organs which accord federal government recognition to, and exercise supervision over, general secondary and commercial schools. Both comprise the following sections: Buildings and Equipment, Teaching and Administrative Staff, Guidance and Welfare, and Supervision and Inspection. In addition, each has a section running, respectively, the Campaign for the Improvement and Extension of Secondary Education (CADES) and the Campaign for the Extension of Commercial Education (CAEC), which promote courses for teachers and other activities designed to raise the standard of instruction.

In industrial education the Federal Government has the lion's share in the foundation and maintenance of schools. Since the Federal Act of 1959, which relates to federal schools only and gives them self-government in administrative, didactic, technical and financial matters, the Directorate of Industrial Education of the Ministry of Education has developed into an organ for the technical and pedagogical supervision of these schools and for auditing their accounts. It is however provided that the

GLOSSARY

colégio: secondary school offering a first-cycle general secondary course (*ginásio*) and at least one of the two second-cycle courses (science and classics).

escola agrícola: lower vocational secondary school of agriculture offering the two successive courses of the first cycle (introductory agricultural course and the course for the qualified agriculturalist's certificate).

escola agrotécnica: vocational secondary school of agriculture offering both the first-cycle courses (see *escola agrícola*) and at least one second-cycle course (technical agricultural courses).

escola de aprendizagem comercial—SENAC: part-time vocational training school of commerce, for juveniles and adults, organized by the National Service of Commercial Apprenticeship (SENAC).

escola de aprendizagem industrial—SENAI: part-time vocational training school of industrial training, for juveniles and adults, organized by the National Service of Industrial Apprenticeship (SENAI).

escola de belas artes: upper vocational training school in the fine arts, also offering courses combining general secondary and artistic studies.

escola comercial: vocational secondary school of commerce.

escola de enfermagem: vocational training school of nursing.

escola de iniciação agrícola: vocational secondary school of agriculture offering the lower introductory course in the first cycle.

escola industrial: vocational secondary school of industrial training offering the first-cycle (basic) course.

escola de música: vocational training school of music offering two secondary courses and one higher-level course. The secondary courses are for the training of professional musicians and music teachers respectively. To be admitted to the upper-level course candidates must have their general secondary leaving certificate and the music teachers' course certificate.

escola normal: teacher training school, carrying on from the first-cycle (*ginásio*) course.

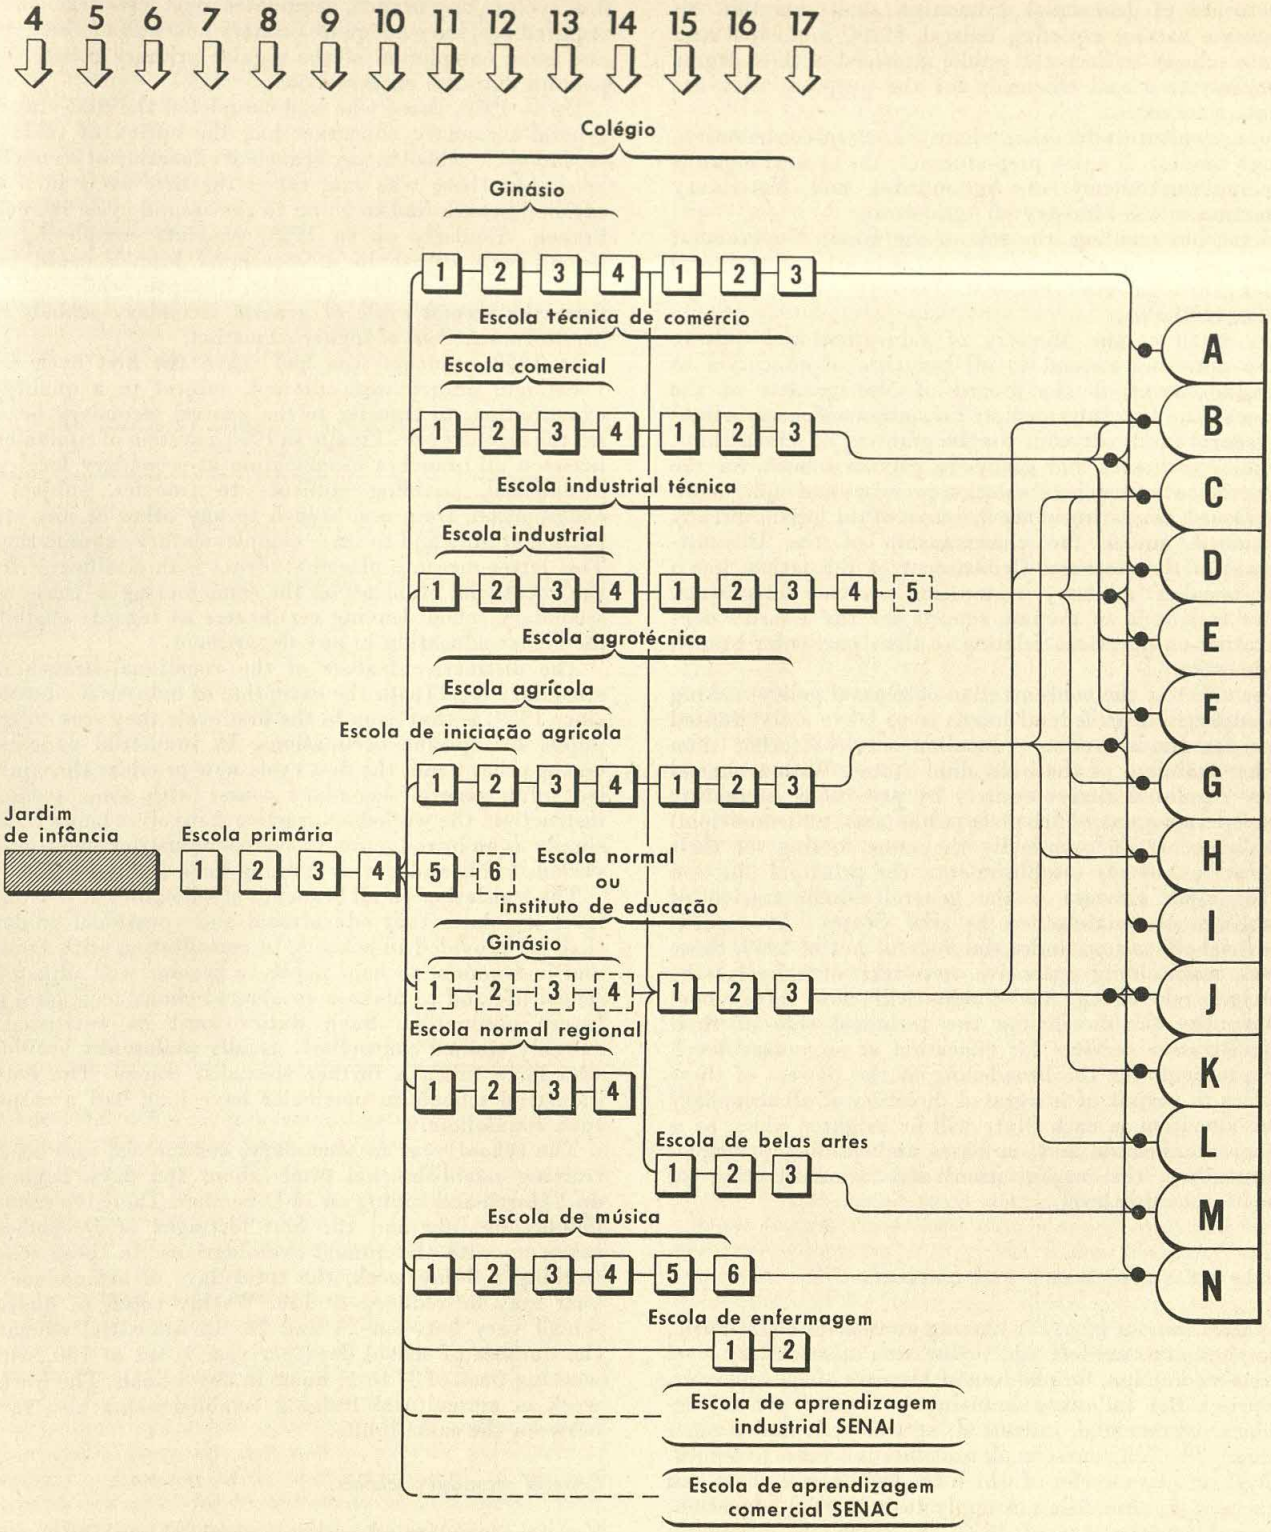
escola normal regional: teacher training school at first-cycle secondary level.

escola primária: primary school.

escola técnica: vocational secondary school of industrial training offering the first-cycle (basic) course and at least one second-cycle technical course.

escola técnica de comercio: vocational secondary school of commerce offering at least one second-cycle course (technical commercial course) with or without the first-cycle course.

ginásio: lower general secondary school offering the first-cycle course only.



instituto de educação: teacher training school offering a course at second-cycle secondary level, courses for primary school teachers wishing to specialize, and courses in school administration.

jardim de infância: kindergarten.

HIGHER EDUCATION

NOTE. The diagram does not show all courses. Students from vocational secondary schools who pass special qualifying examinations are able to take the entrance examination to an institution of higher education on the same terms as students who have completed a general secondary course. The requirement for admission to colleges of fine arts or music is completion of the general secondary course as well as the relevant vocational course at secondary level.

Directorate of Industrial Education shall maintain an evaluation service covering federal, state, municipal and private schools to keep the public informed of their degree of organization and efficiency for the purposes they are meant to serve.

For agricultural education, where the federal contribution, though modest, is again preponderant, the central organ is the Superintendency of Agricultural and Veterinary Education of the Ministry of Agriculture.

In teacher training, the role of the Union Government is confined to the provision of help, support and technical advice through the National Institute of Pedagogic Studies (INEP).

An organ of the Ministry of Education and Culture whose activities extend to all branches of education at secondary level, is the Board of Management of the National Fund for Intermediate Education which apportions the federal funds set aside for the granting of scholarships, subsidies to States and grants to private schools for the improvement of teachers' salaries, premises and equipment. This Board, consisting of the directors of the organs already mentioned, under the chairmanship of the Director-General of the National Department of Education, has a three-member 'advisory commission' in each directorate, whose task it is to prepare reports for the Board's consideration on questions relating to their particular branch of education.

The effect of the concentration of general policy-making and supervision in federal hands is to leave only limited scope for the secondary education services (other than teacher training) of the individual States. With technical policy regulated almost entirely by provisions emanating from federal organs, which place public (state and municipal) establishments on practically the same footing for their purposes as private establishments, the principal function of the state services is the general administration of establishments maintained by the States. As regards industrial education, under the Federal Act of 1959, those States maintaining extensive networks of schools—the principal one being São Paulo—will now have more opportunity for developing the technical side of their administrative services for education at secondary level. The prospects for the broadening of the powers of these services to permit of integrated direction of all secondary level education in each State will be brighter when, as is hoped, the Federal Act on bases and guiding principles decentralizes the organization and administration of education at this level.

TYPES OF SECONDARY EDUCATION

If special courses (e.g., for nursing auxiliaries or in music, or applied arts) are left aside, education at secondary level (*ensino mêdio*), i.e., for children of 11 years of age and over, comprises the following branches or types: general secondary, commercial, industrial, agricultural, and teacher training. The full course in all branches is 7 years in length, divided into two cycles of which the first lasts 4 years and the second 3; this does not apply to industrial education, governed by the Act of 1959, in which the minimum length of the second cycle is 4 years. For admission to the first cycle in any branch, candidates must have reached the required age, have adequate primary education (which does not mean completion of the regular primary course) and pass an entrance examination.

Up to 1950, those who had completed the first stage of general secondary education had the option of taking a second-cycle school in any branch of education at secondary level, but those who had taken the first cycle in a vocational branch had to go on to the second cycle in such a branch. Similarly up to 1953, students completing the second-cycle course in a vocational branch could only go on to higher studies in a related branch, while students from the second cycle of general secondary schools had access to any field of higher education.

In 1950, students who had taken the first cycle in a vocational branch were allowed, subject to a qualifying examination, to transfer to the general secondary branch for the second cycle. Finally in 1953 a system of equivalence between all branches of education at secondary level was established, enabling students to transfer, subject to examination, from one branch to any other at any stage in their studies and to take 'complementary examinations'. This latter measure placed students with certificates from the vocational branches on the same footing as those with secondary school leaving certificates as regards eligibility for higher education in any department.

The distinctive feature of the vocational branches at secondary level (with the exception of industrial education since 1959) is that even in the first cycle they seek to train pupils for specific occupations. In industrial education, on the other hand, the first cycle now provides the equivalent of a general secondary course with some technical instruction, the workshop practice it involves being treated simply as an introduction to typical industrial operations of various kinds and not as training for a definite trade.

The legislation on all branches of education at secondary level stipulates that educational and vocational guidance shall be provided in schools, in consultation with families and instructors, to help pupils to become well adjusted to school life and to make a considered choice of studies and future occupation. Such duties must be entrusted to suitably trained counsellors, usually philosophy graduates who have taken a further specialist course. The federal industrial schools in particular have long had a corps of such counsellors.

The school year in secondary, commercial and teacher training establishments totals about 165 days, beginning on 1 March and ending on 15 December. There is a month's holiday in July and the first fortnight of December is taken up with the annual examinations. In those schools working a 5-day week, the total days of attendance per year may be reduced to 140. Weekly totals of hours in school vary between 23 and 28. In industrial education the number of school days per year is set at 180, with a working week of 37 to 41 hours in day schools. The working week in agricultural training establishments also ranges between the same limits.

General secondary schools

General secondary education is provided in *ginâsios*, which offer a single first-cycle (*ginasial*) course, and in *colégios*

which offer the first-cycle course and one or both of the second-cycle courses described respectively as 'science' and 'classical'.

The relevant Organic Law defines the purposes of secondary education as follows: (a) the all-round development of the personality in adolescence, in continuation of the work of primary education; (b) as part of the ethical training of adolescents, to foster and strengthen their sense of patriotism and of human brotherhood; (c) to provide a general, intellectual training which can serve as the foundation for specialized studies at a higher level.

The curriculum laid down by the Organic Law on Secondary Education and the weekly allocations of time between subjects, to which all schools had to conform up to 1953, are shown in the following table.

TIME-TABLE IN GENERAL SECONDARY SCHOOLS

Since 1953, while the prescribed curriculum has remained the same, schools have been permitted some latitude in the use of class time, subject to the following minimum allocations: (a) 3 hours per week of Portuguese in junior and senior secondary courses and 3 hours of mathematics in the junior course; (b) in the classical course 14 hours per week for the study of languages in the first year, 10 in the second and 6 in the third, and 3 hours per week for philosophy in the second and third years; (c) in the science course, 6 hours per week of physics and chemistry in the first year; 9 hours of physics, chemistry and natural history in the second and third years.

The subject syllabuses issued by the Ministry of Education and Culture are designed to provide graduates of secondary education with the background of general education essential for higher study in any special field. These syllabuses are accompanied by instructions on how they are to be worked, the schedule having to be fitted in with the plans prepared by teachers. It is the common practice to follow the work schedule drawn up by the teachers of the Colégio Pedro II, a federal institution.

School work is evaluated on the basis of the pupil's monthly marks for class work, of the written examinations taken in June and November and of an oral test taken in December.

For admission to the junior secondary course, candidates must (a) be 11 years of age; (b) have reached a satisfactory standard of primary education (this does not necessarily mean completion of the regular primary course); and (c) pass a qualifying entrance examination. To be admitted to the second cycle pupils must have successfully completed the junior course.

Only teachers on the Register of the Ministry of Education and Culture are eligible for appointments in general secondary schools and, since the formation of the Faculties of Philosophy in 1939, new registrations are confined to graduates of those faculties. However, to cater for special local circumstances, non-graduates may be allowed to teach and, by passing an examination, can be registered as qualified to teach in those localities only where there are no graduate teachers to take their particular subjects.

In schools run by the public authorities established teachers are selected by competition on the basis both of their degrees and of an examination and accordingly are appointed for life, as provided in the Constitution. In addition to established teachers, there are other categories of instructors who come under the legislation applicable to civil servants in general. In private establishments, teachers have the protection of the labour laws and their salaries are based on the number of classes they give.

Teacher training in Faculties of Philosophy is given in four successive stages of 1 year, subdivided into the following specialized branches: mathematics, physics, chemistry, history, geography, social science, classical languages and literature, Romance languages, Anglo-Germanic languages and literature, philosophy and pedagogics. In their last year students are given a teaching course which includes the science and practice of education. The faculties have a demonstration college at which students can practise teaching.

Commercial education

Commercial education is given in *escolas comerciais* (first cycle only) and *escolas técnicas de comercio* (offering both cycles or the second cycle only). The junior commercial schools (*escolas comerciais*) offer a single course known as the basic commerce course; the senior commerce schools sometimes offer the basic course, and invariably provide one or more of the following technical courses: accounting, secretarial work, commerce and advertising, administration, and statistics, the first two being the commonest.

The Organic Law on Commercial Education defines the purposes of this branch of education as follows: (a) to train qualified personnel for specific activities in commerce and for junior administrative posts in public and private undertakings; (b) to give candidates for the simpler or routine jobs in commerce and administration a rudimentary vocational training; (c) to improve the qualifications of persons already employed.

All commercial education courses comprise both general educational and vocational studies. Since 1957 both groups in the basic commerce course have been sub-divided into compulsory and additional subject.

Additional subjects: (1) in general education: French and Spanish; (2) vocational: typing, shorthand, commercial drawing, domestic economy, sales practice, stores and distribution practice, entertaining.

Schools are responsible for organizing their own curricula, with due regard to the instructions of the Directorate of Commercial Education. From the second year onwards, all such curricula must include at least one additional subject, provided that not more than eight subjects are taken in any one school year.

In the second-cycle courses, the curriculum comprises a number of general educational subjects common to all these courses, and vocational subjects which vary according to the field of specialization. The example in the next column shows the curriculum for the course in accounting.

Industrial education

Under the Federal Act of 1959 industrial education establishments may provide the basic course by itself (amounting to a first-cycle general secondary education with some technical instruction) or the basic course and one or more technical courses (second cycle), in addition to apprentice-training courses (for students over 14—minimum duration of course: 20 months) and extra-curricular qualifying, refresher, specialization or 'new developments' courses (for junior or adult workers).

The purposes of industrial education are: (a) to provide a foundation of general education and the basic technical training to enable pupils to play their part as citizens and engage in productive work or to carry their studies further; (b) to prepare pupils for medium-grade specialist employment.

The object of the basic course is to broaden the general education background required in the primary course, and to test the aptitudes of the pupil and develop his potentialities, guiding him, with the family's co-operation, in the choice of employment or further studies.

The technical courses aim at training technicians for posts directly under engineers or managers, or for occupations whose technical implications make this standard of training necessary.

The curriculum of the federal schools for industrial education is compiled by the teachers' council of each school in conformity with general directives drawn up by the Directorate of Industrial Education and is subject to the latter's approval.

For admission to the basic course, candidates must have completed the full primary course or, if they have not received a full primary education but are at least 11 years of age, they must pass a general test of their knowledge. Technical courses are open to students who have completed the first cycle in any branch of education at secondary level.

Agricultural education

Agricultural education is given in junior, middle and senior vocational secondary schools of agriculture (*escolas de iniciação agrícola*, *escolas agrícolas* and *escolas agrotécnicas*). The first offer the introductory agricultural course and the second the course for the qualified agriculturalist's certificate; these are two successive stages in the first cycle. The senior agricultural secondary schools provide second-cycle training courses for agricultural technicians. Schools providing the senior courses may also provide the junior ones.

The establishments training technicians, like most agricultural schools, come directly under the Ministry of Agriculture. They are organized on the same lines as other types of education at secondary level, their purpose being to provide specialist training in the following branches: agriculture, animal husbandry, dairying, and agricultural mechanics. Agronomics and veterinary medicine are taught in higher schools of university standing.

Teacher training schools

Teacher training is regulated and organized by the individual States. However, the Federal Organic Law promulgated in 1946 sets the pattern from which few States depart to any appreciable extent. Thus, there are three categories of institution for the training of primary teachers: (a) the regional or rural teacher training course or school (respectively *curso normal regional*—the term used in the Federal Organic Law; *curso normal rural; escola normal regional;* and *escola normal rural*); all giving first-cycle training at secondary level; (b) the teacher training school (*escola normal*) giving second-cycle training at secondary level, following on from the first-cycle general secondary course (*curso ginasial*); (c) the institute of education (*instituto de educação*) which in addition to the second-cycle teacher training course provides specialist courses for teachers and school administrators.

The subjects studied in the first-cycle teacher training courses include Portuguese, mathematics, world and Brazilian geography, the natural sciences, elements of human anatomy and physiology, hygiene, world and Brazilian history, psychology and pedagogics, practice in teaching, drawing, manual training, music and physical training.

The second-cycle course includes the following subjects: Portuguese, mathematics, physics and chemistry, human anatomy and physiology, hygiene and health education, educational psychology and sociology, drawing and handicrafts, methodology, music and physical training.

STATISTICS

Population (mid-year 1958 estimate): 62,725,000.
Area: 3,287,204 square miles; 8,513,844 square kilometres.
Population density: 19 per square mile; 7 per square kilometre.

Summary of school statistics, 1953–57. In the school year 1957/58 some 6.7 million pupils were enrolled in educational institutions at all levels representing about 11 per cent of the total population. In addition 473,000 people attended

adult primary education courses. Of the total enrolment, about 86 per cent was in pre-primary and primary schools, 10 per cent in general secondary, 2 per cent in vocational, 1 per cent in all teacher training courses and 1 per cent at university colleges. In 1957 the proportion of girls enrolled in primary schools was 49 per cent, in general secondary schools 47 per cent, in secondary teacher training courses 91 per cent, in university colleges 23 per cent. The teaching staff at all levels of education numbered about 300,000 in 1957 of whom 74 per cent were women; in primary schools women teachers were 93 per cent of the total and in general secondary schools 43 per cent. The average pupil-teacher ratios in 1957/58 stood at about 29 in primary and 14 in general secondary schools. Compared with 1953/54, enrolment had increased by 30 per cent in primary, 34 per cent in general secondary, 33 per cent in vocational, 61 per cent in secondary teacher training courses and by 28 per cent in all higher educational institutions. (See Table 3.)

Secondary enrolment trends 1932–57. Enrolment in general secondary and vocational education has increased throughout this period; in secondary teacher training courses enrolment fluctuated between the years 1932–44 but since 1945 expansion has been uninterrupted. Average total enrolment in all secondary schools rose by 170 per cent between 1932–34 and 1955–57. The ratio of secondary enrolment to the age group 15–19 years old has thus steadily risen from 3 in the period 1932–34 to 13 over the three years 1955–57. A feature of the development of general secondary education has been the increase in the proportion of girls—from only 18 per cent of the enrolment in 1932 to 47 per cent in 1957. (See Table 4.)

Examination results in secondary education, 1953–57. Successful candidates for the lower stage secondary school certificate increased by 27 per cent between 1953/54 and 1957/58. The number of teaching certificates rose by 40 per cent over the same period. In all, some 144,500 certificates were awarded in general and technical secondary education in 1957/58 of which over half to women candidates. This represents an increase of over 21 per cent over the corresponding figures for 1953/54. (See Table 2.)

Educational finance, 1957. For 1957, the estimated expenditure on education by the Federal Government, provincial and municipal authorities was 19,502 million cruzeiros representing approximately 318 cruzeiros per inhabitant. Of this total, 38 per cent was spent by the Federal Government, 54 per cent by State Governments and the Federal District and the remaining 8 per cent by municipal authorities. (See Table 1.)

Note. The coverage of figures for the years 1955–57 differs slightly from those shown for previous years.

BULGARIA

THE EDUCATIONAL SYSTEM

Education in the People's Republic of Bulgaria is entirely democratic and available to all citizens without distinction of sex, nationality or race.

Article 79 of the 1947 Constitution of the People's Republic of Bulgaria stipulates:

'Every citizen has a right to education. Education is lay and democratic and progressive in spirit. Ethnic minorities have the right to instruction in their mother tongue; they also have the right to develop their own national culture, although the study of the Bulgarian language is compulsory.

'Primary education is compulsory and free.

'Schools belong to the State. The passage of a law is necessary when private schools are established; such schools are placed under State control.

'The right to education is assured by the schools, institutes and universities; by scholarships, boarding facilities and by financial and special assistance to particularly gifted pupils.'

It was these principles, enshrined in the Constitution, which provided the basis for the Law on Public Education drafted and passed by the National Assembly in 1948. This law was extensively amended and completed by the decree on public education of the Praesidium of the 1954 National Assembly.

The Council of Ministers is the supreme executive and administrative body in matters of public education. The Ministry of Education and Culture has overall responsibility for compliance with ideological and methodological policy and for organization and teaching arrangements for education and culture throughout the country. It produces the basic documents in connexion with schooling, namely school programmes and curricula, regulations and instructions for the different types and levels of educational institution; and it provides for the preparation and publication of textbooks and ancillary school books meeting all scientific, political and pedagogical requirements. It examines all questions with a bearing on the improvement of the organization, methods and forms of scholastic and instructional activity in schools, or to the directing and supervisory role of provincial and local authorities in the sphere of education and culture.

The administration of public education at provincial level is the responsibility of the Provincial People's Councils and their attached Education and Culture Sections; the latter are in direct control of teaching and administrative arrangements in every type and level of educational establishment in their respective areas. Their decisions are binding on scholastic establishments, but must not conflict with what the law lays down, with the orders issued by the Council of Ministers or with the instructions and directives of the Ministry of Education and Culture. The provincial Education and Culture Sections are answerable concurrently to the executive committees of the Provincial People's Councils and to the Ministry of Education and Culture, which supervises their activities.

Municipal and rural people's councils allocate the necessary funds to the schools, see that their premises are in good condition and help in school activities.

School principals, assisted by their teachers' councils, direct the school and classroom activities in their respective establishments of which they are the administrative heads as well as the directors of studies. They are responsible for the standards of classwork and training in their schools.

Attached to each school is a parents' committee, which is an auxiliary organ of the school for administrative and youth-training tasks. It functions independently of the school administration but in co-ordination with it.

The diagram on page 279 shows the structure of education in Bulgaria.

THE DEVELOPMENT OF SECONDARY EDUCATION

The invention of an original Bulgar-Slavonic alphabet in Bulgaria, the emergence of a vernacular literature and the opening of the first schools date back as far as the ninth century. A Slavonian culture, remarkable for the period, developed, but Bulgaria's subjection to Byzantine from 1018 to 1187, and later, for five centuries, to the Ottoman Empire (1396–1878), was to offer the severest impediment to the growth of learning and culture in the country.

It was only after the liberation of the Bulgarian people, in 1878, that a State-organized system of public education was inaugurated. Compulsory primary education was introduced by the Provincial Statutes on People's Schools, of 1878, the Tarnovo Constitution of the Principality of Bulgaria, of 1879, and the Organic Statutes of the autonomous province of Eastern Rumelia, of 1879, Two-grade and four-grade—and later, seven-grade—secondary schools were also opened to provide education beyond the primary level. Parallel with the Bulgarian schools there were schools maintained for the national minorities—Turkish, Greek, Jewish, Armenian—at their own charges.

Concurrently with the growth of schools of general education, training schools for industry, agriculture, and commerce were founded and organized.

The spread of education was encouraged by the 1885 Law on Public and Private Schools, which, like its predecessor, was based on the principle of municipal and communal autonomy as regards school organization. 1885 also saw the reunion of the Principality of Bulgaria and the autonomous province of Eastern Rumelia.

The Public Education Law of 1891 was the first law to cover all levels and types of education. It was, for many years, to ensure the precedence of general over vocational education in the schools, and in addition, concentrated the control of public education in the hands of the Government. Another of its provisions was for the opening of night

schools and schools on Sundays for pupils who had completed the primary cycle.

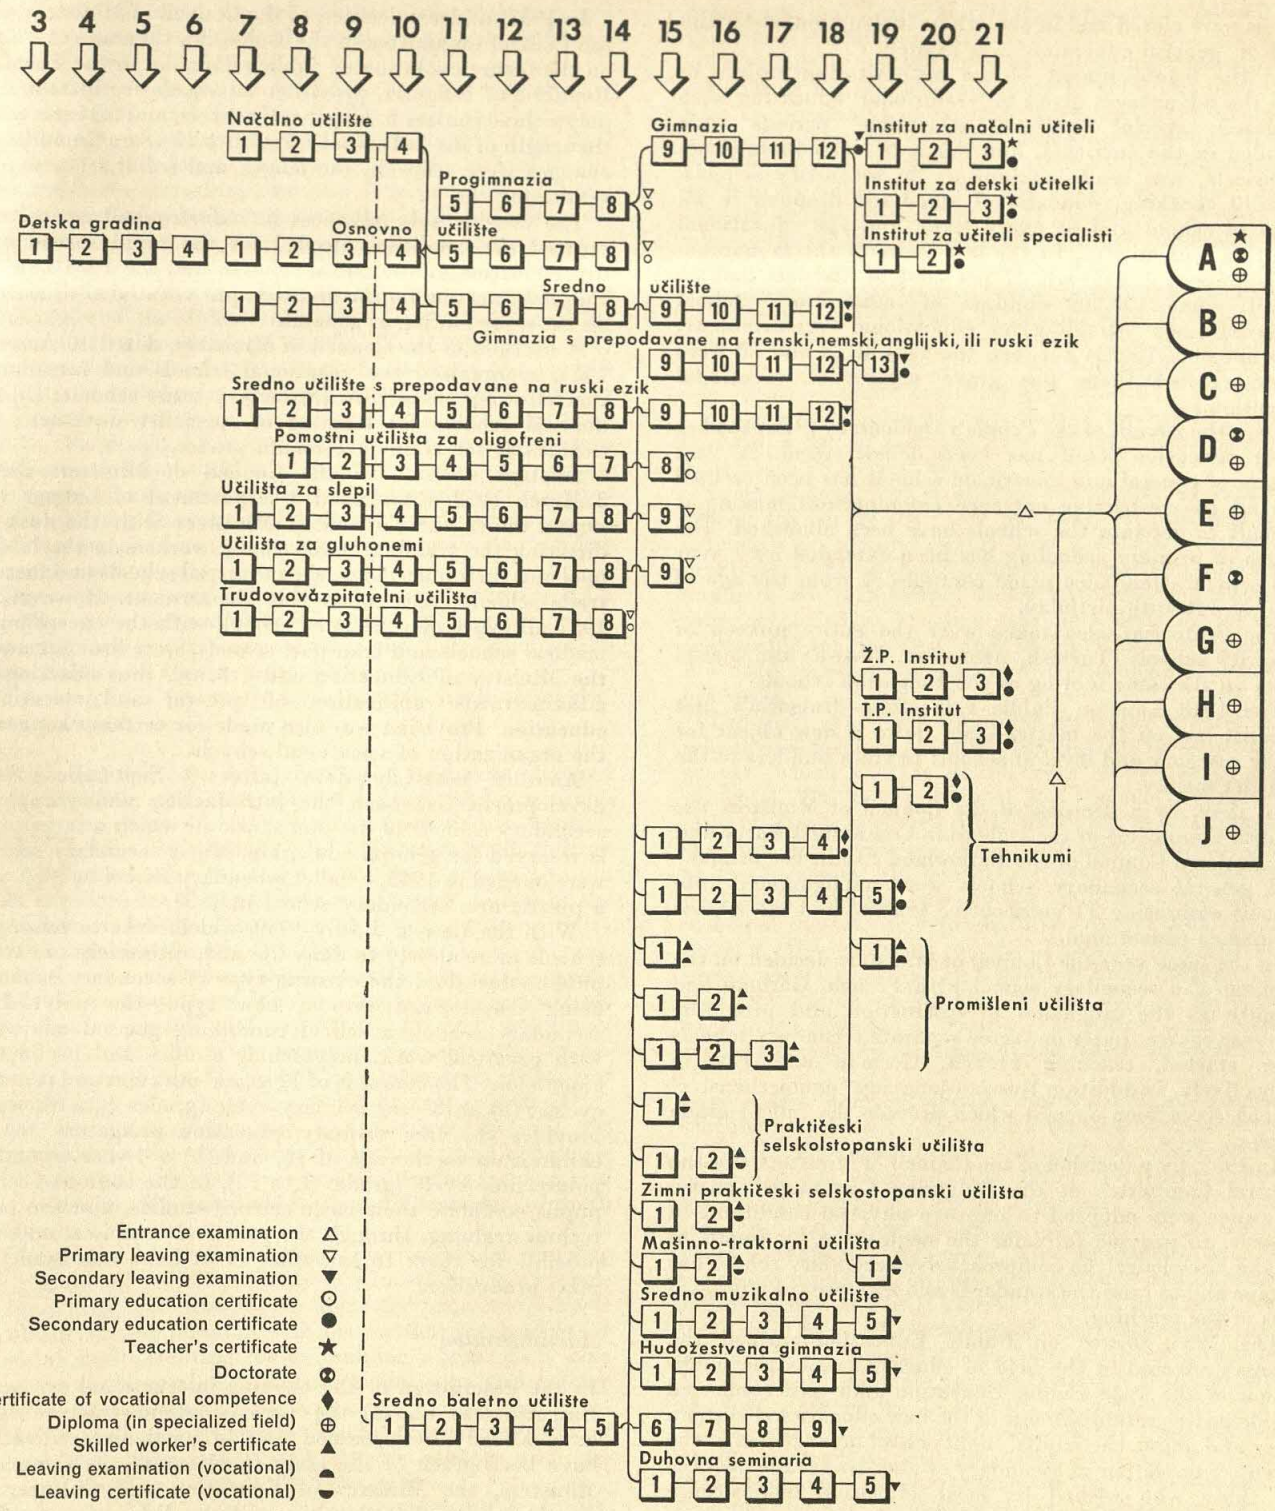
The secondary schools were based on four years of primary schooling and pupils who completed the full primary course (6 years) passed straight into the third grade in secondary school. The course was in two cycles, the first of 3 years' duration while the second cycle, split into 'classical' and 'science' sides, was 4 years' long for boys' schools and 3 for girls. In 1897 the length of the course was made 4 years for girls as well as boys and in 1904 the girls' schools were remodelled on the boys' school pattern. The secondary school leaving examination had become compulsory in 1891.

Under a law of 16 January 1896 a Government School of Painting had been opened and became the School of Arts and Crafts in 1898. However, the expansion of vocational education over the period was irregular, owing to the uneven development of the country's economy, though the 1897 Agricultural Education Law introduced elementary, secondary and higher schools of agriculture.

The Law on Vocational Education of 18 December 1906 laid down the broad lines for that type of education in Bulgaria. There were schools at elementary and secondary level, the latter started and maintained by the State, by Chambers of Commerce and Industry, and with moneys from legacies or supplied by private individuals or associations. These secondary schools accepted young people of either sex who had completed either the elementary vocational course, or the third year of secondary school or the upper cycle of the primary course.

The 1909 Public Education Law marked an important stage in the evolution of educational legislation in Bulgaria. Among other things, it incorporated with the Ministry of Education inspectorates, directly responsible to the Minister, for each of the special branches of education, and for the first time made provision for funds for the maintenance of the schools. The organization of the educational system was planned on lines making each level preparatory for the next and the general schools became the normal avenue to vocational establishments.

The 1921 Supplementary Law to amend the Law on Public Education was an attempt by the Agrarian People's Union Government (21 May 1920–9 June 1923) to align Bulgarian education in accordance with the economic needs of the country, to which end vocational education was given precedence over general. It was also a first attempt at unifying education. The period of compulsory education was increased from 4 to 7 years, embracing the 7 year old to 14 year old age groups, so that the whole of the primary course became compulsory, including the 3-year upper primary cycle, or *progymnase*, and certain vocational schools when the courses were completed in 2 years with from 3 to 10 months' study per year. Provision was also made for structural modifications in the teaching provided by the secondary schools, which enabled vocational secondary education to be founded on a broader basis of general education.



After the *coup d'état* of 9 June 1923 the number of secondary schools was considerably reduced; admissions were restricted with the institution of an entrance examination; and traditional education—the 'humanities'—expanded at the expense of science teaching and practical studies. The same trends appeared in the special laws on vocational education. A large proportion of the vocational

GLOSSARY

detska gradina (kindergarten): pre-primary school; there are kindergartens for handicapped as well as for normal children.
duhovna seminaria (seminary): vocational secondary school preparing for entry to priesthood.
gimnazia: general polytechnical secondary school with vocational training.
gimnazia s prepodavane na frenski, nemski, anglijski ili na ruski ezik: general secondary schools in which the medium of instruction is French, German, English or Russian.
hudozestvena gimnazia: vocational secondary school of art.
institut za detski učitelki: teacher training college for teachers in kindergartens.
institut za načalni učiteli: teacher training college for teachers in primary schools.
institut za učiteli spécialisti: teacher training college for teachers of practical subjects in general polytechnical secondary schools and vocational schools.
mašinno-traktorni učilišta: vocational training school for agricultural workers and technicians.
načalno učilište: lower primary school.
osnovno učilište: primary school.
pomoštni učilišta za oligofreni: school for mentally defective children (from age 8).
praktičeski selskostopanski učilišta: vocational training schools of agriculture.
progimnazia: upper primary school.
promišleni učilišta: vocational training schools for industrial occupations.
sredno baletno učilište: vocational secondary school of ballet.
sredno muzikalno učilište: vocational secondary school of music.
sredno učilište: general and polytechnical secondary school with vocational training, covering the complete course of general education.
sredno učilište s prepodavane na ruski ezik: secondary school, covering complete 12-years course of general education, with Russian as medium of instruction.
technikumi (technicums): technical secondary schools.
TP institut: vocational training school for postal and telecommunications officials.
trudovovazpitalelni učilišta: primary school for delinquent children.
učilišta za gluhonemi: primary school for deaf and dumb children.
učilišta za slepi: primary school for blind children.
Z.P. institut: vocational training school for railway officials.
zimni praktičeski selskostopanski učilišta: vocational training school for agriculture (winter courses).

schools were closed and in the others instruction under the head of 'general education' was limited.

On the establishment of the authoritarian régime in 1935 the advantages given to 'traditional' education were increased: special 'national education' periods were included in the curricula, and religious instruction, given by priests, was made compulsory in secondary schools. Broadly speaking, educational standards dropped in all types of school and at every level, and the educational situation was critical. In the last years of the monarcho-fascist régime (1943–44), 27 per cent of districts had no school; some 100,000 children of 'compulsory' school age, were not attending an educational establishment; over 500,000 citizens between the ages of 15 and 50 were illiterate; and there was grave neglect of vocational education.

Since the advent of the People's Democracy (9 September 1944) education itself has been democratized. A vast system of general and vocational schools has been created and all the restrictive entrance examinations making it difficult to get into the schools have been abolished. The length of primary schooling has been extended by 1 year and school attendance made compulsory from the age of 7 to the fifteenth birthday.

The State has also taken over the entire upkeep of minority schools (Turkish, Armenian, Jewish) and placed them on the same footing as the Bulgarian schools.

The 1948 Law on Public Education—Bulgaria's first socialist law on the matter—laid down a new object for every category and level of school: to train builders of the socialist society.

In 1949, by a decision of the Council of Ministers the Central Committee of the Bulgarian Communist Party and the National Council of the Fatherland Front, the primary and general secondary schools were amalgamated into schools embracing 11 consecutive grades, and all schools became co-educational.

In the same year the Council of Ministers decided on the opening of a secondary school with French, German and English as the languages of instruction and providing a 5-year course. Later on, three separate secondary schools were started, teaching French, German and English respectively. In addition Russian-language 'comprehensive' schools have been opened which provide the full 11-grade course.

In 1952, by a decision of the Council of Ministers and the Central Committee of the Bulgarian Communist Party, measures were adopted to improve physical conditions in schools, to provide fully for the acquisition by pupils of all the knowledge the comprehensive secondary school has to give and to raise the standards and increase the effectiveness of the teaching.

The 1954 Decree on Public Education ratified the changes effected in the field of education since the publication of the 1948 Public Education Law and confirmed the definitive establishment of the new educational system. Over and above the adults' night school arrangements, the private completion of secondary studies was made possible for those who wished it; local education bodies were encouraged to use their initiative; and powers were given for the expeditious settlement of questions relating to the development and improvement of education in the country.

In 1957, under a decision of the Council of Ministers and the Central Committee of the Bulgarian Communist Party on the future evolution of public education in the People's Republic of Bulgaria, provision was made for introducing polytechnic courses in all general schools, and for increasing the length of the full course from 11 to 12 years. In addition changes were made in the length and subdivision of the academic year.

The considerable advances in industry and agriculture created the conditions needed for the rapid spread and diversification of vocational schools, and the 1948 Law on Public Education for the first time put vocational education on the same footing as general.

A decision of the Council of Ministers, dated 10 August, 1951, reorganized the vocational schools and introduced the following categories: (a) factory trade schools; (b) industrial schools for training of specialist workmen; (c) *technicumi* for training foreman grades.

Another decision of the Council of Ministers dated 3 March 1952, established a Department of Labour Reserves under the Council of Ministers with the task of directing the training of the young workers in the labour pool and their placement; the industrial schools and factory trade schools came under this Department. However, in 1957 all types of vocational school, with the exception of medical schools and transport schools, were brought under the Ministry of Education and Culture, thus effecting an administrative unification of general and vocational education. Provision was also made for certain changes in the organization of vocational schools.

Another post-Liberation (after 9 September 1944) development has been the introduction and growth of secondary schools of art and music in which a large place is reserved for general education. Music secondary schools were opened in 1945, a ballet secondary school in 1950, and a plastic arts secondary school in 1951.

With the Law of 3 July 1959, which seeks to relate the schools more closely to daily life and, ultimately to extend public education, the existing type of secondary school is being transformed into a new type—the polytechnic secondary school, a school combining general education with practical work, polytechnic studies and production experience. The course is of 12 years' duration and is in two cycles: (a) an 8-year primary cycle (grades 1 to 8), which provides the free primary education obligatory for all children up to the age of 16, and (b) a 4-year secondary polytechnic cycle (grades 9 to 12), in the course of which pupils complete their basic science studies, and the polytechnic training, through the practical exercises, makes it possible for them to specialize in at least one branch of mass production.

Administration

In the description of the existing instructional system in Bulgaria (see above) the various administrative organs have already been named and in particular indications have been given of the main functions of the Council of Ministers, the Ministry of Education and Culture, the Provincial People's Councils and the Education Sections attached to them.

Curricula and syllabuses for all types of secondary

school are prepared by the Ministry of Education and Culture; those for the general schools must also be approved by the Council of Ministers.

The Higher Committee for Education is a consultative body to advise the Ministry of Education and Culture—on questions affecting school education, notably the most important draft laws, study schemes, the principles informing the curriculum and the fundamentals of Communist education. Its members are partly elected and partly *ex officio*.

Basic methodological questions are examined and settled by the Ministry with the help of the Institute of Pedagogics of the Bulgarian Academy of Sciences, and the in-service teacher-training institute. These institutes organize extension courses for teachers to improve the latter's intellectual standards and teaching skills, which may or may not involve them absenting themselves from their duties. Pedagogical bureaux have also been attached to the Education and Culture sections to study and circulate the best of what teachers have learnt in practice. The policy applied by the Ministry of Education and Culture, and all other organs of education, is directed to combating rigidity in teaching methods.

The textbooks used in all schools must be approved by the Ministry of Education and Culture. They are issued by a special State publishing enterprise and distributed by the State Books and Publications sales combine.

Teaching aids are made by a special State enterprise, Outchtechprom.

Control. General control of schools and studies is exercised by the Ministry of Education and Culture, and it oversees the way in which its rulings and directives are applied, either directly, or through the Education and Culture Sections attached to the Provincial People's Councils.

As the agencies of the Provincial Peoples' Councils, the Education and Culture Sections have entire responsibility for the organization of education and for the ideological, instructional and other school activities in all establishments within their areas. The provincial sections discharge their task of control and supervision through a corps of specialist inspectors who supervise the activities of secondary school teaching staff and principals. Measures prescribed by the inspectors are binding on principals.

The provincial Education and Culture Sections are responsible for the appointments, transfers and dismissals of all principals and teachers and are further in charge of the measures for improving the qualifications of both categories.

The provincial sections are also responsible for ensuring the regular allocation of funds to educational institutions in their area and drawing up plans for projected schools and hostels in conjunction with the sections responsible for planning and executing major building works. They also draw up the annual and long-term education and culture plans for their respective provinces.

The local People's Councils handle the procurement of general and educational supplies for schools and the necessary funds are put at their disposal.

Each school principal is personally responsible to the Ministry of Education and Culture and to the local People's Council for all that goes on in his institution. His rights and duties are laid down in the regulations for general and vocational schools respectively.

Principals of secondary schools—whether general, vocational or art schools—are selected from among persons who are graduates of an institution of higher education, who are authorized to teach, and who have had at least 5 years' practical experience. Principals of vocational and art schools must also have had some experience in production or the pursuit of art. Principals of general and vocational schools are appointed by the provincial Education and Culture Section under which they will serve, but principals of art schools are appointed by the Ministry of Education and Culture. In general schools, unless there are over 15 classes, the principal must do a certain number of hours teaching himself; in vocational schools and art schools he is exempt from this obligation.

In general schools with more than 18 classes the principal is assisted by an assistant principal and when there are more than 29 classes, by two.

In technicums with more than 350 pupils and vocational schools with more than 250, one assistant principal is put in charge of classroom work and a second in charge of practical work and production experience; where the numbers are respectively below 350 and 250 there is a principal in overall charge with one assistant principal responsible for practical work and production experience. Assistant principals are required to give 6 hours instruction per week.

The most important questions regarding the life of the school and teaching methods are put up to the teachers' council which acts as an advisory body to the school principal. The membership of the teachers' council is as follows: the school principal, who acts as chairman, the assistant principal, the entire teaching staff, the leader of the 'brigades' (in general schools), the instructors (in vocational schools), the doctor and the librarian. The principal may invite representatives of the local People's Council, the chairman of the Parents' Committee, representatives of social and political organizations, of the Dimitrov Union of Popular Youth and, in the case of vocational schools, of various enterprises and administrations, to attend meetings of the teachers' council.

Supervision and inspection. Supervision of secondary schools is ensured by the Education and Culture Sections under the Provincial People's Councils, to which specialist inspectors are attached. The latter are selected by the Executive Committees of the Provincial People's Councils from the best secondary school teachers with at least five years' practical experience. The inspectors deal with everything relating to the organization and quality of schooling and teaching activities in the province. Within their own fields of specialization, they also supervise the out-of-school activities of teachers, their basic task being to get results from every teacher in his own field comparable to those achieved by the best of his colleagues.

The provincial Education and Culture Sections, helped by the pedagogical bureaux, co-ordinate the work of the inspectors. The bureaux share with the inspectors the task of preparing and organizing lectures designed to raise the ideological, political, scientific and methodological standards of teaching staff, and their heads, with active assistance

from the inspectors, publish provincial bulletins on teaching questions, mainly with a view to making known the results of the most satisfactory teaching experiments. The bureaux also ensure close co-ordination of their own activities with the educational and cultural activities of the provincial trade union authorities and with work of the provincial committees of the Dimitrov Union of Popular Youth.

The Ministry of Education and Culture, through its 'methods' experts, affords scientific and methodological assistance to the inspectors attached to the provincial Education and Culture Sections.

Finance. Under Articles 79 and 80 of the Constitution of the People's Republic of Bulgaria, the State wholly maintains all educational establishments in the country. The People's Republic of Bulgaria has a consolidated budget which incorporates the national budget and the budgets of the Provincial Councils and State Social Insurance. The appropriations required for plant maintenance and equipment and building operations for establishments of nation-wide importance are included in the budget of the Ministry of Education and Culture, and for those of local importance only, in the special Education and Culture section of the budgets of the Provincial Councils.

Annually, before the end of the financial year, each educational establishment prepares estimates of its expenses for the following year: salaries, school supplies, library books, scholarships, meals, capital expenditures, supply of clothing and bedding, repairs, prizes, fêtes, decoration, etc.; heads of Education and Culture Sections check and approve the estimates of educational establishments in their charge.

The funds for the building of new establishments are provided under the budget of the provincial Education and Culture Sections and used in accordance with the building scheme prepared. Appropriations for school building also cover the costs of full equipment of the premises.

Staff salaries consist of base salary plus supplements. The base salary is intended as remuneration of teaching in school and covers the number of hours in class required of each teacher over the year. Teachers' weekly norms are fixed by administrative decision and are from 18 to 24 hours according to the category of school and the subject taught. When the time worked is above or below this norm, the base salary is increased or reduced correspondingly. Teachers with regular secondary school appointments receive increments averaging 10 per cent every five years. Teachers receive extra pay for work done over and above their normal duties—e.g., doing a colleague's work in addition to their own, during his temporary absence. Extra payments are also made to teachers taking charge of certain activities outside their classwork proper—running a library, or school society, acting as secretary of the teachers' council, running a methodological information room, laboratory, experimental unit, testing plot or study group, correcting compositions, etc., for each of which a single fixed fee is payable. For other activities, such as running a choir, orchestra, or physical culture class, payment is on the basis of a stipulated number of hours worked per week, which are added to the teachers' hours of classwork in calculating his base salary.

Although secondary education is not compulsory for the moment, it is open to all without any restriction. Dues paid by pupils in general schools are extremely low and not meant to cover the real cost of schooling, and are waived in the case of the permanently disabled, widows and orphans of the Patriotic War and the Resistance. For large families, fees are reduced by 50 per cent for the first child, 75 per cent for the second child, and waived entirely in respect of the third and subsequent children.

The State allocates considerable sums yearly for assistance to pupils taking secondary education. Pupils of all categories of secondary school whose parents are in temporary difficulties are given scholarships until completion of their studies.

Buildings and equipment. Schools are built on sites which have been previously approved by a special commission and must be of an area proportionate to the number of pupils, on the basis of a minimum of 12 square metres per head, exclusive of the school's base area. In very thickly populated districts the prescribed open space may be reduced by 35 per cent. Its allocation is as follows: 35 per cent for playing fields, 25 per cent for testing plots, 20 per cent for gardens and flower beds, from 5 to 10 per cent for livestock accommodation and out-buildings.

School buildings should not be over 3 storeys high, but 4 storeys are permissible in the capital. A minimum of 13 cubic metres of space per pupil must be provided.

In every secondary school provision is made for physics, chemistry and biology laboratories, drawing and music rooms, a medical and dental room, a library and reading room, a canteen, a kitchen, workshops for the various branches of industrial production, a gymnasium with cloakroom and showers, etc. Classrooms must not be larger than 8.6 metres long by 3.8 metres wide, and must be 3.4 metres in height to permit of tall windows. Each pupil in a classroom must have not less than 1.16 square metres floor space and 4 cubic metres of air. The ratio of the glazed areas of a classroom's outside windows to its floor space must be 1 : 4.

School welfare services. All schools are under the supervision of doctors and the State's medical services provide the necessary treatment. Anthropometric and psycho-physiological observations are made of each pupil.

Like all other citizens, teachers and pupils are entitled to free medical attention in case of illness or when prophylactic measures are called for.

TYPES OF SECONDARY EDUCATION

General secondary schools

The general secondary school, with 12 year course (grades 1–12), covers three cycles of education: elementary (4 years), intermediate or upper primary (4 years) which goes from the fifth to the eighth grade, at which grade compulsory education stops, and a senior or secondary stage (4 years, grades 9–12).

These three cycles may also be split up and given respectively in an elementary, an upper primary and a

secondary school, or the first two courses may be combined in an 8-year primary school.

Apart from these schools, general education is provided in the following establishments:

1. Upper primary night schools, night secondary schools incorporating the upper primary cycle, and night secondary schools proper: in schools of this category, 4 hours of study are done on 5 evenings a week, with 1 evening set aside for individual work and 'tutorials'. Students employed in factories or offices have their working day reduced to 7 hours without loss of pay or salary.
2. Twelve-grade sanatorium schools for tubercular and tuberculosis-prone children, or children who have been in contact with sufferers from the disease.
3. Twelve-year secondary schools (grades 1–12) with all teaching in Russian.
4. Secondary schools with French, German or English as the language of instruction (general secondary school course plus a year of preparatory study).

There are special study plans for these four types of school, but taken as a whole the subjects taught do not differ from those in the ordinary general secondary school.

General secondary education is open without restriction to those who have completed compulsory primary schooling.

Curriculum. The object of the general secondary schools is to give pupils a systematic and lasting knowledge of scientific principles and to develop habits and aptitudes in them which are consonant with the public interest. Under the new law, the general secondary schools now become polytechnics where the teaching is slanted towards production. Their main task is to train the young for life in the sense of equipping them to take their place in production and undertake work of use to the community, while concurrently fitting them to continue their studies in a centre of higher education.

Achievement testing. In every type of school, pupils' results are evaluated in terms of a scale of 6 markings and assessments: perfect (6), very good (5), good (4), fair (3), weak (2), bad (1).

At the end of the year, pupils who obtain at least a 'fair' for every subject are promoted to the next grade. Those marked 'weak' in more than two subjects are held back for a year. Pupils whose assessments include one 'weak' (or two at most) are held over to sit another examination at the beginning of the forthcoming school year. If they pass, they are promoted to the next grade; if they fail, they have to repeat the previous one. A grade can only be repeated once and no more than two grades may be repeated by a pupil during his school career.

Pupils who complete the last grade of the secondary school without having had any 'weak' assessments, take the secondary school leaving examination. It is taken in two parts—one in June and the other in September. The examination tests are the following: Bulgarian language (oral and written), mathematics (oral and written), Russian language (oral), physics (oral), chemistry (oral), Bulgarian history (oral). Pupils whose marks throughout secondary school give an arithmetical average rating the assessment 'very good' are exempted from sitting the secondary school leaving examination, with the exception of the written papers on Bulgarian language and mathematics which are compulsory for all candidates.

Candidates may attempt the complete secondary school leaving examination twice within 2 years after completion

TIME-TABLE FOR POLYTECHNICAL SECONDARY SCHOOLS
(in periods per week)

Remarks.

1. In grades 8–12 pupils do two weeks of 'polytechnical' practical work (grades 8 and 9) or 2 weeks of vocational training (grades 10,11 and 12).
2. In grades 5, 6 and 7, one of the 3 hours per week allocated to production work experience is reserved for work on the experimental plots.
3. For grades 1–11 inclusive, two weeks are reserved for excursions and work of public utility.
4. For modern language teaching (Russian and Western European) laboratory work (chemistry, physics, biology) and practical work (carpentry, metalwork, elements of machine operation, electricity, cars and tractors, rudiments of rural economy) classes of over 25 pupils are split into two groups. For physical training, classes of over 36 are also split; in co-educational classes, the girls form one group and the boys another.
5. In the first grade the periods are 35 minutes long; in all other grades, 45 minutes.

of secondary education. The school leaving certificate is granted to candidates marked not less than 'fair' in all subjects. Those marked 'weak' in three or more subjects must take the whole examination again, while those marked 'weak' in one subject (or two at most) may be deferred to the following session; they are entitled to two such deferments for any given subject.

Gold and silver medals are awarded to secondary school graduates who complete their studies with the assessment 'perfect' for both work and conduct.

Successful completion of secondary schooling entitles young people to continue their studies in any institution of higher education, in particular the State University and the technicums at post-secondary level.

Division of the school year. The school year is divided identically in all general secondary schools, running from 15 September to the end of June, after the examinations, with a winter holiday from 31 December to 11 January and a spring holiday from 1 to 7 April; the summer holidays are from the end of June to 15 September.

There are three school terms in the year: first term, 15 September–30 December; second term, 12 January–31 March; and third term, 8 April–10 June. Every pupil is tested in all subjects each term and parents are kept informed of the results.

On average there are 5 hours of classwork per day concentrated in one half of the day, and a 6-day school week. Periods are 45 minutes in length with breaks of 10 minutes each, increased to 20 minutes every third period.

Teaching staff. Secondary school teachers must have completed higher education. They are trained at the University, the Conservatorium of Music, the Academy of Fine Arts and the Higher Institute of Physical Culture. Extension courses for teachers are provided at special institutes.

Mathematics and language teachers do 18 hours classwork per week and other teachers 20 hours. In night schools the hours worked are reduced by 2 a week. Teachers have 60 days of paid holidays per annum.

Teaching staff and school principals are appointed and transferred by the provincial Education and Culture Sections in accordance with special regulations.

Teachers belong to a single trade union. They participate freely in the political and social life of the country and may be elected to the People's Councils and the National Assembly.

Women teachers retire at the age of 50 or after 20 years' teaching service; for men the retirement age is 55, and length of service 25 years.

Special schools (palliative-corrective schools)

There are special schools to provide primary education for blind, deaf and dumb or mentally retarded children. There are also special schools for the re-education through work of children with anti-social tendencies.

The entrance age for special schools is 7 years, except at the schools for mentally retarded children (auxiliary schools), where it is 8; this allows of more judicious selection among retarded children and the creation of conditions more favourable for their school activities and training, in the light of their ages and psychological peculiarities.

The length of the course is 8 years in schools for retarded children and schools of re-education through work, and 9 years in schools for blind or deaf and dumb children. In schools of the two latter categories, job-training has been introduced.

In the auxiliary schools and schools of re-education, the intermediate cycle covers grades 5–8; in schools for the blind it is grades 6–9. In schools for the deaf and dumb there is a combined cycle with no division into lower primary and intermediate cycles.

After completing the course in a special school and passing the leaving examination, pupils are awarded the primary leaving certificate, which entitles them to continue their studies in higher level general schools, industrial schools and technicums.

The opening and closing dates of the school year are the same in special schools as in general schools.

So far, the teachers for the special schools have been trained in a division of the Institute of Pedagogics provided expressly for the purpose. In future they will be trained at the university.

Vocational secondary schools (technicums)

Admissions to technicums are decided by the Commission for the State Plan according to the needs of the national economy. Those eligible are persons of either sex who have completed upper primary or secondary studies but are not employed in production, and the age for admission varies: it is up to 16 for those who have completed the upper primary course (*progymnasium*), up to 18 for those who have completed the ninth grade, and up to 30 for those who have completed the twelfth grade, subject in addition to the last-mentioned having done their military service. To give young people in productive employment an opportunity to complete their secondary technical training, obtain a more advanced qualification in the field in which they are employed and attain a higher level of scientific knowledge, theoretical and practical, without abandoning their work for production, night technicums and postal study departments attached to day and night technicums have been started. Entrance qualifications are the same as for the day technicums, but the upper age limit can be raised to 40. The courses take from 4 to 5 years for students who have completed primary education and from 1 to 3 years for those who have completed secondary education.

Curriculum. The purpose of the vocational secondary school (technicum) is to produce trained supervisory grades and skilled workers, with a secondary education behind them, for all branches of the planned economy, in particular for publicly owned factories etc.; to provide the young people who attend them with the essential theoretical grounding and to develop in them the practical skills and habits of industry that will fit them for their field of work and for leadership in it. Secondary vocational schools are also intended to prepare students for further study, in institutions of higher education, to shape them to a progressive, democratic pattern and to inculcate a socially

Remarks.

1. At the end of the fourth year, students take their final examinations in Bulgarian language and in mathematics.
2. The course leads up to a state examination in the following subjects: practice in the speciality taught; design; elements of machines; machine tools.

and politically scientific outlook on the world which will equip them to build a socialist society.

In ordinary day and night technicums both general education and specialist theoretical subjects are taken. Practical work is done only in the day technicums, where it is allotted roughly the same amount of programme time as general education and special theoretical subjects. In these day technicums, where the pupils have completed secondary education before admission, teaching is confined to the special theoretical subjects plus political economy or the principles of Marxism-Leninism, and practical work makes up the balance.

The accompanying schemes of studies for a mechanical engineering and an agricultural technicum respectively give some idea of the subjects taught and their general level. (It should, however, be borne in mind that these schemes of study are to be amended in accordance with the new law on education.)

A notable feature of these courses is the practical work, designed to relate theory to practice and to enable students to familiarize themselves with the various operations of production. For practical work classes are generally divided into two groups with a teacher in charge of each.

Teaching and assessment methods, and the conditions for promotion from one grade to the next are the same as in other secondary schools. Students in the technicums

for general secondary graduates take half-yearly examinations. In the other technicums, promotion to the next class is determined by the marks obtained during the year.

To relate theory more closely to practice and school work to daily life, and to establish more direct contact with industrial and agricultural production by accustoming technicum pupils to the actual conditions they will find there; farm, factory, etc. attachments are arranged for students at the end of each of the last 2 years, and take place on completion of the theoretical and practical syllabus. They are an integral part of the education process and amplify the teaching given, by 'exposing' students to the actual working conditions prevailing in industry or agriculture. Students work under the same conditions as ordinary workmen and are paid for their labour. At the end of the period they are given individual assessments of their work which are noted on their diplomas.

Achievement testing. In some technicums students sit for their pass in Bulgarian language and mathematics at the end of the last year but one, while the final year ends with a state examination comprising practical tests in the field of specialization chosen and tests on three or four special disciplines. In other categories of technicum, at the end of the final year students submit a thesis for their diplomas on a subject of their instructor's choice within their field of specialization, and their handling of it must show reasonable soundness of judgement.

Students who completed secondary vocational training level in a technicum are given the qualification of 'certificated technician (secondary)', which qualifies them for supervisory posts under senior supervision in their field of specialization in state farms, factories, etc., or other collective agricultural and industrial enterprises. Alternatively they can pursue their studies in a centre of higher education.

The school year. In secondary vocational schools the academic year begins on 15 September and ends on 28 June, so that pupils can rest during July and August and the first half of September while contributing to production in factory or field. In technicums which take pupils on completion of the upper primary course the year is divided

into three terms and into two in those where entry is after completion of secondary school; postal students also work a two-semester year. There are holidays in the winter from 29 December until 10 January and in the spring from 30 March until 5 April. The first term is from 15 September until 28 December; the second, from 12 January until 29 March; the third, from 6 April until 28 June.

The length of the school year is the same for two-semester as for three-term schools and the holidays are on the same dates. In two-semester schools the winter semester is from 15 September to 8 February and the summer semester from 9 February to 28 June with a break in each for the winter and spring holidays respectively. A 6-day week is worked, with 5 days actually in school; for second, third, fourth and fifth-year pupils one day being reserved for work in an industrial or agricultural undertaking. The classroom periods are the same length as in the general schools. The length of practical periods is 55 minutes, with a break after every two periods.

Teaching staff. The staff for teaching the special subjects are selected from: (a) persons who have completed higher education specializing in a given branch and have done the full course of the training institute for vocational school teaching staff; (b) graduates of the university-level special schools in the 'professional' category; (c) graduates of vocational secondary school (technicums), with two years' subsequent work experience and two years of study at the training institute for instructors responsible for practical work in the vocational schools.

Vocational training schools

These schools are day establishments training skilled workers. Students attend full-time and do not undertake production work. The Commission for the State Plan controls admissions according to skilled labour requirements in the various sectors of the economy. Candidates for admission to vocational training schools must have completed upper primary education, with the following exceptions: for the post office, engineering and mining schools the minimum requirement is completion of the ninth grade; and secondary education must have been completed for admission to the training schools for radio and cinema operators. Secondary school graduates are also eligible for the schools for machine operators and tractor drivers. In the vocational training schools accepting completion of upper primary education, the courses are from 1 to 3 years in length. Where the requirement is completion of the ninth grade or of secondary education the length of course is from 12 to 18 months.

Various categories of vocational training school have been started corresponding to the different sectors of the national economy.

Curriculum. The weekly hours of work in vocational training schools are more than in vocational secondary schools, rising to 42. The ratio between general education, specialist theory and specialist practical training in the course is approximately 1 : 1 : 2. The emphasis is placed on practical work and training for production to give students a solid practical qualification. The following scheme of studies gives some idea of the level of studies in these establishments.

Grand total	36	38	38

1. The third term of 10 weeks is devoted to work experience.

On leaving the vocational training school pupils are qualified as 'skilled workmen' in a specific field of specialization and are eligible for employment in state or other public enterprises. Graduates of vocational training schools have the right to continue their studies in a technicum, for the same field of specialization, subject to passing supplementary examinations in these disciplines included in the technicum curriculum for the appropriate grade but not taught at the vocational training school they attended.

To help young people to get their bearings in the choice of an occupation, information and introductory sessions and courses are arranged by schools and political and social organizations. To attract young people to the vocational training schools of the greatest social value, hostels are attached to them and study grants made to those attending.

Training courses. The purpose of training courses is to acquaint workers with the basic scientific and technological achievements in their particular field. The duration of the

courses is from 2 to 6 months and they are started, in the light of needs and conditions locally, for the training and retraining of workers and to improve their standard of training. Workmen are usually forced to discontinue production work to be able to attend the courses, but when the management of a factory or works wants to teach workmen a novelty in the technical field affecting the current production processes in the factory it arranges a 30 to 40-day training course which workmen may attend without discontinuing work.

Training courses are free, the appropriate finance for particular kinds of course being provided by the administration or enterprise starting them.

The schemes of study and curricula of the courses are approved by the Ministry of Education and Culture. They consist mainly of special theory and practical work in the ratio of approximately 1 : 2.

Secondary schools of music, art and ballet

Entrance to these schools is by competitive examination open to candidates from the whole country. Almost half of the pupils are holders of state scholarships.

Schools of music. Musical education is given at three levels: primary, secondary and higher. Primary musical education is bracketed with courses taken in general primary schools and ends at the same time as the general primary course. Entrance to primary music schools is by competition, the qualifying age being the same as that for the first year of the primary general school.

Secondary music schools, which offer a 5-year course, take two types of student: boys and girls not over 16 years of age who have completed their primary education and passed the competitive entrance examination; and young men and women in employment who are not over 30 years of age and have also passed the entrance examination. Curricula and syllabuses for each specialist branch are prepared by committees comprising professors from the secondary schools of music and the State Conservatoire and other eminent national musicians who also teach music, and are then approved by the Ministry of Education and Culture.

Pupils who have completed the full course of a secondary music school sit a final examination and receive a secondary school leaving certificate which entitles them to go on to the Conservatorium (for the diploma in music), or to a training institute for upper primary school teachers, or to the departments of philology, history and geography at the University of Sofia. Alternatively they are qualified for employment in theatre or symphony orchestras or operatic choruses, as choirmasters or directors of musical ensembles, teachers in children's music schools or clubs etc.

The Fine Arts Secondary School. This school takes boys and girls not over 16 years of age who have completed primary schooling and passed a competitive examination on a special syllabus. Candidates must have obtained the rating 'perfect' (6) for industry and conduct at primary school and an overall average grading not lower than 'good' (4).

The Fine Arts Secondary School gives training in painting, sculpture and draughtsmanship, and the length of the course is 5 years. The schemes of study and curricula for each branch drawn up by commissions comprising the teachers of the Fine Arts Secondary Schools and professors from the Higher Institute of Plastic Arts, and are then approved by the Ministry of Education and Culture.

Pupils who complete the Fine Arts Secondary School course and pass the final examination are awarded a secondary school diploma which entitles them to go on to the N. Pavlovitch Higher Institute of Plastic Arts, to the departments of philology, history and geography at the University of Sofia, or to teacher training schools etc.

The Ballet Secondary School. This school trains dancers and teachers of ballet and choreography.

The classical ballet department takes pupils who have completed the third grade at general school and are not over 10 years of age.

The Bulgarian folk dance department takes pupils who have completed the ninth grade at a general school and are not over 18 years.

The length of courses is 9 years in the classical ballet, and 2 years in the Bulgarian folk dance department, respectively.

On completing the course and passing a final examination, pupils are awarded a secondary school certificate which qualifies them for the corps de ballet in the country's theatres and opera houses or alternatively for further study in a university-level school of music, dramatic art, etc., in the departments of philology, geography and history of the University of Sofia, or as leaders of dance groups etc.

Teacher training schools

Teachers for pre-primary and primary schools are trained at teacher training schools providing a 5-year course consecutive to primary education. These schools are in the process of being abolished. In future, these categories of teachers will be trained at institutes providing a 3-year course consecutive to secondary schooling.

Out-of-class activities

Out-of-class activities are an integral part of the system of education. Youth organizations, study circles and all types of society formed in the schools permit pupils to amplify and deepen their knowledge and satisfy their taste for science, culture or sport combined with active participation in the domestic life and public activities of the school.

The Dimitrov Union of Popular Youth is an organization open to all Bulgarian youth, including pupils in the upper cycle of secondary schools. Associations of the Union operating in schools have groups in every class. Pupils from 10 to 14 years of age in primary or upper primary schools (grades 3 to 8) belong to the Dimitrov Pioneers Organization. The Union and the Pioneers Organization are the schools' leading helpers in their efforts to ensure that pupils acquire lasting knowledge and an intelligent acceptance of discipline.

Physical training and sport occupy a major place in school-centred out-of-class activities. Sports groups for gymnastics, athletics and volley ball are formed in schools,

as physical conditions and the availability of qualified coaches permit. In some branches of physical activity—e.g., gymnastics, athletics, skiing, volley ball and basket ball—there are organized competitions and nation-wide championships are held annually.

Among the most widespread forms of out-of-class activity undertaken by young people at school are study circles—literature, history, geography, foreign languages, biology, etc.—and hobby clubs—wireless, electricity, car, motor cycle, printing clubs, etc.

The varieties of amateur art activities undertaken by pupils are a major factor in developing their aesthetic sense. Exhibitions of artistic work are arranged each year in the schools, with evening recitals of singing and dancing and festivals of Bulgarian and foreign art.

A laudable tradition which has developed is the annual holding in the schools of a variety of competitions in literature and history for pupils, and in the technicums competitions on the special subjects studied there. These competitions provide an occasion for pupils to produce work of quality, based on their personal researches. For the best entries prizes are awarded by the Education and Culture Sections and the Ministry of Education and Culture. There are also competitions for pupils in mathematics and physics, which help to awake livelier interest in those subjects.

In recent years the work camp movement, in which students and secondary school pupils take an active part, has made great strides. Teams have worked on a wide range of tasks—construction of small dams and irrigation canals, terracing, preparing land for afforestation, school building projects, etc. In addition to the cash value of its work the work camp movement has proved to be particularly effective for inducing the taste for work and a better grasp of the realities of life.

Each school child spends 3 weeks in a summer camp in the mountains or by the sea under optimum conditions for well-being and health, three-quarters of the maintenance costs being borne by the State. There is a great deal of travel by children, with each school arranging excursions from one to several days in length which enable the children to get to know the country better.

TRENDS AND PROBLEMS

Despite the great successes achieved, education in the People's Republic of Bulgaria does not fully meet the heightened requirements of socialist construction. The basic defects of the education system in force until now—and particularly of the general secondary school—have been due to the fact that courses were too 'bookish', and unrelated to practice and national production.

The main defect of the general secondary school has lain in its orientation, in the lack of realism which has seen its essential task as preparing candidates for higher education and appointment to administrative posts, with no attempt to train for productive work. This shortcoming was less apparent and less serious when secondary education was reserved for the few and the number of pupils completing the secondary course coincided with the number entering higher educational institutions. But it can no longer be tolerated now that the secondary school has been democratized and the normal outlet for its graduates is into employment in production.

It is in terms of these shortcomings of the educational system that its reorganization has been undertaken. The reconstruction now in progress aims at combining schooling with broadly based polytechnical training and vocational experience so that the schools will turn out well balanced citizens able to play their part in national production and cultural life. This reform also seeks to give youth trained bodies and sound moral and aesthetic values, to implant love of country and devotion to the cause of peace and co-operation between the peoples.

STATISTICS

Total population (mid-year 1958 estimate): 7,728,000.
Area: 43,048 square miles; 111,493 square kilometres.
Population density: 180 per square mile; 69 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58 pupil enrolment (not including adults in evening courses) reached a total of about 1,520,000, being nearly 20 per cent of the total population. Of these pupils, 18 per cent were in kindergartens, 64 per cent in primary schools, 10 per cent in general secondary education, 5 per cent in vocational education, less than 1 per cent in teacher training and about 3 per cent in university or other forms of higher education. Total enrolment increased by 12 per cent between 1953 and 1957. There were increases of 7 per cent in the kindergartens, 12 per cent in primary education, 35 per cent in general secondary education, and 66 per cent in higher education. On the other hand, enrolment

decreased by 10 per cent in vocational education, by 32 per cent in teacher training at the secondary level and by 59 per cent at the higher level.

Teachers numbered 66,290 in 1957, an increase of 16 per cent over 1953. The average number of pupils per teacher in 1957 was 24 in primary schools, 20 in general secondary schools and 16 in vocational schools and courses. (See Table 2.)

Enrolment trends in secondary education, 1939–57. Total enrolment (including adults) in general secondary education was one and a half times as high in 1952 as in 1939, even though there had been a steady decline since 1945. In the technicums there was a more or less steady rise in enrolment between 1939 and 1952. While in 1939 the technicums enrolled barely one-tenth of all secondary school pupils, the proportion grew to 30 per cent in the period 1950–52. The decrease in enrolment of general secondary education was thus offset in part by the growth of the technicums. Comparing the 1945–49 period with the year 1939, total enrolment in secondary education (including general, vocational and teacher training) showed over 100 per cent increase, thereby raising the secondary enrolment ratio from 17 to 29. Further growth in general secondary education, partly offset by decreases in vocational education and teacher training, brought the average enrolment for the period 1955–57 to 200,000 pupils, being about 35 per cent of the estimated population 15–19 years old. (See Table 3.)

Examination results in secondary education, 1953–57. The number of secondary leaving diplomas granted each year during this period was as follows: 1953/54, 30,224; 1954/55, 28,719; 1955/56, 32,991; 1956/57, 33,900; 1957/58, 32,266.

Educational finance, 1958. State budget estimates for 1958 provided 1,527 million leva for education, an average of 197 leva per inhabitant. This recurring expenditure was distributed by purpose as follows: central administration, 0.7 per cent; teachers' salaries, etc., 54 per cent; other instructional expenses, 38 per cent; other recurring expenditure, 8 per cent. (See Table 1.) The distribution by level and type of education is shown in Table 1 B.

2. Enrolment in technicums only.

BURMA

Secondary education in Burma lasts 5 years, and is based on 4 years of primary schooling. Schools catering for the first 3 years of secondary education are called middle schools and those catering for all 5 years are called high schools. The age range of children in the junior secondary level is generally 11 to 14 years and of the children in the senior level 14 to 16. To raise the rather low standards in all stages of secondary education, arrangements are being made to have an additional year for secondary education and to raise the standards of the Matriculation examination. This plan will take effect by 1960–61.

THE EDUCATIONAL SYSTEM

Education is provided by both state and private agencies. The provision of secondary education was free in all state schools until April 1959, since when fees have been charged. Private schools levy fees from pupils for their own maintenance, as no aid whatsoever is given to them by the State. The part played by private enterprise in the field of secondary education is nevertheless very pronounced, and along with the state system, private secondary education is steadily expanding both as regards the number of institutions and the number of pupils enrolled.

In the administration of education, power of direction and control are vested in the Director of Public Instruction, who carries out the policies laid down by the Ministry of Education. Funds are provided by the Central Government out of revenue.

A clause in the Constitution of the Union of Burma provides that 'no minority, religious, racial or linguistic, shall be discriminated against in regard to admission into state educational institutions, nor shall any religious instruction be compulsorily imposed on it'. Secondary education is thus available to all those who desire it

although, in the case of private schools, children professing a particular religion tend to go to a school established or sponsored by a mission of that religion. Despite the facilities provided by state and private schools only a small minority can take advantage of secondary education, largely for economic reasons.

As a sovereign independent State it is natural that Burma should strive for the adoption of her national language as the medium of instruction. In state schools all subjects are taught in Burmese, with English as a compulsory second language. In private schools, English or the mother tongue of the pupils can be used as the medium of instruction, but these schools must take into account the fact that in the public examination at the end of the first stage of secondary education all pupils are required to answer every paper in Burmese. In the Matriculation examination, papers could be answered either in Burmese or English till this year; as from 1961, answers will have to be in Burmese.

The main problem in secondary education at the moment is to break the bondage of traditional academic education and to develop facilities for technological and agricultural education. Discontent and frustration among pupils arising from a system of secondary education which over-emphasized academic studies has been all too common in the past, and diversified courses of instruction must now be provided to suit different abilities, interests, aptitudes and needs. The provision of courses which are more in accordance with their aptitudes and abilities should enable the pupils to attain higher standards of achievement. So in the field of secondary education, or for that matter at all other levels of education, the task is not only to expand but also to improve. The Second Four Year Plan, 1956–60, has been directed towards the achievement of this objective. Its aims are:

1. To secure an adequate number of fully qualified teachers.
2. To improve the school curriculum on modern lines for the benefit of the children and in line with the national economy of the State.
3. To secure good school textbooks and to distribute them effectively to all state schools.
4. To provide all-out aid for the improvement of discipline among pupils and teachers.
5. To provide sufficient accommodation, school furniture and teaching apparatus for increased numbers of school-children.
6. To open new schools on a more equitable basis.
7. To provide diversified curricula which will divert some pupils from the single-track curriculum leading to the University towards technical, agricultural and vocational courses.

THE DEVELOPMENT OF SECONDARY EDUCATION

Modern secondary education in Burma dates back to the beginning of British rule. The piecemeal conquest of Burma by the British in the nineteenth century led to the gradual decline of the indigenous educational system and the growth of a new system based on the needs of the times as seen by those charged with the administration of the country.

The most urgent need was to have a body of trained subordinates to assist in the new administrative machinery and the new commercial concerns. These assistants needed to have a good knowledge of English and to be familiar with Western ways of thought and methods of work. That paved the way for a new type of secondary education parallel to the old vernacular one.

With this object in view, Sir Arthur Phayre, the first Chief Commissioner of British Burma, formulated a definite educational policy for the Province in 1864. He proposed that the Government should set up central Anglo-vernacular schools in the main towns, and these government schools together with the private schools aided by the Government were to form 'a complete system of sound medium class education'.

As schools grew in number and size it was found necessary to form a government department of education, and this was established in 1866. Its task was to provide a state system of Anglo-vernacular education, grant scholarships to proficient pupils, give grants-in-aid to missionary and other private schools, regulate the publication and distribution of books and direct the course of education throughout the province.

The schools that came into existence were of three types, vernacular schools, Anglo-vernacular schools and English schools, a classification based on the difference in the medium of instruction: the medium of instruction in the vernacular schools was wholly Burmese; in the Anglo-vernacular schools it was Burmese in the primary stage and English in the secondary stage; and in English schools, English was used in both primary and secondary classes.

Vernacular middle and high schools. With the growth of Anglo-vernacular schools, instruction in traditional vernacular schools was also placed on a better footing by the adoption of a curriculum more or less similar to that obtaining in Anglo-vernacular schools except that English was omitted and the medium of instruction was Burmese. This led to a widespread demand for vernacular secondary schools, but the Vernacular Education Committee of 1924 found that the provision of such schools had outstripped demand. It suggested that the numbers of these schools should be limited by confining the establishment of middle schools to townships and high schools to headquarters of a district.

Attendance at vernacular schools in the secondary stage of instruction was small. This was due to the fact that the education given led nowhere. After completing courses in the middle and high schools, pupils found it difficult to obtain employment in the administration or the business world since their studies had not included English, and at the same time they found it difficult to return to the agricultural environment to which most of them belonged. The main fault lay in the curriculum, which offered no sort of technical or vocational courses.

The Government tried to meet the situation by making limited provision for the teaching of English in vernacular schools and by encouraging the production of more textbooks in Burmese for the higher standards of these schools. These measures improved the condition of the vernacular middle and high schools, but beyond helping to make the courses of instruction in the three types of schools more uniform, they did not contribute to a permanent solution.

What was actually needed was a change in the whole bias of instruction, and curriculum providing a basis for subsequent agricultural and vocational education.

As early as the beginning of the twentieth century, Lord Curzon had pointed out that one of the chief defects in the system of instruction was that it was not designed for a farmers' country. The few special schools listed by the Technical and Vocational Education Committee, 1927, offered agricultural education but it could hardly be considered sufficient for a country where the majority of the people depend on agriculture for their livelihood. Not only was agricultural training inadequate but so was that for other rural occupations, notably the cottage industries to which the villagers turned in the intervals between the seasons of work in the fields. The Technical and Vocational Education Committee, 1927, inquired into the extent of provision for training in such trades and found a pottery laboratory and a weaving institute, a lacquer-work school and classes for carpentry and blacksmith work. Almost 10 years after this inquiry, the situation had not improved to any considerable extent according to the Report of the Vernacular and Vocational Education Reorganization Committee, 1936.

Anglo-vernacular and English middle and high schools. The efforts made by the Government to provide and aid Anglo-vernacular and English schools were more successful. These schools gained popularity largely because they served the purpose for which they had been set up, although in the long run they failed to meet the changing social and economic demands.

Through the years, trade increased and administrative services began to expand. As new departments were developed, more assistants were required and more of these schools had to be opened. In the last Annual Report on Public Instruction before the 1939 war, it was stated that there were 32 English secondary schools with an enrolment of 12,194 pupils, and 238 Anglo-vernacular secondary schools with a total attendance of 51,048 pupils.

The very popularity of these schools and their increase in number ultimately turned out to be a disrupting factor in education. The schools went on producing more pupils with the same type of education, who looked forward to entering the University and sought the same kind of employment when they had finished their studies. But administrative posts and the upper civil service could not go on expanding for ever. The supply of 'English educated' students began to exceed the demand and soon brought about the problem of the 'educated unemployed'.

The problem was, of course, not confined to education but affected the whole economic and social environment of the people. It was necessary for people to realize that academic studies did not offer an education complete in itself, and that administrative work was not the only occupation which sustains and develops a country. More schools were needed to provide an education other than a literary one and enough jobs were needed for people so trained. But it was difficult to break the vicious circle: the University favoured the arts courses because of the conditions of employment outside and, because of this, the secondary school curriculum was also mainly literary. The Technical and Vocational Education Committee, 1927, in reviewing the situation, recommended that practical and scientific studies should have an important part in the curriculum, side by side with language, literature and other literary subjects.

At the time there were only a department of engineering in the University, turning out 10 students a year, and the Technical Institute, Insein, giving courses in civil and mechanical engineering and practical apprenticeship courses in carpentry, blacksmithing, fitting and machining. Similarly, there were few special classes and schools for vocational education. These included the normal schools and training classes for teachers, a police training school, signalling classes of the Burma Railways, classes for sanitary inspectors, a forest rangers' school, two veterinary schools, the De La Salle Institute, a survey school and a few orphanages and reformatories.

As the situation in regard to technical and vocational education remained unsatisfactory, the Vernacular and Vocational Education Reorganization Committee was set up in 1936; and by the year 1940 certain improvements had been effected. The number of pupils attending the Government Technical Institute had shown an increase over the numbers given in the report of 1927, and in 1939 evening classes were added. The State Polytechnic was also opened in Rangoon that year. This offered instruction in tailoring and outfitting, dressmaking and needlework, carpentry, bamboo and canework, laundry work and dyeing. Instruction was also provided in advanced accountancy and commerce, English shorthand, Burmese shorthand and English typewriting. The report also recorded 15 government-recognized commercial schools with a total attendence of 683 pupils and the State School of Fine Arts, Rangoon, which opened in 1939. This school offered instruction in painting, drawing, commercial design and Burmese music.

Practical courses were also introduced in the Anglo-vernacular and English schools. The *Quinquennial Report of 1932–37* noted that during the period under review, the curricula for English and Anglo-vernacular schools were broadened by the introduction of courses in general science, mechanics, commerce and business organization and domestic science. Also during the year 1937–38, 1 government English school, 4 aided English schools, 15 government Anglo-vernacular schools and 12 aided Anglo-vernacular schools provided courses in science.

Unfortunately, just as signs of improvement began to show in technical and vocational education, the country was overtaken by the second world war and the whole educational system was disrupted.

Administration

The distinction between the vernacular schools on the one hand and the Anglo-vernacular and English schools on the other became more pronounced when the vernacular system came under a separate authority and was administered under a code distinct from the two other systems. Initially, the Provincial Education Department, established in 1866, was in sole and absolute control of vernacular education. In 1917, control passed into the hands of the nominated divisional school boards. The boards undertook the administration and supervision of vernacular education

within their areas, subject to the general control of the Education Department and in accordance with the orders of the Government and the provisions of the Vernacular Education Code. But in matters such as training of vernacular teachers and public examinations and curricula, the Director of Public Instruction was the controlling authority.

On the establishment of the divisional school boards, the Government, in Resolution No. 14E-53 of 1 November 1916, stated its financial policy in regard to vernacular and Anglo-vernacular education. This so-called '1916 principle' required the whole cost of vernacular education to be borne by local funds. The divisional school boards were not long in existence, for in 1921, by the Burma Self-Government Act, they were replaced by elected local education authorities.

The new local education authorities comprised the district boards and the joint school boards and were composed of members chosen from among the elected district councillors who might under certain conditions co-opt other persons to be members. These new bodies inherited the control as well as the financial liabilities of vernacular education. Their duties and powers included the establishment, management, visiting and maintenance of all board schools within their jurisdiction. In addition they were responsible for the construction and repair of all buildings connected with these schools, and the appointment and pay of the teaching staffs. They were also responsible for the recognition, control, visiting and support of schools under private management. Such control as the Education Department still retained was exercised through the inspectors, who reported on the organization, management and efficiency of the schools. Their role however, was purely advisory, and if the local education authorities could justify their decisions they were not obliged to accept the inspector's advice. The whole system was meant to encourage local interest in education and to promote democratic control in other local affairs. Excessive decentralization, however, was found to be unsatisfactory, accounting for many of the defects and inefficiencies in the vernacular education system.

Finance. The fundamental weakness of the local administration lay not only in the lack of policy and planning but also in the lack of funds. The Government, realizing the inadequacy of local funds at the time of the divisional boards, had proposed to contribute towards them and had made the 'Permanent Settlement' of 1927, under which contributions were made to local funds based on 'normal income' and 'normal and necessary expenditure'. The Permanent Settlement helped the local authorities to some extent but did not solve their financial difficulties. Owing to the restricted and rigid nature of the system, the Vernacular and Vocational Education Reorganization Committee, 1936, recommended that it be abandoned. Nevertheless, the Permanent Settlement, sometimes referred to as the 'Dunn Settlement', was still in operation until 1941.

Unlike the vernacular schools, the English and Anglo-vernacular schools were assured of a regular and flexible supply of funds. These schools were directly or indirectly supported by the Government and were at first given grants under the 'result grants' system. After 1918, however, they were given maintenance grants amounting to half the difference between their approved expenditure and the fee income, the rest being met from private funds. As this was found to be insufficient the quota of grants was revised on 1 April 1938, and the maintenance grants were raised to two-thirds of the difference between prescribed income and expenditure.

The English and Anglo-vernacular schools were not only financially aided by the Central Government, but they also came directly under its control. A Minister of Education was appointed in 1923. Under him was the Director of Public Instruction who was the executive Head of the Education Department and he was assisted by subordinate officials of the Department. Immediate control and supervision was carried out by the inspectors of schools. During the years 1937–38 the Inspectorate consisted of 8 inspectors, 8 assistant inspectors, 98 deputy inspectors, 1 inspectress, 6 deputy inspectresses, and 1 assistant inspector for physical training. The inspectors were required to send detailed reports to the Director of Public Instruction. The curricula and the syllabuses were also prescribed by the Education Department, though as time went on the Department gave more freedom to the heads of schools in these matters.

Apart from the central authority, there were also unofficial bodies which gave advice to these schools. The Educational Syndicate, instituted in 1886, served to keep the Education Department in touch with unofficial opinion. In 1921 the Syndicate was considered to have outlived its usefulness and it was dissolved and replaced by more effective agencies. They were the Anglo-vernacular and European School Advisory Boards, the Text-Book Committee, and a strong non-official element in the University Council and Senate. In 1925 the two Advisory Boards were amalgamated into one, the Secondary Schools Board which consisted of 20 members (12 non-official, 4 official and 4 University representatives). The function of this Board was to control the English and Anglo-vernacular high school and middle school examinations and to advise the Director in connection with secondary education. The compilation and codification of rules and regulations concerning the administration of secondary education was also improved about this time. Between 1918 and 1920 the cumbersome Burma Education Code was replaced by the Educational Rules for Anglo-vernacular and English Schools, the Grant-in-aid Code and the Burma Educational Calendar. These were considered to be more useful and compact publications, and they were still in use at the outbreak of World War II.

After the war the policies and recommendations of the pre-war educational authorities were often referred to and accepted as guiding principles. The war, however, offered an opportunity to make a clean sweep of the anomalies of the past and to conceive and introduce a new system of education more in accord with the social and economic needs of the country.

Reorganization of the secondary education system

In Burma, the term 'secondary education' is now applied to all forms of education above the primary stage, whether this follows the older secondary tradition or whether it has a technical, commercial or other bias. The application

is also made in terms of the ages of pupils concerned. The old parallel ladders of English, Anglo-vernacular and vernacular schools have been welded into one uniform system from the primary stage to the matriculation stage which is entirely state-provided and state-controlled. While putting an end to the system of aided schools of pre-war days the Government has not prevented the establishment of privately run schools, but has left the financing, control and administration of such schools to the respective school managers, subject to the Private School Registration Act of 1951 and the Private Schools Regulations of 1952. A distinctive feature of these regulations is that the schools follow the prescriptive syllabuses of work laid down by the Education Department and present their candidates for 7th standard and the High School Final and Matriculation Examinations conducted by the Government. The weakness of the present system lies here. The pupils in many of the private schools are trained to cram notes and synopses for examination purposes. To lessen the evils of examinations, the use of cumulative record cards, progressive cards and new acquittance certificates (a kind of leaving certificate), was introduced in 1959. With the new system of record cards firmly established it may be possible to explore ways and means to modify the present type of examination.

TYPES OF SECONDARY EDUCATION

Secondary schools, graded according to the nature of work and age-groups, are: middle schools (or junior secondary schools), from standard 5 to 7, for pupils aged 11 to 14 or over, and the senior level of high schools (or senior secondary schools), from standard 8 to 10, for pupils aged 14 to 16 or over. In December 1959 there were 518 state middle schools, with 170,177 pupils; 273 state high schools, with 47,431 pupils, 205 registered private high schools, with 18,518 pupils; and 125 unregistered private high schools. There are also 10 special middle school courses and 13 upper secondary educational institutions.

Examinations are usually conducted in March; the last day of this month is the end of the school year. The school year begins on 1 June every year. The first school term usually terminates about the middle of October, which coincides with the end of the Burmese Buddhist Lent. Holidays last about 10 days. The second term opens about the beginning of November or the last week of October. Another 9 or 10 days' holiday occurs at the end of that term, which falls somewhere round Christmas. The third term begins about the first week of January. Annual summer vacations are taken in April and May.

General secondary schools

To enter middle schools after completion of primary education, students must take the standard 4 regional examination, based on subjects taught during the fourth year in the primary stage and conducted annually in March. Entrance from middle school to high school is decided on the results of the middle school (or standard 7 examination), also held in March. Subjects are the main ones taught in the state middle schools—Burmese, English, mathematics (arithmetic, algebra and geometry) social studies (geography, history and civics) and general science. Besides these, domestic science (for girls), art and physical education, agriculture and industrial arts (for boys) are also taught in certain schools. Two years after passing the middle school examination, pupils are qualified to take the high school final and Matriculation examinations, the subjects for the latter being Burmese, English, mathematics, geography, history and civics, general science, additional mathematics, chemistry, physics and biology, economics of co-operation and agriculture. Subjects for the high school final examination may be taken from among the foregoing and also from among industrial arts, domestic science, art, elementary accountancy, English and Burmese shorthand and typewriting, secretarial practice.

Burmese, English and mathematics are compulsory and the rest optional. A candidate is required to pass in two optional subjects but may attempt three, the two best being taken for assessment. General science cannot be taken in combination with either physics or chemistry.

Matriculated students can proceed to the Rangoon and Mandalay Universities or to intermediate colleges in other localities for further studies. But those who pass the high school final examination and do not intend to enrol at the universities may enter various institutes providing vocational education—technical, veterinary, agricultural—teacher training colleges, schools for the army, the police, the post and telegraph and public health services, accountancy classes, forestry training, etc.

Aims. The aims of secondary education are:

1. To ensure a knowledge of the three R's among all citizens of the Union.
2. To ensure the production of a sufficient number of technicians and technologists.
3. To train and equip young men and women so that they can adequately and efficiently perform their various duties as citizens of the Union.
4. To eradicate illiteracy and produce men and women who possess the 'Five Strengths' (physical, intellectual, moral, social, economic).
5. To perpetuate democracy within the Union.

Summing up, the aim is to give a liberal education and technical training based on secondary education, in order to help pupils become useful elements in the community and the nation and to elevate general cultural standards and help pupils acquire professional skills.

Curricula. The definition of the aims of secondary education created the need to design appropriate curricula. For this purpose, under the direction of the Education Ministry, the Curriculum Development Branch of the Directorate of Education compiled 'Syllabuses for the Welfare State' in 1954 and distributed it to all schools. Each school is expected to formulate its curricula on the basis of the course of study and operate them to suit the pupils' special local interests and capacities and the actual conditions of each school.

In some schools in Rangoon, hours have been set aside for extra-curricular activities.

The names of study subjects have not been changed, but

the content and the methods of teaching them have been improved. For instance in the study of English, besides reading and writing, audio-visual aids are used to accustom pupils to hearing and speaking the language.

Religious teaching and moral instruction are provided for non-Buddhist pupils but the whole of school life is regarded as a part of moral training. For teaching materials, teachers are instructed not to depend solely on textbooks. Many guidance books for teachers are compiled and distributed to schools all over the country. Seminars, conferences and refresher courses are also sponsored by the Ministry of Education.

A flexible policy has been adopted by which the total school hours in any year are allotted with due regard to the functions and significance of subjects. The apportioning of periods for subjects was revised in June 1959. In middle school courses the subjects studied and the number of periods allotted to them per week are: Burmese, 5; mathematics, 9; geography, civics and history, 5; general science, 3; English, 10; domestic science, agriculture, industrial arts and art, 2; physical education, 1.

In high schools, 6 periods are allotted for Burmese, 10 for mathematics, 10 for English and 10 for optional subjects. A teaching period lasts 40 or 45 minutes.

Teaching staff. The qualifications of middle school teachers and high school teachers are not the same. The latter are required to possess a university degree and a teacher's certificate; the qualifications of the middle school teacher are a pass in the Matriculation or high school final examination and a certificate for Junior Assistant Teachership.

Training of senior assistant teachers for high schools is provided in the Faculty of Education under the administration of the University of Rangoon. The three grades of training are: (a) a 2-year course leading to B.A. (Ed.) for those who have passed the intermediate examination; (b) a 1-year course leading to a Diploma in Teaching for those who have passed the degree examination; (c) the Bachelor of Education degree in 1 year for those who have passed either B.A. (Ed.) or D.T.

Training of junior assistant teachers for middle schools is provided in two training colleges for teachers, one at Rangoon, and another at Mandalay. Those who have passed the high school final or Matriculation examination are eligible for admission. The duration of the course is 1 year. Subjects include educational theory and practice, handicrafts and methodology. Special training courses in the teaching of English, general science, agriculture, industrial arts, domestic science, physical education and art are given. Those who specialize in these subjects are appointed as subject teachers in state schools on the completion of the course.

Vocational and technical schools

The Reconstruction Committee of 1947 stated, 'We are generally in agreement with the observations and recommendations of the Campbell Committee (1936) in regard to vocational training. Side by side with the redesigning and reconstruction of the ordinary school system, technical, vocational and professional instruction in the non-university institutions will have to be revised and a system of trade schools and polytechnical institutes developed to meet the local occupational needs, large-scale industrial and commercial needs and the needs of the public utility services and communications for technical skills and training.'

In accordance with the recommendations of the Reconstruction Committee and those of the Campbell Report, the secondary education institutions are charged with the task of preparing pupils to continue in various directions. The curricula for state middle and high schools, with the introduction of the technically and vocationally biased subjects, have become richer and more closely integrated with life. Bifurcation after primary, middle and high school stages respectively is helping pupils to choose suitable courses and to take up vocations for which they are fitted, instead of automatically moving on to the university. The following facilities are provided for vocational education.

For pupils who have successfully completed their primary education and who have not the means to go to an ordinary secondary school, vocational training is available at the artisan training centres at Rangoon and Mandalay, the District Police Training Depot, nursing classes and agricultural middle schools, etc.

On successful completion of the middle school course, pupils who want vocational training may enter any of a number of state institutions: agricultural high schools, technical high schools, pre-medical classes in state schools, rural development training courses, teacher training institutions, commercial schools, midwife and nurse training schools, children's welfare training institutes, etc.

Instruction in domestic science is given in 42 state middle and high schools. Girls can take domestic science as an alternative to industrial arts which is also provided in the curriculum. Home economics, home nursing, cooking, stitching and knitting, sewing, dressmaking, mothercraft and first aid are taught in this course.

Industrial arts is now taught in 52 state high schools, agriculture and animal husbandry in 37 state high and 12 state middle schools. Two state high schools, one in Rangoon and one in Mandalay, are teaching commercial subjects: shorthand, typing, elementary accountancy, book-keeping and commercial correspondence.

Technical or industrial arts subjects taught at the middle school stage are paperwork, ceramics, technical drawing, woodwork, metal work, cane and bamboo work.

At the high school stage, in addition to the subjects taught in middle schools, woodwork, engineering, workshop and machine shop practice and leather craft are taught.

Two government technical institutes, one at Insein and the other at Mandalay, provide technical courses of 3 years' duration. Successful candidates in the high school final and Matriculation examination and the Technical high school examination are admitted to these institutions on passing the entrance examinations. Only those under 20 years of age are selected for admission and each student receives a monthly stipend of 60 kyats for three years. Subjects taught include construction technology, railway, highway and public works engineering, machine tools and design, electric power generation and distribution, electrotechnology, mining technology, etc.

One state technical high school has been opened at Rangoon. The course provided is one of 2 years, and

residential pupils are accepted. Pupils must be under 19 and have passed the middle school examination. Those selected for admission receive stipends of 50 kyats per month.

Matriculation subjects such as English, Burmese, mathematics, chemistry and physics are taught and each pupil must choose one of the technical subjects, namely radio, electrical wiring, automobile mechanics, diesel engines, machine shop practice, sheet metal working, welding and building.

There are two artisan training centres, one at Rangoon and another at Mandalay. Pupils are selected from those who have passed the middle school examination and each selected pupil receives a government stipend of 50 kyats per month. The training course lasts 2 years and covers both theory and practice. Pupils are required to specialize in any one of the following subjects; radio, electricity, machine shop practice, diesel engine repair and maintenance, automobile mechanics, blacksmithing, fitting and welding practice, foundry and moulding practice, and carpentry.

Agricultural schools. For pupils with an aptitude for agriculture and likely to benefit from early training, two state agricultural middle schools, two high schools and one agriculture institute provide consecutive courses.

On completion of primary school, a pupil can enrol at a state agricultural middle school where agriculture is taught (both theory and practice) as the main subject for 3 years, along with other subjects of the ordinary middle school curriculum.

Those desiring to study further can attend one of the two state agriculture high schools. The duration of the course is 2 years and there is an agricultural high school examination at the end of the course. Government stipends are available. More advanced studies in agriculture are provided at the State Agriculture Institute, Pyinmana. Efforts are being made to secure direct admission of those who successfully complete the diploma course in Pyinmana to the Agriculture College, University of Mandalay, so that they may qualify for the B.Sc. degree in agriculture without having to pass the intermediate science examination of the University.

Subjects taught in the State Agriculture Institute are agricultural economics, agronomy, horticulture, plant protection, chemistry, farm mechanics, botany, physical education, extension methods, animal husbandry, and agricultural education.

Other schools

Two Cultural Institutes, one in Rangoon and one in Mandalay, were established in June 1952 and 1953 respectively under the Ministry of Culture. Instruction in music, drama, dancing and art are given both for the primary and secondary stages. The course is of 3 years' duration. A National Library, National Museum, National Gallery of Art, Academy of Art and a National Academy of Music, Drama and Dancing are maintained. Evening classes for these courses are also provided.

Out-of-class activities

The importance of the physical development of children is fully recognized and sports and games of various kinds are encouraged. School and inter-school sports are held annually.

TRENDS AND PROBLEMS

It is a truism that education is conditioned by and conditions society. Educational aspirations must be in harmony with the State of social development and the cultural and economic needs of a country.

The greatest need that faces Burma, as a newly independent nation, is to have a sufficient number of well-trained men to manage the country's affairs and to develop a sound and stable economy. A balanced economy requires improved methods in agriculture and the installation of suitable industries, and consequently particular care must be taken to train men in scientific and technical skills. It is the work of the secondary schools, together with the universities and other institutes, to provide suitable education and training. Burma, as a democratic nation, also desires to extend equal educational opportunity to as many people and at as high a standard as possible. One of the greatest faults in secondary education in the past was that it benefited only a small section of the population, and for only a limited purpose. The steady growth of secondary schools and the all-out efforts to provide technical and vocational as well as academic education in the secondary course are evidence of the fact that past mistakes are being remedied.

STATISTICS

Total population (mid-year 1958 estimate): 20,255,000.
Area: 261,757 square miles; 677,950 square kilometres.
Population density: 77 per square mile; 30 per square kilometre.

Summary of school statistics, 1953–57. Enrolment in public educational institutions from primary to university level numbered 1,617,050 pupils in 1957/58, representing 8 per cent of the estimated population. Some 85 per cent of this

enrolment was in primary schools, 14 per cent in general secondary schools and under 1 per cent at universities. No data are available for recent years on the proportion of girls enrolled. In 1954 girls made up approximately 41 per cent of enrolment in primary schools, 43 per cent in general secondary education and 24 per cent at universities. The teaching staff in primary and general secondary schools numbered nearly 40,000 in 1957/58, an increase of 43 per cent compared with 1953/54. The pupil-teacher ratio in primary schools increased to 41 in 1957/58 against 34 in 1953/54 and in general secondary schools the ratio was approximately 33, compared with 18 at the beginning of the period under review. This development is due no doubt to the very rapid expansion of enrolment in recent years. Since 1953/54, enrolment has increased by 78 per cent in primary schools, more than doubled in general secondary schools, and risen by over 50 per cent at universities. On the other hand, emergency teacher training courses ceased in 1957 and enrolment in teacher training schools at secondary level has steadily declined over the period under review. No data are available for recent years on higher teacher training institutions. (See Table 2.)

Enrolment trends in secondary education, 1934–57. From 1935 to 1939, average enrolment in general secondary education (public and private schools) was 219,000 students, giving an enrolment ratio of 14 in relation to the estimated age group 15–19 years old. Girls made up 10 per cent of enrolment over this period. There was a very severe setback in education between 1945 and 1950 when average secondary enrolment declined to only 23,000 pupils. From 1950 onwards, however, secondary education has steadily expanded and in the years 1955–57 the ratio of general secondary enrolment (public schools only) to the school age population 15–19 years old rose to 11. The proportion of girls enrolled, moreover, increased to over 40 per cent of the total between 1950 and 1954. Data on secondary vocational and teacher training enrolment are incomplete. (See Table 3.)

Educational finance 1958. Total expenditure on education in 1958/59 (fiscal year beginning October) was 158 million kyats, representing about 8 kyats per inhabitant. Of this total, about one fifth was for capital expenditure. (See Table 1.)

Note. From 1934 to 1949, figures refer to government schools and recognized aided and unaided middle, high and post-primary schools. From 1950 to 1957, data refer to public schools only.

1. General secondary education only.
2. Commercial schools only.
3. Commercial, technical and industrial schools.
4. State technical high schools and artisan training centres only.
5. The decrease in teacher training since 1957 is due to elimination of emergency training schemes.

BYELORUSSIAN SOVIET SOCIALIST REPUBLIC

THE EDUCATIONAL SYSTEM

Before the Great October Socialist Revolution, Byelorussia was a backward borderland of Tsarist Russia, with 80 per cent of the population illiterate. The primary school system was extremely limited, and there were only a few general or technical secondary schools—*gymnasia*, *real* schools (general secondary schools), and technical and commercial schools (specialized secondary schools)—which charged fees and which practically none but the children of well-to-do parents were able to attend (only 8 per cent of the total number of pupils came from workers' or peasants' families).

After the Revolution, the tremendous task of organizing a new school system was undertaken. The 'Declaration of rights of the peoples of Russia', adopted by the Soviet Government, proclaimed the equality of all the previously oppressed nationalities and their equal rights to free political, economic and cultural development. On the basis of the Declaration, the RSFSR People's Commissariat for Nationalities was set up with national cultural and educational departments, including one for Byelorussia, and as a result of the department's work a People's University was opened in Minsk on 14 February 1918. A start was also made with the establishment of state schools, with instruction in the Byelorussian language. An important factor in raising the standard of school learning was the Soviet Government's decree, over Lenin's signature, on the separation of the Church from the State and the school from the Church; the decree made it illegal to teach religious doctrine in any educational establishment.

The Byelorussian Soviet Socialist Republic was set up on 1 January 1919, and the creation of the sovereign Byelorussian Soviet State and the reconstruction of social life in accordance with socialist principles provided the basis for a rapid victory over economic and cultural backwardness. On 3 January 1919 the Government of the Republic set up a People's Commissariat for Education.

One of the most urgent problem in transforming the schools into an instrument for the Communist education of the workers was the need to develop the principles laid down by the Soviet authorities for school and educational work—the introduction of free and compulsory general and polytechnical education for all children of both sexes and strict observance of the principles of a unified labour school and instruction in the pupils' mother tongue.

The equal right to education enjoyed by all citizens is guaranteed by the organic law of the Byelorussian SSR—the Constitution.

In 1920, for the first time in Byelorussia's history, a unified labour polytechnical school providing general education was established by decision of the All-Byelorussian Congress of Soviets. The length of the school course was to be 7 years, comprising 4 years of primary education, for children aged 8 to 12, and 3 years of secondary education, from age 12 to 15.

This 7-year school provided the requisite training for admission to the technicum (*tehnikum:* specialized secondary school). Considerable attention was also focused on the establishment of vocational schools, which were essential in order to cope with the specific tasks facing the Republic at a time when the national economy was being re-established and developed; this initial system was later modified in accordance with the requirements of the developing national economy and culture of the Republic.

Vocational and technical schools began to be opened, including factory schools and workshop apprenticeship schools (based on the primary school), vocational schools and courses, technicums and educational industrial workshops based on the 7-year schools. To train workers as medium-level specialists in various branches, a network of industrial, agricultural, building construction, medical, teacher training and other types of technicum was developed from 1920 onwards. The following year saw the foundation of the Byelorussian State University. The development of secondary vocational and technical education and higher education facilitated the training of young workers and peasants as leading intellectual workers, and this new intelligentsia played a great part in the development of industry, the reconstruction of agriculture along socialist lines and the raising of the cultural standards of the Byelorussian people.

In 1931, the Byelorussian Government decided in favour of developing a 10-year polytechnical school, and by the end of 1932 the structure of the national education system was as follows: kindergarten (age-group 3–7), primary school (with 4 years' education), 7-year school (with 3 years' education following the primary classes) and secondary school (with 3 years' education following the 7-year school). The technicums and vocational-technical schools followed on the 7-year school, and graduates of general secondary schools, technicums or vocational schools based on the 7-year school could immediately proceed to a higher educational establishment.

The headlong economic development of the Byelorussian SSR produced a demand for enormous numbers of specialists in all branches of the national economy and cultural work, and the network of specialized and higher educational establishments spread rapidly. But the invasion of the country during the second world war interrupted the general progress. For three years the Byelorussian SSR was occupied by enemy forces, who inflicted vast damage on the national economy. Almost all the schools were destroyed and the material losses suffered by educational establishments coming under the administration of the Byelorussian Ministry of Education amounted to 2,500 million roubles. After the war, practically the whole of the educational and material infrastructure of the schools, vocational training establishments, technicums and higher educational establishments had to be supplied anew, and new school buildings, hostels and housing accommodation

had to be built. This was achieved in a very short time. As early as 1945–46, there were 26,221 pupils attending 94 technicums and other schools, while in the school year 1957–58 there were 57,300,000 pupils attending more than 100 technicums and other schools.

The existence in Byelorussia of a wide network of specialized secondary and higher educational institutions has made it possible to increase the number of specialists with a higher or secondary education almost threefold as compared with the pre-war period.

Administration

The administration of public education in the Byelorussian SSR is in the hands of the Council of Ministers, acting through the Ministry of Education. The Minister of Education is responsible to the Supreme Soviet and to the Government of the Republic for the work of his Ministry and of all educational establishments.

The faculties of the pedagogical institutes and the Pedagogical Research Institute which come under the direction of the Ministry are responsible for drawing up school curricula and syllabuses and for producing textbooks and manuals. The Ministry has its own educational publishing house, which issues textbooks, handbooks, directives on teaching methods, scientific and literary works, and material dealing with pedagogical questions and teaching methods.

The schools are administered directly by the district education departments coming under the Ministry and the executive committees of the Soviets of Workers' Deputies, to which public education boards are also attached.

Supervision and inspection. The supervision and regular inspection of schools and teachers is an important factor in raising the standard of the work.

The supervision of the proper organization of secondary school work is carried out by inspectors attached to the area, municipal and district education departments and the Ministry, who see that the laws of the Supreme Soviet, the Government's decisions and the Ministry's directives are observed and verify the standard of general instruction and the organization of educational work in schools and other educational institutions.

It is the school inspector's duty not merely to supervise the schools but also to assist them in carrying out their tasks successfully by giving advice and making recommendations. His main concern should be to produce an all-round improvement in the quality of instruction and education, and see that teaching activities are properly organized. He is expected, above all, to have a sound and thorough knowledge of the work of the schools and the public education authorities, to be constantly studying outstanding results obtained in educational work and disseminating them among schools, and to bring about a steady improvement in the standard of work done in the establishments coming under his supervision.

School inspectors are appointed from among people who have taken a course of advanced teacher training or have had a university education, and who have completed the requisite number of years service in an administrative and pedagogical capacity.

Inspectors attached to district education departments must have had not less than 5 years' service, those attached to municipal and regional education departments not less than 7 years' service, and those attached to the Ministry of Education, not less than 10 years' service. As a rule, school inspectors are appointed from among the best teachers and headmasters with a record of wide practical experience.

A great deal has been done in recent years to increase the number of inspectors and improve the qualifications of education department workers. The Byelorussian Institute for In-Service Training holds monthly courses, which have been attended over the past few years by all inspectors and heads of district and municipal education departments. These courses make a point of giving education department workers practical instruction on questions of inspection and supervision, and of raising the level of knowledge of teaching methods and polytechnical subjects.

Finance. All educational establishments and bodies administering them are fully financed from the state budget of the Republic. School budgets are fixed in relation to the number of pupils and classes in each school. The teachers are paid in accordance with their educational level and length of teaching service. The rates of pay for teachers of grades 1-4 are based on a 24-hour working week or a 4-hour working day, and those for teachers of grades 5-11 on an 18-hour working week or a 3-hour working day. In addition, teachers receive extra pay for correcting pupils' exercise books (subjects: mother tongue, Russian, foreign languages, literature and mathematics). Teachers who act as class leaders or are in charge of subject-rooms or workshops, or who give out-of-class instruction in physical culture, also receive extra pay for these types of work.

Teachers' pay rises by increments of 10 per cent after 5, 10 and 25 years. After 25 years' service they receive a service pension at the rate of 40 per cent of their pay.

All schools in the Byelorussian SSR are part of the state educational system. Teachers' salaries are untaxed. In the vocational secondary and higher educational establishments there is a system of state scholarships which are awarded to all successful pupils and students.

Buildings and equipment. The construction of school buildings and the provision of the necessary equipment are financed from the state budget and from public funds. The executive committees of the Soviets of Workers' Deputies help public and co-operative organizations by providing them with building materials.

The Ministry of Education supplies standard plans for school buildings, and makes grants to cover the cost of the necessary equipment and visual aids. The standard plans are prepared in full accordance with the requirements of school hygiene and optimum conditions for the work of the school. The classrooms are built to a specification of 1.25 square metres per person, while the plans also provide premises for school laboratories, school workshops, the school doctor, teachers' rooms, recreation rooms, gymnasi-

ums, etc. Space is also allowed for a dining-room or buffet. The school equipment must also conform to the requirements of school hygiene, and the classroom furniture is selected to suit the pupils' age-group.

School welfare services. School children, like all citizens of Byelorussia, are entitled to free medical attention. For secondary school pupils it is provided by special school doctors appointed by the public health authories, and by school nurses.

TYPES OF SECONDARY EDUCATION

In 1959, the Supreme Soviet of the Byelorussian SSR adopted the law on strengthening the ties between school and life and on further developing the public education system in the Byelorussian SSR, under which an 8-year period of universal compulsory education is being introduced in the Republic, meaning that all children between the ages of 7 and 15 or 16 will attend school. All the Republic's 7-year schools are to become 8-year schools, and this change marks a further advance in the public education development. The 8-year school is an incomplete secondary labour polytechnical school providing a general education.

Its main objects are to prepare pupils for life and for socially useful work, raise the standard of general and polytechnical education, produce educated people with a sound knowledge of the basic sciences and train young people in a spirit of deep respect for the principles of socialist society, and in the spirit of the ideas of Communism. The guiding principle of school education is the close link between education and work—the practical work of Communist construction.

The 8-year school gives pupils a firm grounding in general and polytechnical subjects, inculcates a love for work and a readiness to undertake socially useful activities, and caters for the moral, physical and aesthetic education of the children.

The educational work at the 8-year school is based on combining fundamental science teaching polytechnical and labour training, and getting the children to engage extensively in socially useful work of a type suited to their age.

The Byelorussian schools do not apply any special tests for assessing pupils' abilities, and the extent to which the latter have assimilated the subject matter prescribed in the syllabus is gauged by the five-mark system, which is used in all schools.

It is not the object of the 8-year school to prepare pupils for any particular occupation. The purpose of the work lessons is to help pupils to visualize certain production processes more clearly, acquire basic habits of work and observe the practical application of scientific laws in various productive processes.

On completing their 8-year schooling, pupils are free to choose which branch of education they wish to pursue.

For completing secondary education following the 8-year school, the following main types of educational establishment have been introduced: a secondary labour polytechnical school providing a general education together with production training (hereinafter termed 'senior secondary polytechnical school'), a school for young workers and peasants, technicums and other specialized secondary educational establishments, and vocational-technical schools.

The senior secondary polytechnical school

This school provides a complete secondary education and vocational training for work in one of the branches of the national economy, and offers a 3-year course (grades 9, 10 and 11), after completing which the pupil is eligible to enter a higher educational establishment or take a job for which his vocational training at the school has fitted him. One-third of the teaching time at this school is devoted to vocational training. Unlike the 8-year school, where the industrial work done is of an educational and character-forming nature, production training at these schools is conducted directly in factories and workshops, on state, collective farms, experimental farms, and building sites, and in the school production training workshops. It is carried out under the guidance of the physics, chemistry, mathematics and biology teachers if they have received the supplementary training needed for such work, or by specialists from industrial and agricultural enterprises—engineers, technicians, builders, technologists or agronomists. Two days a week are normally set aside for production work and training, with a maximum 6-hour working day. The pupils receive wages for the work they do.

Production work is not something isolated from the study of general educational subjects, and the pupils make use of the theoretical knowledge they have acquired and apply it in practice.

The trade which the pupil has learned at school is not necessarily his life occupation. He may, if he wishes, change his occupation at his actual place of work, where various courses are offered.

There are also other types of complete general secondary school in the Byelorussian SSR. For example, for children who are specially gifted in music, painting or dancing, there are complete secondary schools with a bias in one of these directions. Great attention is paid to the instruction and education of physically handicapped children, for whom special schools have been set up. The cost of educating children at these schools is borne entirely by the State. Apart form general education, the children attending these schools receive vocational and labour training.

Some of the 8-year schools and senior secondary polytechnical schools are boarding schools in which pupils are placed at their parents' request. The cost of maintaining orphans and children from large families at these schools is borne entirely by the State. By 1965 the number of children at boarding schools will total 112,000.

Starting on 1 September 1960, schools will be opened at which children and adolescents will spend the entire day. Parents who place their children in these schools can work at their factory without anxiety, in the knowledge that their children are spending their time throughout the day under the guidance of teachers, preparing lessons, going for walks, playing games, working, or in some other useful way, and that they have a hot meal twice a day. The cost of maintaining schools with this extended day will be borne entirely by the State.

Evening (shift) and correspondence schools providing a general secondary education

Byelorussia has a wide network of evening (shift) schools which provide a general secondary education and the Law of 1959 provides for the further extension of this network. Evening (shift) schools and correspondence schools cater for young workers and peasants, or for adults working in production or in various institutions, who have not had a full secondary education but would like to do so. The instruction given is spare-time, and those wishing to obtain a secondary education can attend one of these schools at hours convenient to themselves, without giving up their job. For the greater convenience of workers, the tuition may be given in the evening, at times to suit shift workers, or by correspondence, and in rural areas it is given on a seasonal basis.

The course covers 3 years, and those who complete it have the right to enter a higher educational establishment. The ground covered is the same as at ordinary secondary day schools.

Students taking correspondence courses or attending evening (shift) schools enjoy various privileges, such as extra leave with pay, extra days off, etc.

Technicums and other specialized secondary schools

These have been developed on a wide scale in the Byelorussian SSR. They take graduates of 8-year schools, and give them a complete secondary education and the course at these qualify them as medium-level specialist, with eligibility to enter a higher educational establishment. There is an entrance examination covering the 8-year school programme.

The technicums train specialists for work in industry or agriculture, or in public health, educational or cultural institutions. The course covers 3–4 years. Some of the technicum departments now offer a short course of 2 years for entrants who have already completed the full secondary course.

Technicum pupils who have successfully completed the theoretical part of the course in the set time as well as the course of school work and production work are required to sit for the state examinations or defend their diploma thesis before the State Qualifying Board, after which they are awarded a technicum leaving diploma specifying the qualification they have acquired.

Apart from a general secondary education, the pupils at specialized secondary schools are given the requisite theoretical and practical training in a particular speciality, while in technical and agricultural specialized secondary schools they qualify and obtain a classification rating in a particular trade.

In addition to day technicums and specialized secondary schools, there are correspondence and evening technicums and departments at regular schools. They are intended for young people and adults working in production or in institutions who have not had a complete secondary education, and who attend the courses in their spare time. Thus all workers have an opportunity to continue their studies to higher education level.

Vocational-technical schools

The object of these schools is to train skilled workers for the various sectors of the national economy. They take young people who have completed the 8-year school and wish to work in production. There are urban and rural schools, and they specialize in the various branches of production and provide training on the basis of participation in productive labour in close contact with industrial enterprises, construction works and collective and state farms.

These schools do not provide a complete secondary education, and the school-leavers are free to work in production and continue their education through the correspondence departments of technicums, at evening (shift) schools or at correspondence secondary schools. The subject matter to be taught in these establishments is laid down in the curricula and syllabuses and must conform to trade requirements. The pupils are given a basic acquaintance with their trade in the school workshops or on specially equipped farm-plots, but the final stages of training are conducted at factory workshops, on building sites, on collective or state farms or in some other enterprise, depending on the trade chosen. The course lasts from 1 to 3 years, depending on the degree of complexity of the trade. Pupils receive an apprentice's wages, while in the case of orphans and children from large families the State bears the cost of maintenance.

Teacher training schools

A great deal has been done in the Republic under the Soviet regime to train qualified teachers matching up to the tasks facing the schools. At present (1959), there are 82,708 teachers employed in Ministry of Education schools, including 22,682 with higher educational qualifications, 20,884 who have completed a course at a teacher-training institute and 33,466 who have completed a secondary course in teacher training.

The last-mentioned receive their training at teacher training schools, of which there are eight in the Republic. They train kindergarten teachers, teachers for grades 1–4, teachers for music and singing, etc.

They take graduates of incomplete secondary schools, but in line with the introduction of compulsory 8-year education, will require pupils to have completed the 8-year school. The course takes 4 years. Pupils who have had a complete secondary education are also admitted, and there are departments for them which provide a shortened course of 2 years.

There is an entrance examination, and the pupils' success is evaluated on the basis of their class marks and examination results. Their achievements and behaviour are assessed on the five-mark system, with five as the top mark.

The school year is divided into two terms, and the curriculum prescribes the amount of time to be devoted during the year to theory, class work and teaching practice, as well as length of the holiday and examination periods. The curriculum includes both general and special subjects, as well as physical culture, handwork, drawing and singing.

Special attention is paid to the study of teaching methods for all subjects included in the primary school curriculum,

and to pedagogical science and history, school hygiene and psychology. A considerable proportion of the time is devoted to teaching practice in primary schools, during the course of which note is taken of the student's ability to conduct out-of-class and out-of-school work with the children.

Out-of-class activities

Out-of-class and out-of-school work with schoolchildren is widely developed in the Byelorussian SSR through the organization of groups of various kinds and mass activities, and by drawing the children into socially useful labour. By taking part in practical activities within their powers, they are able to get a better idea of their own abilities and talents. The forms and content of out-of-class work cover a wide range and include educational work, out-of-school reading, technical studies, agricultural biology, sports activities, amateur art-work, excursions and touring, various games and so on.

More and more children are being involved in the work of sports sections and in large-scale physical culture activities. The number of children taking part in physical culture contests and competitions has also increased considerably. In 1959 it exceeded 800,000.

An important part of out-of-school work is aesthetic education, and the young people are given ample opportunity to develop their abilities and gifts. There are choirs, clubs for art and recitation, dramatic and music groups, and folk instrument orchestras. In all these art groups, the children's ability in any particular direction is discovered and developed.

Out-of-school reading is also given a great deal of attention. The Republic has a wide network of children's libraries, which hold readers' conferences and stage discussions on children's books. There is an annual Children's Book Week, and children's libraries and the children's sections of adult libraries arrange meetings between the authors and their young readers.

Out-of-school establishments for children play a very important role in out-of-school activities. In the Byelorussian SSR there are 13 Young Naturalists' Centres and two Young Technicians' Centres, 47 children's sports schools, 80 Young Pioneer homes and 8 children's holiday and excursion centres. The Byelorussian Government and trade unions spend large sums on recreational facilities during the summer and winter holidays. A large number of Young Pioneer camps, sanatoria and tourist centres have been set up and equipped, while, for children who for one reason or another stay in town during the summer, the house committees set up children's playgrounds. All these institutions are equipped with sports material, games, libraries and fiction librairies. The parents' committees attached to schools and the trade union and Young Communist organizations are active participants in all this work.

TRENDS AND PROBLEMS

The continued technical advances in all sectors of the national economy are producing an ever-growing demand for higher qualifications on the part of the workers and collective farmers, and the development of vocational and technical education for young people and an improvement of the standard of training for specialized workers in all economic sectors is particularly important in this connexion.

The Soviet school is required to play an active part in all aspects of creative activity in which the Soviet people is engaged, and it has become necessary to establish even closer links between school instruction and life—the actual work of Communist construction—and raise the standard of the general and polytechnical education of young people still higher.

CAMBODIA

THE EDUCATIONAL SYSTEM

After successfully completing the 6-year course of primary education, Cambodian pupils of both sexes can continue their studies in the various branches of secondary education: general secondary education, given at the *collèges* and *lycées;* technical secondary education, given at the National School of Arts and Crafts, the National School of Commerce, the School for the Training of Assistant Chemical Research Workers, the Kompong-Cham Technical College and at certain vocational training schools, such as the agricultural schools, the School for Assistant Public Works Engineers, and the School for Railway Apprentices; teacher training, provided at the National Teacher Training Institute at Phnom-Penh and at the Teacher Training Centre at Kompong-Kantuot.

Further, at Phnom-Penh, there is an apprenticeship centre which is open to pupils of all ages, provided they have completed their fifth year of primary studies and pass a competitive entrance examination.

Besides the courses at secondary level, instruction of post-secondary standard is given at the National School of Commerce and the National Teacher Training Institute. There are three institutions of higher education: the Law Faculty, which grew out of the former National Institute of Legal, Political and Economic Studies; the Royal School of Medicine, which comes under the Ministry of Public Health; and the Royal School of Administration, which comes under the Prime Minister's Department. In addition, a number of bursaries are available to enable selected students to pursue higher studies abroad. The structure of the Cambodian school system is shown in the diagram on p. 309.

SECONDARY EDUCATION

The aim of secondary education is to continue the intellectual training which Cambodian youth began at the primary schools. In order to be able to pursue their studies at secondary schools, pupils of the higher primary classes must pass a competitive entrance examination. The number of vacancies is fixed by a ministerial order (*Prâkas*), which is submitted to the Council of Ministers for its approval. Candidates for the competitive examination must be not less than 11 nor more than 16 years of age during the year when they sit for the examination. They must have completed their primary studies and present a school record book containing an appraisal of their work by the head of the school they attended.

Administration

Secondary education is administered by two Directorates, assisted by two Technical Councils: the Directorate of Secondary and Higher Education, which is also responsible for teacher training, and the Directorate of Vocational and Technical Education. Owing to their special nature, certain technical schools are directly subordinate to the Ministry of Public Works and the Ministry of Agriculture.

Each *lycée* is directed by a principal (*proviseur*), who is assisted by a vice-principal (*censeur*), a general supervisor and a bursar (*économe*). The principal co-ordinates the work of all the members of his staff and may inspect the classes during lessons. He signs all documents relating to his school and intended for outside services. All expenses for the management of the *lycées* are paid out of the national budget.

Each *collège* is directed by a head (*directeur*), who is assisted by a general supervisor and a bursar; he has the same duties and responsibilities as the principal of a *lycée.*

All expenses for the construction and equipment of schools are paid out of the national budget, but since Cambodia obtained its independence many school buildings destined for secondary education have been built with the help of funds provided by private persons or by the local association for the development of education. State secondary education is free but not compulsory.

The funds allocated to secondary education for the school year 1958/59 amounted to 262,684,250 riels, including 145,734,390 riels for staff, 84,696,200 riels for equipment and 32,286,830 riels for school building.

TYPES OF SECONDARY EDUCATION

General secondary schools

These schools provide a 7-year course divided into two stages, the first stage lasting 4 years and the second, 3 years. Entrants must be not less than 11 nor more than 16 years of age.

The aim of general secondary education is to provide Khmer youth with a humanistic training, i.e., to develop the intelligence and personality of the pupils, to inculcate in them a love for national and international culture and civilization, and to arouse their interest in science and technology.

The following secondary school certificates are conferred: the *diplôme d'études secondaires du premier cycle* (lower secondary school certificate), upon completion of the first stage of secondary education (4 years); the *baccalauréat de l'enseignement secondaire*, which is taken in two parts, the first after 2 years and the second after the third year of the upper stage.

These certificates are conferred on candidates who pass an examination, for which the board of examiners is composed of Cambodian secondary school teachers, under the chairmanship of the Minister of National Education or his delegate.

The study plans and curricula of secondary education are the same for all Cambodian *collèges* and *lycées*, both state and private. They are, as a rule, drawn up by the Council of Secondary Education and Council of Higher Education; but teachers are allowed a certain latitude in the theoretical and practical application of these plans and curricula.

The Council of Secondary Education consists, as a rule, of the Minister of National Education, the Director of Secondary Education and secondary school teachers.

The Minister is responsible for ensuring the application of the curriculum on the local, regional and national levels.

General secondary education is, in a way, the continuation of primary education, but, whereas, during the primary course, only the rudiments of the various subjects are taught, secondary education aims at developing this knowledge with a view to providing pupils with general culture.

The requirements of higher education exercise an influence over the secondary school curricula. That is why, during the final year of the second stage, pupils wishing to specialize in one of the branches of higher education are allowed to choose one of three different classes: the philosophy class, for those wishing to specialize in literature; the experimental sciences class, for those who will be preparing for careers in medicine, pharmacy, etc. and the elementary mathematics class, for those whose university studies will call for specialization in this field.

The time-table, with philosophy as the option, is shown in the table opposite.

If, during the seventh year, the pupil chooses the experimental sciences class he does less philosophy and the time-table for that year is as follows: mathematics, 4 hours; physics and chemistry, 5; natural sciences, 4; philosophy, 5; Indo-Khmer literature, 2; English (or another modern language), 1; history and geography, 4; physical education, 1; total number of hours, 26. If he chooses the elementary mathematics class, the time-table is as follows: mathematics, 9 hours; physics and chemistry, 6; natural sciences, 2; philosophy, 3; Indo-Khmer literature, 2; English (or another modern language), 1; history and geography, 4; physical education, 1; total number of hours, 28.

The subjects included in the secondary school curriculum are adequately co-ordinated. The history programme, for instance, is designed to facilitate the study of Khmer literature, whereas the programme of Indo-Khmer literature is intended to facilitate the study of history in the terminal classes. The programmes are completed by practical work in the laboratories, manual work (modelling, gardening, carpentry), as well as by various new subjects (singing and music, dramatic art, typing, accountancy).

In Cambodia, there are 31 state *collèges* and *lycées* as well as 44 private colleges in the different provinces, and, at Phnom-Penh, a Lycée Français which is conducted by the French Cultural Mission. The total number of pupils attending the state secondary schools is 19,267.

Since the proclamation of the national independence, one of the Government's main preoccupations has been the training of Cambodian secondary school teachers. The National Teacher Training Institute, which was set up in Phnom-Penh, is intended to give future teachers a general training higher than or at least equal to that given during

1. Or another modern language.

the second part of the course for the *baccalauréat*. This course is completed by professional training, which comprises the study of psychology and pedagogy, practice teaching of the subject chosen and a *stage* (series of demonstration lessons) under the control of the headmaster. Lastly, courses in Indo-Khmer culture and courses in general culture provide student teachers with a comprehensive picture of the main human civilizations and the principal branches of learning.

The National Teacher Training Institute comprises 8 sections which correspond to the subjects chosen by the students: Khmer language, French language, English language, history, geography, mathematics, physics, natural sciences.

In order to facilitate the teachers' work and the pupils' studies, the National Teacher Training Institute set up a Documentation and Research Centre comprising 7 special commissions (technical studies on teaching and education; linguistic and phonetic studies; literary and aesthetic studies; psycho-pedagogical studies; studies of history and

geography; mathematical and scientific studies; studies of culture and civilization).

The results obtained at this Centre are placed at the disposal of all Cambodian teachers. At present, the commission on literary and aesthetic studies is preparing a literary edition of the Khmer classical texts included in the curriculum.

Vocational and technical schools

Technical education, which was virtually non-existent in 1945, is still in the embryonic stage. In 1945 there was only one establishment, the Phnom-Penh Vocational Training School, and it provided training only for minor industrial posts. Since Cambodia obtained its independence, several schools have been established in order to provide the country with the staff required for its economic development. A Directorate of Vocational and Technical Education was set up in 1958 and attached to the Ministry of National Education. It has direct control over the following educational establishments:

National School of Arts and Crafts. This school, which was established in 1957, is responsible for training technicians for the various branches of public administration as well as for private enterprises. Later on, an engineering section will be organized.

An apprenticeship centre is also attached to this establishment; its task is to train skilled workers for a certain number of branches of industry and the handicrafts.

The school's training course is divided into two stages, lasting 4 and 3 years respectively. At the end of these studies, pupils receive the *Brevet d'enseignement industriel* (industrial diploma) and the *Baccalauréat technique* (technical leaving certificate).

The school recruits its pupils by competitive examination among persons under 18 years of age who have completed their primary education and possess the complete primary school certificate (*certificat d'études primaires complémentaires*).

An accessory competitive examination (*concours latéral*) is also held for the recruitment of pupils for the special class which prepares them for admission to the industrial section; it is reserved for former pupils of the fourth-year class of the modern section of the *collèges* and *lycées*. The school receives day-pupils and boarders. Specialized training is given in the following subjects: general engineering (fitting, machine-tools, forging); carpentry and cabinet-making; sheet-metal work; electricity; motor mechanics; radio (section due to be established in September 1959); technical drawing.

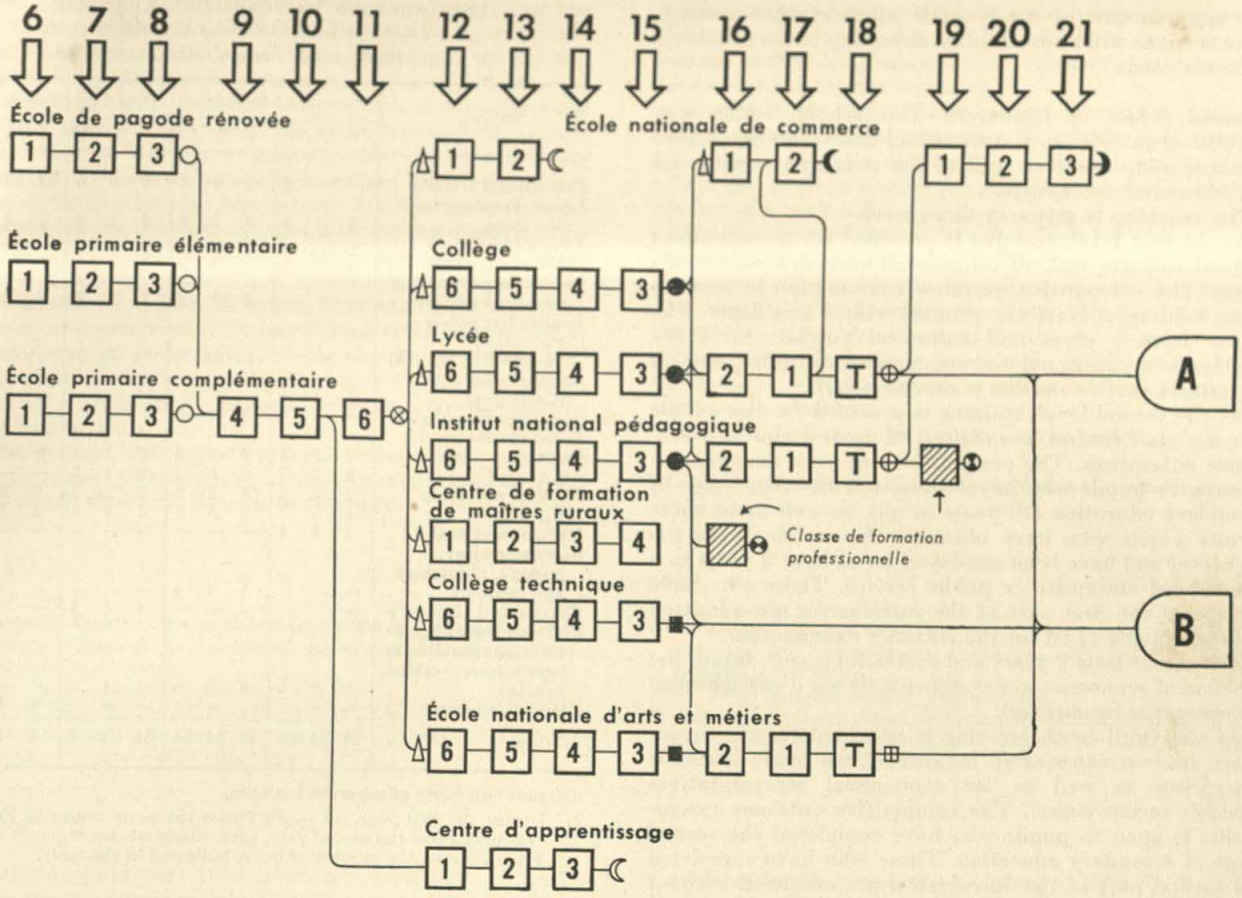
The school finds posts for its pupils, corresponding to their aptitudes and ability, as soon as they have completed their studies.

The course provided at the apprenticeship centre lasts, as a rule, 3 years and successful pupils obtain the certificate of vocational aptitude (*certificat d'aptitude professionnelle*).

Pupils are recruited by competitive examination from among those who have completed their fifth year of primary studies, irrespective of their age. The centre receives day-pupils and boarders.

At present, the centre has only two sections: cutting

GLOSSARY



classe de formation professionnelle: see *Institut national pédagogique.*
collège: lower general secondary school.
collège technique: lower vocational secondary school.
centre d'apprentissage: vocational training school.
centre de formation de maîtres ruraux: teacher training school for rural primary school teachers.
école de pagode renovée (modernized pagoda school): lower primary school attached to a pagoda and staffed by Buddhist monks.
Ecole nationale de commerce (National School of Commerce): vocational school of commerce with courses at lower secondary, upper secondary and post-secondary levels.
Ecole nationale d'arts et métiers (National School of Arts and Crafts: vocational secondary school of trades and industries.
école primaire élémentaire: lower primary school.
école primaire complémentaire: complete primary school.
Institut national pédagogique (National Teacher Training Institute): teacher training school with courses at two levels: (a) lower secondary studies plus a one-year course of professional training (*classe de formation professionnelle*) for primary school teachers; (b) complete secondary studies plus professional training (*classe de formation professionnelle*) for secondary school teachers. The Institute also trains inspectors.
lycée: general secondary school.

HIGHER EDUCATION

A. (i) Law Faculty, Royal School of Medicine. Royal School of Administration.
(ii) Institutions outside Cambodia.
B. Various schools and colleges run by the Ministries of Agriculture and of Public Works and Telecommunications for training technicians in their respective areas.

EXAMINATIONS

Baccalauréat de l'enseignement secondaire: baccalaureate (general education).
Baccalauréat technique: baccalaureate (technical education).
Brevet d'enseignement économique et commercial: secondary commercial diploma.
Brevet d'enseignement industriel: secondary technical diploma.
Certificat d'études primaires complémentaires: upper primary certificate.
Certificat d'études primaires élémentaires: lower primary certificate.
Certificat d'aptitude professionnelle: certificate of aptitude for a particular occupation in industry or commerce.
Concours d'admission: competitive entrance examination.
Diplôme de fin d'études de formation des instituteurs: primary teacher training diploma.
Diplôme d'enseignement supérieur commercial: higher commercial diploma.
Diplôme de professorat secondaire du premier cycle: lower secondary school teacher's diploma.
Diplôme d'études secondaire du premier cycle: lower secondary diploma.

and manufacture of ready-made clothes; shoe-making. Other sections will be established according to the country's economic needs.

National School of Commerce. This school, which was established in 1958, is a state school and trains the future directors and executive staff of the country's commercial and industrial enterprises.

The teaching is given at three levels:

At the first level, training is provided for the executive and subordinate staff of commercial and economic enterprises. The competitive entrance examination is open to those holding at least the primary school certificate. The course lasts 2 years and successful pupils receive the certificate of vocational and commercial aptitude (*certificat d'aptitudes professionnelles et commerciales*).

At the second level, training is provided for the middle ranking staff (*cadres secondaires*) of commercial and economic enterprises. The competitive entrance examination is open to pupils who have completed the first stage of secondary education (10 years in all), as well as to those former pupils who have obtained the certificate at the first level and have been employed for at least 2 years in a commercial enterprise or public service. Those who have completed the first part of the *baccalauréat* are admitted without having to sit for the entrance examination.

The course lasts 2 years and successful pupils obtain the diploma of economics and commerce (*brevet d'enseignement économique et commercial*).

At the third level, training is provided for the senior posts (*cadres supérieurs*) in commercial and economic enterprises as well as for commercial representatives (*attachés commerciaux*). The competitive entrance examination is open to pupils who have completed the second stage of secondary education. Those who have completed the second part of the *baccalauréat* are admitted without preliminaries. Those who have obtained the certificate at the second level and received an average of 14 marks at the final examination, as well as those who have completed the first part of the *baccalauréat*, are also admitted without having to sit for the entrance examination. Holders of the second level certificate who failed to obtain an average of 14 marks at the leaving examination and failed to pass the first part of the *baccalauréat* may also sit for the competitive examination.

The course lasts 3 years and successful pupils receive the higher commercial diploma (*diplôme d'enseignement supérieur commercial*).

School for the Training of Assistant Chemical Research Workers. This school, which was established in 1958, trains technicians for the various public and private services in Cambodia.

Pupils are recruited by competitive examination among those who have completed the first stage of secondary education. The course lasts 2 years, and successful pupils receive the manipulator's certificate at the end of the first year and the assistant chemical research worker's certificate at the end of the second year.

Kompong-Cham Technical College. This establishment, which is to be set up in September 1959, will train specialized workers for various branches of industry. It will recruit its pupils by competitive examination among those who have completed their 6 years of primary education and hold the primary school certificate (*certificat d'études primaires*).

The course will last 4 years and successful pupils will receive the industrial diploma. Specialized training will be given in the following subjects: general engineering; carpentry and cabinet-making; sheet-metal work; electricity; motor mechanics; radio; technical drawing.

Training may be given in other subjects according to the country's needs.

a = plus two hours of supervised studies.

1. During the first year, all pupils follow the same course in French (5 hours). From the second year, particularly advanced pupils study French during the number of hours indicated in the table.

Other establishments. Two agricultural schools (primary and secondary) have been established by the Ministry of Agriculture.

The Ministry of Public Works and Telecommunications trains its technicians at two vocational training schools: the School for Assistant Engineers and the School for Railway Apprentices.

Teacher training schools

The aim of the professional teacher training course is to train complete primary school teachers and is reserved for

teacher training school students who have completed the fourth-year class and persons holding the lower secondary school certificate (*diplôme d'études secondaires du premier cycle* or *brevet d'études du premier cycle*).

According to the number of vacancies, this professional training course is also open to former pupils of the fourth-year class of secondary schools, the candidates being recruited by competitive examination. The course lasts 1 year. Successful students receive the teacher's diploma (*diplôme de fin d'études de formation des instituteurs*). The weekly time-table for this course is as follows: Khmer, 2 hours; Khmer culture and civilization, 1; French, 4; mathematics, 2; natural sciences, physics and chemistry, 2; history and geography, 2; moral and civic instruction,1; psychology, 4; pedagogy, 3; school administration and legislation, 1; hygiene and *savoir-vivre* (home economics, for girls), 1; drawing, 1; physical education, 1; solfeggio, 1; total hours, 26.

The general training of student-teachers aims at giving them a thorough knowledge of the primary school curriculum, which they will later have to apply.

This training is completed by practice teaching, which, from the second term on, takes the form of demonstration lessons (*stages*) in primary school classes; there are three demonstration lessons per week.

At the beginning of each *stage*, the student-teacher simply attends lessons given by an experienced teacher; this passive period is followed by an active period, during which the student teacher himself gives lessons under the control of a *maître de stage*.

The Kompong-Kuantot Teacher Training Centre trains new teachers for rural schools. The course lasts 4 years. A competitive entrance examination is organized each year. It comprises, in addition to other tests, dictation, an essay, the solving of problems and an intelligence test.

The teaching staff is composed almost entirely of Cambodians, with the exception of 2 or 3 American experts, who act as advisers.

The weekly time-table is shown in the table on page 310.

STATISTICS

Population (mid-year 1958 estimate): 4,740,000.
Area: 66,607 square miles; 172,511 square kilometres.
Population density: 71 per square mile; 27 per square kilometre.

Summary of school statistics, 1953–57. Total enrolment in all educational institutions from primary to university level was about 495,500 in 1957/58, representing approximately 11 per cent of the estimated population. Of the school-going population, 97 per cent were enrolled in primary schools and private secondary schools, about 2.3 per cent in public general secondary schools, 0.2 per cent in technical schools and 0.5 per cent in teacher training schools and university colleges. There were, in addition, 2,521 persons enrolled in adult literacy courses. Girls made up nearly 25 per cent of the enrolment in primary schools (16 per cent in 1953/54), 14 per cent in public secondary schools, and 7 per cent in teacher training schools. Data available on the numbers of teachers are very incomplete. The average pupil-teacher ratio in public elementary and complementary schools was about 51, in pagoda schools 37, in public *lycées* and *collèges*, 35 (44 in 1953/54). It is not possible to compare progress made in teacher training schools over the period under review due to lack of separate data. Compared with 1953/54, enrolment in all primary and private secondary schools had increased by about 76 per cent. (See Table 3.)

Enrolment trends in secondary education, 1930–57. Between 1930 and 1950 the average number of pupils in public general and vocational secondary schools doubled. However,

1. EDUCATIONAL FINANCE, 1958 (in riels)[1]

A. EXPENDITURE BY PURPOSE

	Amount
Total expenditure[2]	**606 309 210**
Recurring expenditure	538 682 110
Capital expenditure	67 627 100

B. RECURRING EXPENDITURE BY LEVEL AND TYPE OF EDUCATION

	Amount	Per cent
Total recurring expenditure	**538 682 110**	**100.0**
Primary education	465 920 430	86.5
Secondary education[3]	72 761 680	13.5

1. Official exchange rate: 1 riel = 0.029 U.S. dollar.
2. Budget estimate.
3. Of which 8,339,660 riels (1.5 per cent) for vocational education.

in relation to the school age population between 15 and 19 years old the secondary enrolment ratio, excluding private schools, moved only from 0.2 to 0.3 in 20 years. Since 1953, public secondary education has made rapid strides. The average enrolment in public secondary general, teacher training and vocational schools increased from 4,309 in the years 1953–54 to 10,151 in the years 1955–57. Although the enrolment ratio more than doubled in 5 years it still stood at only 2.4 in relation to the age group 15–19 years at the end of the period under review. (See Table 2.)

Examination results in secondary education. Forty-seven students passed the first part and 20 students the second part of the *baccalauréat* in 1957–58. There were also 375 successful candidates for the diploma granted by *lycées* and *collèges* at the end of the lower stage of secondary education. Eighty-two teacher diplomas were awarded in 1957/58 and 51 students obtained technical or art diplomas in vocational education. No data are available for earlier years.

Educational finance, 1958. Total public expenditure on education in 1958 was estimated at 606,309,210 riels, representing about 128 riels per inhabitant. Of this total, about 11 per cent was for capital expenditure. (See Table 1.)

1. Including data on private secondary education.
2. Public schools only.
3. Not including data on private and foreign schools.
4. Public schools only, including secondary teacher training.
5. Including 25 training schools for monks teaching in pagoda schools.
6. Included in secondary general education.
7. Not including the National School of Agriculture, which enrolled 103 students in 1956/57.
8. Not including the Royal School of Medicine.

CAMEROUN

The former Trust Territory under French Administration became the Republic of Cameroun on 1 January 1960.

Educational policy is decided by the Ministry of National Education, the functions of which were fixed by a decree dated 16 April 1957. Within the Ministry the Directorate of Education comprises sections for primary, secondary and technical education and for youth and sports. The Minister is advised by a Higher Council on Education (Conseil Supérieur de l'Enseignement); this meets at least once a year to discuss questions submitted by the Minister. For purposes of school inspection the country is divided into six regions.

The main objectives of recent policy have been to raise standards by improving the training of teachers, to increase the number of girls enrolled at school, and to close the wide gap in educational development between the north and the south of the country.

Schools are maintained by the Government and by private agencies. Private schools are granted financial aid when an official act of recognition has been passed by the Government, but even unaided schools can be opened only if they are registered with the Ministry. All private schools adopt the same curriculum as public schools.

National education is financed from the country's budget and, representing 14 per cent of the total budget in 1960, is one of the most important elements of public expenditure. Assistance is provided also by the French Government from a fund for aid and co-operation; this covers the salaries of French teachers and a grant for school buildings.

The structure of the school system is derived from the French and the French language is used as medium of instruction. The curriculum and some of the types of school have been modified to suit Cameroun conditions.

Public secondary schools of the academic type are identical with the *lycées* and *collèges* in France, and there are also a number of private schools of similar status. The shorter secondary course is given in *cours complémentaires*, public and private, some of which have a technical bias. In the area of technical and vocational education at secondary level, there is one *collège technique* and a number of apprenticeship centres, preparing students for vocational certificates. Homecraft sections (*sections et cours ménagers*) form another category, and offer courses of between 2 and 5 years. The largest single group of vocational schools are those preparing primary teachers: these are normal schools or courses (in part post-secondary) or else teacher training centres with a course parallel to the first cycle of secondary schooling.

[*Text prepared from official sources by Unesco Secretariat in April 1960.*]

STATISTICS

Population (mid-year 1958 estimate): 3,187,000.
Area: 166,796 square miles; 432,000 square kilometres.
Population density: 19 per square mile; 7 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, there were 308,500 pupils enrolled in all types of education (not including adult education courses). This number represented about 10 per cent of the total population. Of these pupils 95 per cent were enrolled in primary schools, the majority being in private schools. The proportion of girls was 29 per cent in the primary schools, and the average number of pupils per teacher was 50. Between 1953 and 1957, primary school enrolment increased by 70 per cent. (See Table 3.)

Enrolment trends in secondary education, 1947–57. Table 4 shows steady increase of pupil enrolment in all three types of secondary education. The average total enrolment for the period 1955–57 is estimated at about 7 times that for the period 1947–49. Nevertheless the total enrolment for the most recent period is less than 3 per cent of the estimated population 15–19 years old.

Examination results in secondary education, 1953–57. The number of lower secondary school certificates fluctuated between 1953 and 1957, reaching a high point in 1954 and a low point in 1955, and being 16 per cent more in 1957 than in 1953. There was a general increase in the number of other certificates and diplomas granted, and particularly as regards certificates of vocational training, which numbered 159 in 1957 as compared with none in 1953 and 6 in 1954. (See Table 1.)

Educational finance, 1958. For the fiscal year beginning in January 1958, the education budget amounted to 1,422

million C.F.A. francs, not including 304 million francs from the French Government's Investment Fund for Economic and Social Development (FIDES) allocated for 1957/58. The average educational expenditure per inhabitant was therefore about 450 francs without the FIDES allocation (or about 540 francs including FIDES). The distribution of expenditure by level and type of education is shown in Table 2C.

CANADA

THE EDUCATIONAL SYSTEM

Canada is a federation composed of ten provinces and two sparsely populated territories north of the provinces. Responsibility for providing and maintaining schools is vested in the provincial legislatures for the provinces, and in the Federal Government for the territories. Both similarities and differences are to be found among provincial organizations for educational administration. The two that diverge most from the general pattern are Quebec and Newfoundland, the former having a dual system of Roman Catholic and non-Catholic schools, and Newfoundland a public denominational system in which four main and some other religious groups operate schools. Throughout the country there is a persistent movement towards providing all Canadians with greater opportunities for more education.

The Federal Government. The role of the Federal Government is relatively small: by the British North America Act of 1867, which united the Canadian provinces, the organization and administration of education was made a provincial responsibility. The federal authorities are, however, responsible for the education of Indians—who are wards of the Federal Government—whether within or outside provincial boundaries, of Eskimos and other people outside the provinces, of members of the armed forces and their dependents, whether within or outside Canada, and of inmates of penitentiaries. Educational and vocational training programmes in the territories are run by the Education Division, Indians Affairs Branch, Department of Citizenship and Immigration, operating under the Northwest Territories Act, Chapter 331 of the Revised Statutes of Canada, 1952. The Department of National Defence is empowered by the National Defence Act, Chapter 164 of the Revised Statutes of Canada, 1952, to enter into an agreement with the provinces to provide schools or give financial support to public schools and to establish and administer schools abroad for the dependents of members of the armed forces.

In addition, the Federal Government provides: (a) matching grants for the development of vocational education, including construction of buildings, purchase of equipment and payment of teachers' salaries; (b) grants to universities and colleges, distributed by the National Conference of Canadian Universities on a *per capita* basis by province and student enrolment per institution; and (c) grants toward scholarships and research, distributed by the Canada Council, the National Research Council, the Defence Research Board and several departments of government.

The Provincial Governments. The organization and administration of each provincial educational system and the operation of all publicly controlled schools in the

system has its basis in the provincial School Act or Acts. The most common practice is to enact one School Law covering both elementary and secondary schools, under which local elected boards administer the schools of the district. But in Ontario, for example, one may find separate elementary and secondary school boards, one elected, the other appointed, operating in the same city but under separate School Laws.

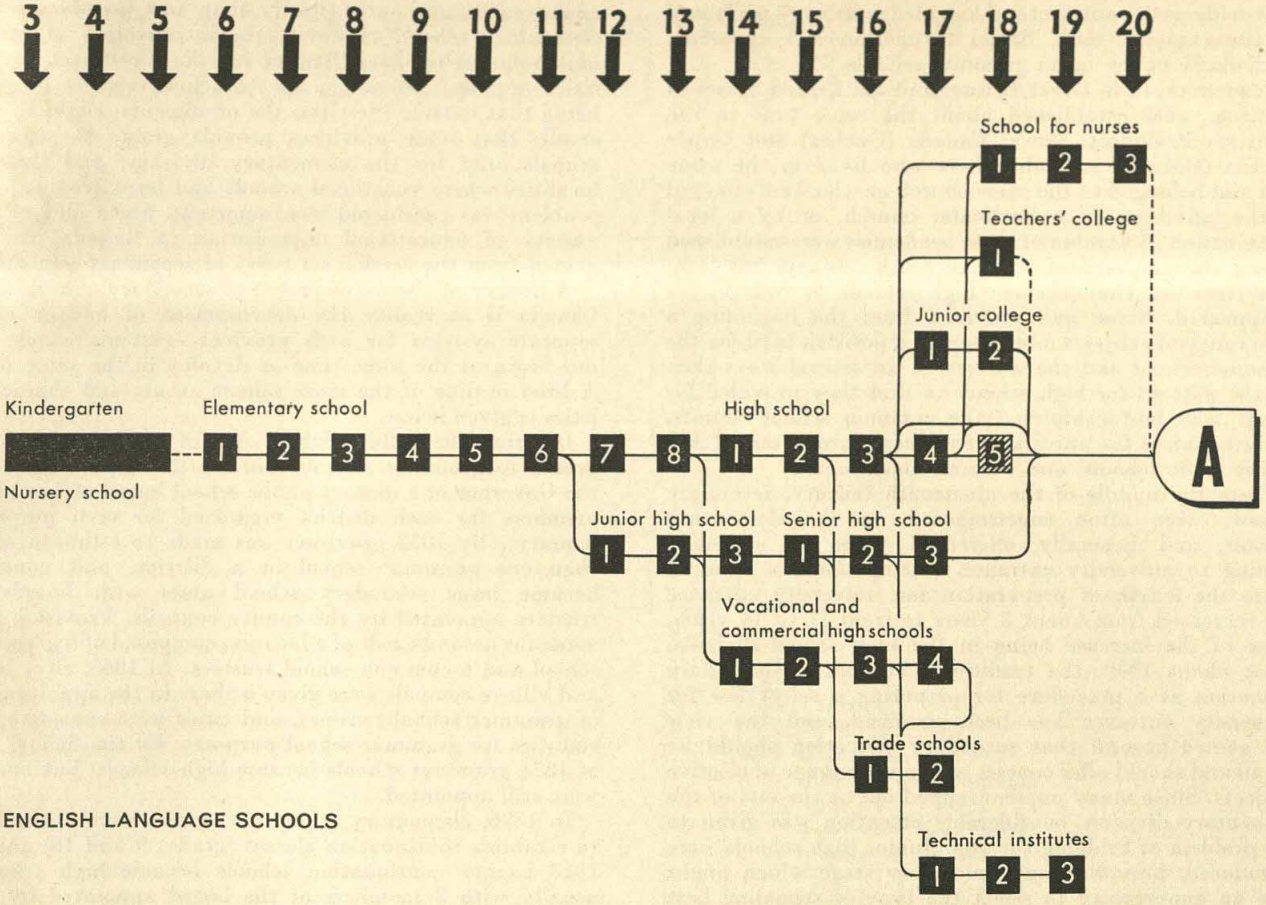
Each provincial government has a Department of Education which is responsible for formal education within the province but which may share responsibility for vocational and adult education with one or more other government departments. Each Department is headed by a Minister of Education except in Quebec, where the Provincial Secretary deals with educational administration and grants, while the Catholic and Protestant Committees of the Council of Public Instruction are responsible for pedagogical matters. The Minister is a member of the Cabinet. Under him is a Deputy Minister or Chief Director of Education, a civil servant, who administers the Department composed of directors and staff responsible for administration and grants, curriculum and textbook services, teacher recruitment and training, supervision and inspection, special services, examinations, registrations, etc.

The School Act or Acts and regulations largely determine the duties and responsibilities of the Department and the establishment and conduct of the schools. A typical Department, among other tasks, draws up programmes of studies; authorizes textbooks and provides lists of approved supplementary readers and library books; issues regulations concerning teachers; regulates the selection and training of teachers, and issues certificates to them; approves the erection of buildings; supervises the operation of the schools; and provides grants to local boards, usually in accordance with a formula which takes account of enrolment, attendance, staff members and need.

Local government authorities may be city school boards, municipal boards, boards of larger units, or rural school district boards operating independently or under the board of a larger unit. The boards are composed of local citizens either elected from among the ratepayers or appointed—usually by the Department or local municipal council. Official trustees have been appointed to act in lieu of a board in some outlying areas and in a few districts where for some reason a board could not be elected.

Under the School Act and regulations a local school board is responsible for the construction, maintenance and operation of such schools as are required for all children of school age. It purchases sites, erects buildings, furnishes and maintains them, employs teachers, and ensures that the school or schools are operated according to regulations.

While most schools are non-denominational, several of the provinces have provisions in the School Law concerning the place of religion in the schools or providing for the establishment of separate schools by religious minorities. Others provide for religious differences through denominational schools. Newfoundland has four superintendents of education representing the four main denominations; these officials come directly under the Deputy Minister and are responsible for the schools of their respective denominations. In Quebec the Roman Catholic French-speaking majority operate one school system; the non-Catholic minority operate a second system with equal privileges before the law. In Ontario, Saskatchewan and Alberta the first school to be established in a school section must be a public school; thereafter a second school, known as a 'separate school', may be established by a Protestant or Catholic minority. In the public schools of other provinces the degree of denominationalism to be found varies according to the School Law, the regulations, or the disposition of the population of the district.



Private agencies. The School Law in most provinces provides that children of school age do not have to attend public school so long as they are receiving efficient instruction elsewhere. A variety of private schools have been established in all provinces, some under church auspices, some under private auspices. A number of these schools provide special services, e.g., testing out new methods and devices, providing education for atypical children etc. Outside Quebec, where perhaps 10 per cent of the school children are enrolled in private schools, there are only about 3 per cent of primary and secondary pupils in private institutions—some 350 schools, more than half of them Roman Catholic. Of the 350, just under half are residential, 120 provide secondary and 122 both primary and secondary instruction. About 47 per cent of the pupils are enrolled in high school grades.

There are also many private schools providing vocational courses at secondary and post-secondary level, either by daytime or evening attendance, or through correspondence courses.

The structure of the school system

Canadian education is commonly referred to as a ladder with steps from kindergarten through elementary, secondary and higher education divisions. Each division leads to the one above. In a limited number of districts in certain provinces the secondary division is further divided into junior and senior. Entrance to secondary schools is made after the successful completion of grade 8 in most provinces, except in those localities where there are junior high schools which admit pupils who have completed grade 6, and after 7 years' primary schooling in Quebec. Considerable attention has been given to making the transition smooth, and in most provinces the only requirement for entrance to secondary schools is promotion from the elementary division. For most pupils the end of elementary education is not a parting of the ways, although to a certain extent there may be some selection; and a limited number who wish, or who are not academically inclined, enter vocational education or leave school.

To provide for students going on to higher education, most secondary schools offer a college-preparatory course, and in a majority of the provinces the final high school year overlaps first year university, so that students who complete this final year enter second-year university. The secondary schools of several provinces also offer terminal courses, which are general courses with many electives, or the various courses found in composite schools. Most of the larger cities have separate schools for technical and commercial education.

GLOSSARY

elementary school: primary school.
high school: secondary school with 4- or 5-year courses of academic, commercial, technical or composite type. The larger high schools may be known as *collegiates.*
junior college: non-degree granting college; some junior colleges combine the upper years of high school and first years of undergraduate study; others have a high school department affiliated to a university.
junior high school: lower general secondary school comprising the two upper grades of the regular *elementary school* and the first grade of *high school.*
kindergarten: pre-primary school for 4- and 5-year-olds.
nursery school: pre-primary school for 3- to 5-year-olds.
school for nurses: vocational training school.
senior high school: upper secondary school.
teachers' college: teacher training college, sometimes known as *normal school.*
technical institutes: vocational training schools with advanced, or post-secondary courses training technicians and technologists.
trade schools: vocational training schools.
vocational and commercial high schools: secondary schools with 4-year courses emphasizing vocational subjects.

A. Institutions of higher education.

Two diagrams (pages 319 and 321) illustrate the main types of educational organization found in the Canadian provinces.

The two official languages in Canada are English and French. In any provincial system where one of these is the principal language of instruction, the other may be taught as a second language. However, the pupil's incentive to learn the second language varies according to such factors as the course of study taken, geographical situation, cultural milieu and probable economic rewards. In some schools other modern languages such as German, Ukrainian or Spanish may be taught as a second or third language, or in some cases used for instruction at school according to regulations.

THE DEVELOPMENT OF SECONDARY EDUCATION

General education. Secondary schools were first established in Canada to prepare students for the professions. For the most part, secondary education was intended for those going on to university, while common schools were intended

to provide such rudiments of knowledge as were necessary for the common man. Social distinction was apparent, particularly in the Latin grammar schools.

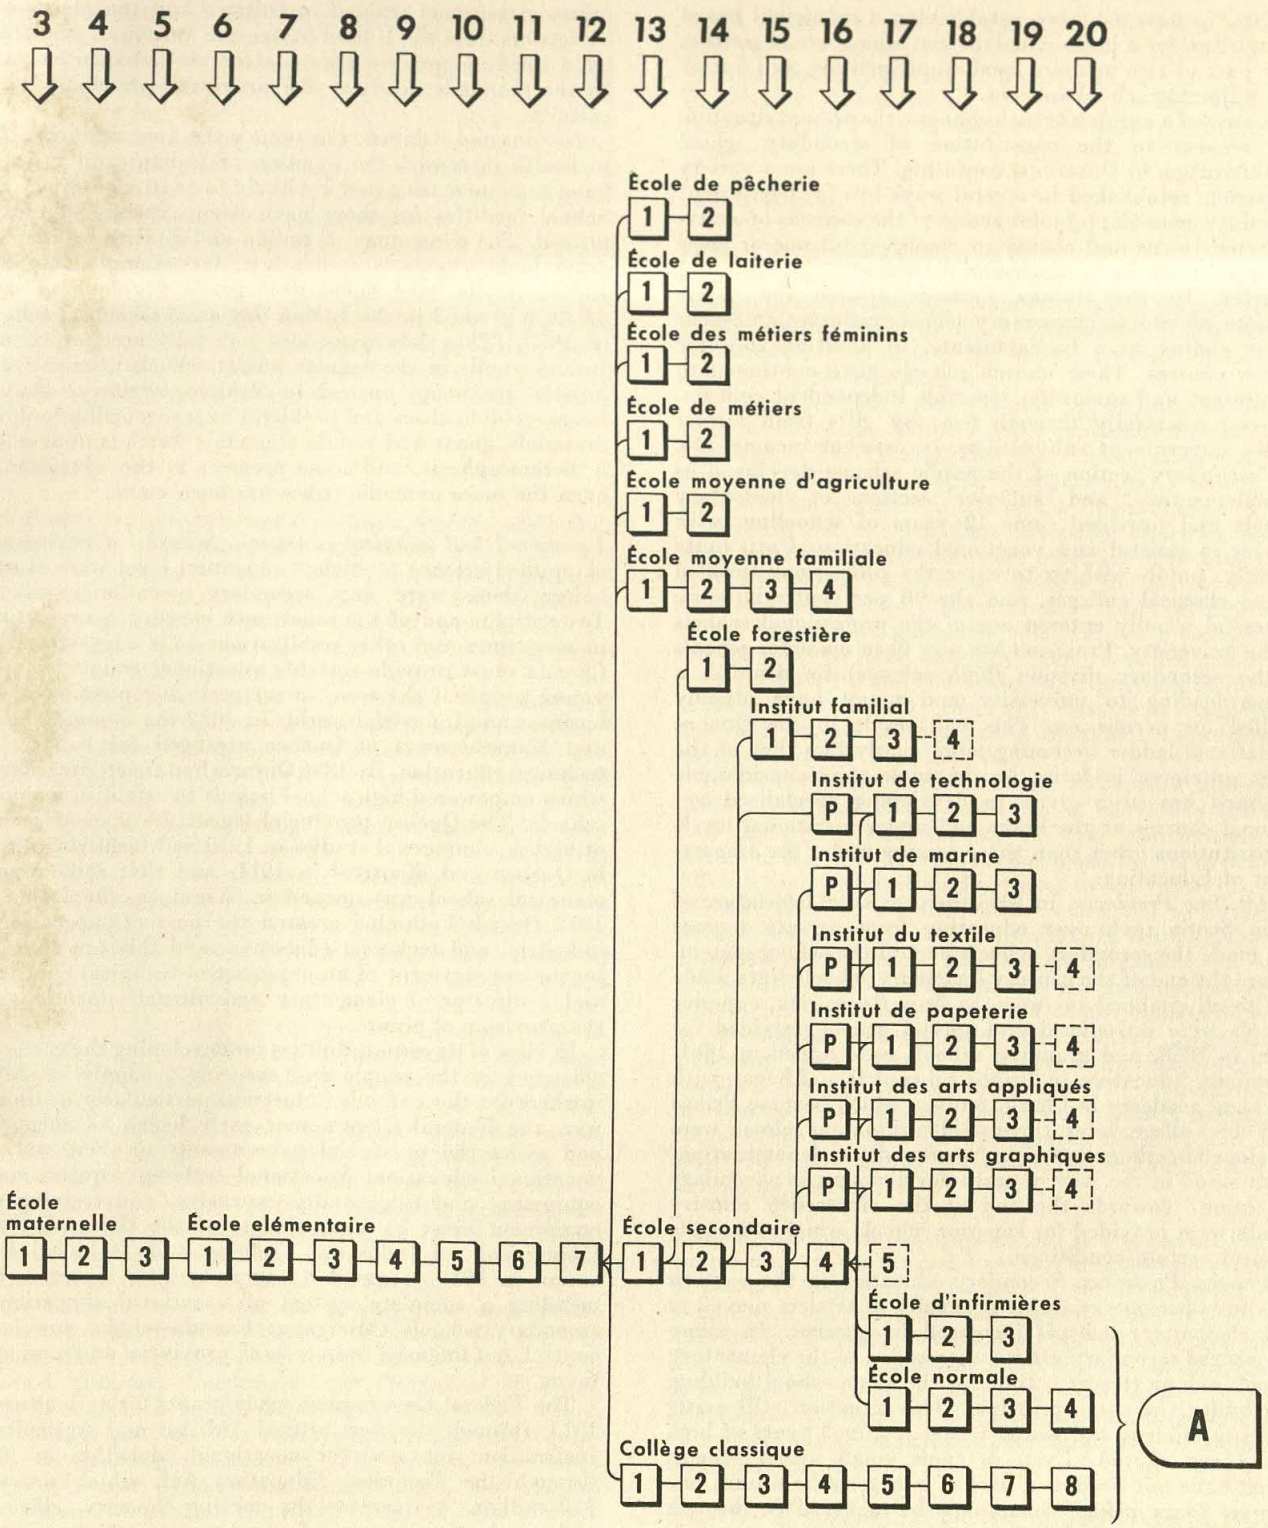
Academies, as in Great Britain and the United States of America, were established about the same time in the Maritime Provinces, Lower Canada (Quebec) and Upper Canada (Ontario) by subscribers who lived in the same area and belonged to the same church or who were opposed to the privileges of a particular church, or by a local organization. A number of these academies were established during the first half of the nineteenth century, but from that time on, they became high schools or colleges, or disappeared. Some had provided from the beginning a wide range of subjects and occupied a position between the common school and the university. In several ways they set the pattern for high schools in that they provided for pupils who had completed the common school courses, offered courses for university entrance, normal school and higher trade schools, and were co-educational.

From the middle of the nineteenth century, secondary schools were often superimposed on the elementary schools, and generally offered 3 years of schooling leading to university entrance. During the last hundred years the length of preparation for university entrance has increased from about 8 years to from 11 to 14 years, most of the increase being in the high school division. Since about 1900, the traditional concept of secondary education as a procedure for preparing a select few for university entrance has been modified, and the view has gained ground that secondary education should be for all and should offer courses with a wide range of elective subjects. Since many pupils dropped out at the end of the elementary division, considerable attention was given to the problem of bridging the gap. Junior high schools were introduced, providing an exploratory stage which might give an opportunity to select the type of schooling best fitted for the pupil, to prepare him adequately for senior high school, and to adapt the teaching to that phase of adolescence more satisfactorily than was possible in the elementary school. However, the introduction of junior high schools has been limited for the most part to the cities of some provinces, the principal reasons for this being that outside the cities the enrolments would be too small; that some provinces provide grants to separate schools only for the elementary division; and that in localities where vocational schools had been provided the problem was considered less important. Some idea of the variety of educational organization in Canada can be gained from the section on types of secondary education.

A history of the development of secondary education in Canada is in reality the development of one or more separate systems for each province—systems which did not begin at the same time or develop in the same way. A brief outline of the more salient events and characteristics is given below.

Ontario. The Public School Act of 1807 provided for grants to grammar schools and for the appointment by the Governor of a district public school board of 5 or more members for each district organized for civil purposes (county). By 1853 provision was made to establish more than one grammar school in a district, and counties became basic secondary school units with boards of trustees appointed by the county councils. Provision was made for union boards of education composed of 8 grammar school and 6 common school trustees. In 1865, city, town and village councils were given a share in the appointment of grammar school trustees, and cities were considered as counties for grammar school purposes. By the School Act of 1871 grammar schools became high schools, but boards were still appointed.

In 1896, elementary school authorities were authorized to establish continuation classes (grades 9 and 10) and in 1913 county continuation schools became high schools, usually with 3 members of the board appointed by the county council. In 1946, county councils were empowered, with the approval of the Minister and the municipal



GLOSSARY

NOTE. Separate institutions for boys and girls.

collège classique: secondary school with classical academic course.
école de laiterie: vocational training school for workers in dairying industry.
école de métiers: vocational training school for various trades.
école de pêcherie: vocational training schools for the fishing industry.
école des métiers féminins: vocational training school of women's trades.
école d'infirmières: vocational training school of nursing.
école élémentaire: primary school.
école forestière: vocational training school of forestry.
école maternelle: pre-primary school.
école moyenne d'agriculture: vocational school giving practical training in agriculture.
école moyenne familiale: vocational training school of home economics.
école normale: teacher training school.
école secondaire: general or composite secondary school, including schools previously known as *école primaire complémentaire*, and *école primaire supérieure.*
institut de marine: vocational training school of navigation and marine engineering.
institut de papeterie: vocational training school for workers in the papermaking industry, with courses at secondary and post-secondary level.
institut de technologie: vocational secondary school of technical studies, preparing for a wide variety of trades and industries.
institut des arts appliqués: vocational training school of arts and crafts.
institut des arts graphiques: vocational training school of printing, book manufacturing and related trades.
institut du textile: vocational training school for technicians in the textile industry.
institut familial: advanced vocational training school of home economics.

HIGHER EDUCATION

A. *Écoles supérieures et facultés universitaires:* colleges and university faculties.

FRENCH LANGUAGE SCHOOLS (Province of Quebec)

councils, to pass a by-law establishing a municipal board of education for a high school district which would contain all or part of two or more local municipalities, and one or more adjoining school sections.

Because of a number of such changes, the present situation with respect to the constitution of secondary school administration in Ontario is confusing. There are a variety of districts established in several ways by: (a) legislation; (b) county councils; (c) joint action of the councils of a city, separated towns and county or counties; (d) one or more municipal councils in unorganized territory.

Quebec. In the Roman Catholic system the *collège classique* offered to elementary school graduates an 8-year course ending in a baccalaureate, in addition to some shorter courses. These church schools have continued to the present and somewhat resemble independent colleges, financed essentially through fees, by gifts from former pupils, government subventions, investment income, etc. The secondary section of the public schools developed as 'complementary' and 'superior' sections of elementary schools and provided some 12 years of schooling, with courses in general and vocational education. Until quite recently, pupils wishing to enter the professions enrolled in the classical colleges, and the 30 per cent who were successful usually entered one of the professional schools at the university. Provision has now been made for schools in the secondary division (high schools) to establish a course leading to university and many have already applied for permission. This will result in the Quebec educational ladder becoming more nearly like that of the other provinces in form. At the same time considerable emphasis has been given to developing specialized vocational courses at the lower and upper vocational levels in institutions other than those coming under the Department of Education.

Maritime Provinces. In 1865 the provincial legislature of Nova Scotia took over education from private sources and made the secondary schools part of the school system. Before the end of the century secondary schools were made free to all qualified to enter. In New Brunswick, superior schools were introduced and special grants provided for them in 1858, and grammar schools were added in 1861. Secondary education in Prince Edward Island began with a central academy in Charlottetown, which became Prince of Wales College; later, three smaller grammar schools were developed in other centres. In Newfoundland denominationalism stood in the way of early development in secondary education. Towards the end of the nineteenth century grants were provided for superior schools which were able to meet certain conditions.

Western Provinces. Secondary education in the western provinces became available gradually as settlers moved in and elementary schools increased in number. In many schools the secondary grades were added to the elementary school, one or two at a time, in the same school building and under the same principal. This situation still exists in many villages and towns where 1, 2 or 3 years of high school are offered. Even in some small urban schools which have not become a part of a larger school unit, one or more years of high school may be taken, often through correspondence and with some assistance from the teacher. High school development was influenced greatly by an influx of teachers trained in Ontario and the Maritimes, by settlers from the United States and European countries, by a need to prepare students for the universities, and by the economic needs of the province—principally agriculture.

Indians and Eskimos. For some years now, mainly owing to health measures, the numbers of Indians and Eskimos have been increasing and are likely to continue to increase. School facilities for them have been expanded and improved. The percentage of Indian and Eskimo youth who enter high schools is rather low, for example only 251 Indian pupils were reported in grade 9 compared with 4,239 in grade 2 in the Indian day and residential schools in 1958. (This, however, does not take account of any Indian pupils in the regular public schools.) Schools and hostels are being opened in Eskimo territory. Despite language difficulties and problems of transporting building materials, goods and people, Canada's North is undergoing a metamorphosis, and some progress in the education of even the more nomadic tribes has been made.

Vocational and technical education. Schools of engineering or applied science at higher education level were started before there were any secondary vocational schools. Towards the end of the nineteenth century many articles in magazines and other publications were suggesting that Canada must provide suitable vocational training for her young people if she were to maintain her position in the business and industrial world. In 1882 the Council of Arts and Manufacturers of Quebec arranged for lectures on technical education. By 1896 Ontario had enacted legislation which empowered high school boards to establish technical schools. The Quebec provincial legislature opened schools of higher commercial studies in 1910 and technical schools in Quebec and Montreal in 1911, and that same year a technical school was opened in Winnipeg, Manitoba. In 1912 British Columbia created the post of supervisor of industrial and technical education, and this was followed by the appointment of an organizer of technical education and a director of elementary agricultural education and the provision of grants.

In view of its responsibilities for developing the economic efficiency of the people and ensuring a supply of skilled workers for the nation's industries, particularly in time of war, the Federal Government early began to encourage and assist the provincial governments in their work in vocational education. Vocational training requires costly equipment and is generally expensive, and training and equipment must be kept abreast of the times. A Royal Commission on Industrial Training and Technical Education in 1910 prepared a comprehensive report recommending a complete system of vocational education in secondary schools throughout Canada—under provincial control, but financed from federal, provincial and municipal funds.

The Federal Government made grants for agriculture in 1913, through the Agricultural Aid Act and Agricultural Instruction Act, and for vocational education in 1917, through the Technical Education Act, which provided $10 million 'to increase the earning capacity, efficiency and productive power of employees in industry and mechanical trades'. These were matching grants; the

provinces took the initiative in obtaining them and spending the money.

From 1919 to 1925 other provinces passed Vocational Education Acts, but by that time the impetus from World War I had died down. In 1925 a commercial course was offered in academic schools in Manitoba, a trend towards combining academic and vocational courses which has continued up to the present with composite schools being erected in both urban and rural areas.

During the past decade there has been considerable expansion in the fields of technical and vocational education. At present approximately 200 provincial and municipal institutions offer technical and trade training in Canada. Of these, some 20 to 25 institutions provide mainly post-high school, or advanced technical courses; about 100 provide high school industrial courses, and 75 or 80 have trade courses for apprentices.

Legal basis

All publicly supported secondary schools, whether academic, vocational or composite, are established under the appropriate School Law enacted by the provincial legislature or by the Federal Government in the few situations mentioned previously. As was pointed out above, the provincial School Law usually covers both the elementary and secondary divisions, but in Ontario there is a separate law for each division and in Saskatchewan collegiates and vocational high schools may be established under Secondary School Regulations and high schools under the School Law.

Participation by the Federal Government in vocational education is for the most part carried on through the Canadian Vocational Training Branch of the Department of Labour. The legislative authority for all commitments of this Branch is the Vocational Training Co-ordination Act of 1942, which provides for co-operative action between federal and provincial governments in this field. The Act authorizes the Minister of Labour to undertake vocational training projects to fit persons for vital industries and defence, the conservation and development of natural resources or any work in the national interest, and to assist the unemployed. To this end the Minister may enter into agreement with the provinces to operate such projects and to share the cost on a 50–50 basis for any of the following: continuation of projects already operating under the Youth Training Act; projects recommended by the Vocational Training Advisory Council to provide vocational training for apprentices and supervisors; the development and carrying on of vocational training on a level equivalent to the secondary school level; projects for rehabilitation and technical training in primary industries.

The Federal Government has provided for appropriate provincial authorities to organize and operate the training projects and encourages programmes deemed to be in the national interest. Vocational and Technical Training Agreement No. 2 is the basic agreement under which assistance is provided for facilities, buildings and equipment for training programmes. The present agreement covers a 5-year period from 1 April 1957. The capital appropriation is allotted to provinces on the basis of their population aged 15 to 19; the rest is allotted for operating costs of approved programmes in institutes of technology, trade institutes and vocational departments of high schools. A Vocational Correspondence Agreement, April 1950 to March 1955, has been extended, a year at a time, to provide assistance in revising approved vocational correspondence courses which are available to all Canadian residents.

Administration

Most of the provinces have an advisory council which meets once or twice a year to consider matters of policy in education and advise the Minister. Typical representatives are members of the Department of Education, the university, the teachers' federation, the school trustees' association and other interested bodies.

Changes in policy are effected by legislation, usually introduced by the Minister after consultation with other members of the Cabinet and after consultation with the Deputy Minister and other Departmental officials. Implementation of policy is left to the Department.

The director of curriculum normally organizes one or more committees and conducts meetings throughout the province before introducing changes in the curriculum, usually on a trial basis. Since the universities are interested in the high school graduates who will enter college, university officials have normally been consulted about the courses of study, and the setting of examinations for high school seniors. In some cases they may permit collegiates and high schools to recommend their better students for entrance without examinations.

In recent years there has been widespread interest in problems related to the selection of university students and the equity and validity of final examinations for selection. Research surveys are being conducted in Ontario, Alberta and the Maritime Provinces to determine just how effective present selection methods are and to advise on changes which should be implemented. In British Columbia emphasis has been on trying out new methods.

Vocational advisory committees are used extensively at federal, provincial and local levels of government to assist in developing and operating the various programmes. Generally they consist of government, employer and employee representatives, sometimes with representatives of other interested groups. They meet regularly to consider types of courses needed and course content, and may assist in maintaining standards, sometimes acting as examining boards.

Control. The provincial Department is responsible for the enforcement of the School Law and Regulations pursuant to the law, and certain members of the Department such as directors and inspectors are appointed to carry out this task and ensure that the schools are operating as prescribed. The Department maintains some degree of uniformity in the secondary schools through prescribing the curricula, selecting lists of books or prescribing texts, the certification of teachers and through the appointment of superintendents to inspect the schools.

Supervision and inspection. Most of the provincial Departments of Education, in selecting their inspectorial staff, provide for a limited number of superintendents or in-

spectors whose work is at the secondary level exclusively. Secondary inspectors may have their office at the provincial capital, from which they travel to inspect the secondary schools, in which case they are usually responsible for a particular area and work with the district superintendents in inspecting a school, or they may be allocated to a section of the province. Inspectors in the other provinces inspect both elementary and secondary schools; they are usually allocated to an area, or are employed by a city board.

Requirements for appointment vary, but the selection is usually made by a civil service commission from candidates who possess an advanced degree in education, have included in their studies a course for administrators, and have had several years of successful experience in teaching, according to inspectors' reports, etc.

The supervisory staff are responsible for direction of the public school service and the maintenance of satisfactory standards of instruction in the classrooms. They promote co-operative and group supervision among the principals and teachers, assist with conventions and institutes, and otherwise provide leadership, and in many cases participate in an increasing number of surveys into building needs, administrative reorganization and instructional programme improvement.

The CEA-Kellogg Project in Educational Leadership 1952–56, the aim of which was to clarify the role of the superintendent, work out practical solutions encountered in individual superintendence and bring together a fund of knowledge and materials on school supervision and administration in Canada, has focused attention on this area with good results as shown from improved communication between administrators, a change to participative direction, and an appreciation of the position of supervisors and the need for courses in supervision.

Finance. Secondary schools are supported from revenue from local tax receipts, grants from the provincial government, and in a few cases from fees. In addition, grants for vocational secondary schools, including vocational departments of high schools (instruction, buildings and equipment) are made from federal funds. The bases on which provincial operating grants are paid vary from province to province, but generally take into account the number of teachers, and possibly their certificates, the number of pupils, the number of days the school was open and the relative ability of the district to support its schools. Building grants are often on a shared basis for approved construction.

TYPES OF SECONDARY EDUCATION

Some idea of the variety of secondary schools in Canada can be obtained from the following summary of types of secondary school organization by province.

Beginning with the Western Provinces, there are in British Columbia high schools, junior and senior high schools separately, junior-senior high schools, and superior schools taking courses up to grade 10. The latter are usually attached to elementary schools, the other types of secondary school may or may not have an elementary division. In Alberta junior high and senior high divisions are common but may be found in the same school. Saskatchewan has high schools and collegiate institutes but the principal difference between the larger high schools and smaller collegiates is one of name and of the Act under which they operate. Technical collegiates are found in the cities. In the villages and small towns the high school is often an integral part of the all-grade school but may offer only some years of high school. Secondary education in Manitoba is similar except that in the city of Winnipeg there are also a number of junior high and senior high schools.

In Ontario there are academic, technical and commercial collegiates and composite high schools in the cities, and outside the cities, town, village and county high schools, most of which are academic. Quebec has a greater variety of secondary schools, or divisions of high schools, than most provinces. There are the *collèges classiques* for boys and girls, of which the first 4 years are secondary. There are high schools for boys which provide a choice of commercial, scientific, general, industrial or agricultural sections, with an academic college preparatory course now being added. There are also trade schools. Girls may enter academic, general, commercial or general sections in the high schools; the general section leads to teacher training in normal schools, nursing or home economics.

As regards the Maritime Provinces, New Brunswick has high schools, vocational schools, rural and urban composite schools, the rural composite schools generally being for pupils of grade 7 and up throughout the counties in which these schools are situated. Nova Scotia recognizes junior and senior high school divisions, including rural regional high schools. In Prince Edward Island there are secondary divisions in the schools of the larger centres and some secondary education is offered in the colleges. In Newfoundland high school instruction is given in many one-room schools as well as in the larger centres. At present a considerable number of regional schools are being organized. Radio programmes are used to supplement correspondence courses for secondary pupils in remote rural areas.

Between 60 and 70 per cent of all children who are enrolled in grade 1 of elementary school later enter high school, but a much smaller percentage complete a secondary course. In the cities the pupils may enter academic, technical or commercial secondary schools or courses, or may cut across these lines where there are composite schools. In small towns and villages the pupils normally have to take the academic course and in the smaller schools there are usually few options.

Pupils completing the elementary division in rural schools may be fortunate enough to live in a district where there is a central rural high school or where transportation is provided to a centralized high school in a town or village. Otherwise they must either go away to high school or depend exclusively on correspondence courses, getting what help they can from the local elementary teacher. In those provinces where larger units are organized there is usually provision for central high schools, and in at least two provinces more attention is being given to organizing larger units for secondary schools than for education at primary level. Usually this requires the erection of a central school building with buses to transport the pupils, but in a

few places where transportation is difficult dormitories have been provided. Many of these schools are of the composite type. Their increasing numbers represent a strong trend.

The view is often taken that there should be a minimum of from 300 to 500 pupils in such schools so that courses may be offered in the academic, commercial and technical fields and possibly home economics, agriculture, etc., and so that the classes will not be too small for efficient school management. New Brunswick regulations recommend that rural high schools be located wherever there are sufficient pupils, so long as the area is of suitable size and amply provided with roads. The plant should contain at least four academic classrooms, facilities for manual subjects and domestic science, an auditorium-gymnasium, laboratories, a library, facilities for hot lunches, adequate space for sports, garden and a demonstration plot; hostels for boarders and a teacherage where necessary. It should also be a community centre.

General secondary schools

Educational requirements for entry have been mentioned in the section on the structure of the school system. In some schools the entrants are divided into three streams on the basis of one or more of the following: public school examinations, intelligence tests, standardized achievement tests, and teachers' ratings. In a few cities the very bright are grouped in separate classes and 'opportunity classes' are provided for the less gifted. Provisions for the more able students may include extra promotions, extra options, or an enriched curriculum.

Since there is wide variety in the organization of curricula, and even in the number of subjects taught in a grade, it is not possible to provide a sample time-table for Canada as a whole. The curricula described below are those for Ontario, selected because in some ways it is a 'middle-of-the-road' province in these matters and the work undertaken in its high schools can perhaps be considered fairly representative of what goes on in the high schools of provinces other than Quebec.

The Ontario curriculum in the academic schools is designed to prepare students for entrance to the universities, teachers' colleges, nursing schools and such, through providing a well-balanced cultural education. In the first year students take a wide variety of subjects, 5 being compulsory: in the second and more advanced years the number of compulsory subjects is reduced, thus providing for individual differences and wishes, but choice is limited by university requirements. (Some years ago Greek, Latin and possibly two or more modern languages were necessary for entrance to some or most university courses, but such requirements have been gradually dropped, although a second language is still required for entrance to certain faculties or for advanced degrees.)

Pupils are expected to keep in mind university requirements for the various courses and to select the appropriate studies. It is also intended that in the choice of courses, the optional subjects selected should be persevered with from year to year so that some degree of specialization may be attained. It is further suggested that the more able students take an extra option, and others the minimum number required.

CURRICULUM OF GENERAL COURSE IN CITY HIGH SCHOOLS (ONTARIO)

Grade	Compulsory subjects	Optional subjects[1]	
9	English Social studies (geography) Mathematics (arithmetic and algebra) Physical education Vocational guidance	Science French Latin Art Music Home economics	Industrial arts Typing Business practice
10	English Social studies (Canadian history) Physical education	Mathematics (algebra and geometry) Science French Latin	Art Music Home economics Industrial arts Typing Business practice
11	English History Physical education	Algebra Physics French Latin Commerce Home economics Industrial arts	Art Music Agriculture German Spanish Italian Greek
12	English History Physical education	Geometry Chemistry French Latin Commerce Home economics Industrial arts	Art Music Agriculture German Spanish Italian Greek
13	English composition English literature Physical education	History Algebra Geometry Trigonometry Physics Chemistry Biology	Latin French German Greek Spanish Geography Music

1. In grades 9, 11, 12 and 13 the student chooses any 3 or 4 of the subjects listed; in grade 10 any 4 or 5. Outside the cities there would be fewer options, the actual number being dependent on the size of the school and the number of teachers.

A somewhat similar course of study is drawn up for commercial and vocational high schools. Both these types of schools include courses in English, social studies, physical education and mathematics, and provide for a number of options similar to those offered at the academic schools. The vocational courses offered at the high schools are intended to prepare students for types of work rather than for particular jobs.

In determining the time-table for a school it may be decided that optimum benefits can come from 8 periods of 40 minutes a day, which allows for 5 periods a week for most subjects. Only in Quebec is supervised study conducted on a large scale, although 'library periods' are included in most public school programmes. All provinces require homework of the students, the amount normally increasing grade by grade.

Methods in teaching vary rather widely. They include the lecture method, question and answer, discussion, laboratory period, demonstration and various combinations

of these. Auditory and visual aids are in fairly general use, including radio programmes, some of which are prepared for a province or several provinces, television programmes, tape recordings and the use of tape recorders for language and speech classes, records, filmstrips, etc.

The amount of guidance provided varies from province to province and from school to school, and may include both educational and vocational guidance, with some help in solving social and economic problems. To help the students make vocational choices the schools often provide useful literature, make use of films, and hold 'vocation nights' at which people from various walks of life talk about their work. Counsellors are provided in many schools; some are qualified to interpret psychological test data, others teach part time and depend more on interviewing and offering advice.

The schools normally report to the parents in the fall (September–November), at the end of December, at Easter, and make a final report for the year at the end of June. Where Departmental examinations are used for the final years, reports come from the Department of Education. Promotions at secondary level are normally made at the end of the school year; pupils may be held back if they have failed in 3 or more subjects. At one time province-wide examinations were conducted for all high school grades. At present they are usually held only for the senior year or for the last 2 years of high school, and even then a fair percentage of students who have done satisfactory work during the year, as determined by the school tests, may be recommended for the next grade or for entrance to university.

Vocational and technical schools

Vocational education financed from public sources is provided in three types of institution:

1. Vocational secondary schools operated by certain municipal school boards which provide vocational and academic classes, in which the students' time is divided more or less evenly between the two; these courses have a definite occupational objective and workshop instructors must be qualified tradesmen with teacher training.
2. Trade schools, usually operated under provincial government departments, which offer a variety of courses, ranging in length from a few weeks to 2 years, for youth and others who are either employed or seeking employment. Emphasis is placed on the development of skill in a particular trade. Students range from grade 8 to high school graduation. Courses are flexible and can respond rapidly to community needs. Facilities vary from temporary quarters to modern, well-designed trade schools.
3. Technical institutes which offer post-secondary, or advanced, technical courses for youth who expect to be employed as technicians or technologists, often with emphasis on science or mathematics in a general or specific field. There are also vocational correspondence courses provided by the provincial governments.

Trades are often taught through apprenticeship courses. About half of the apprentices attend the provincial trade schools for part of their apprenticeship; the other half are trained on the job by the companies which employ them. The armed forces provide training for their recruits, ranging from simple trade training to the production of skilled technicians in a variety of fields.

Evening classes are offered in most of the technical and trades schools. The courses usually extend over 20 weeks in the fall and winter months with sessions of 2 or 3 hours. They are designed for employed persons who desire upgrading through greater knowledge of trade theory and practice.

A description of vocational education in all provinces would require too much space. Instead, provisions in Quebec and Ontario will be described, these two different systems covering between them most of the various kinds of organization found throughout Canada.

Quebec. A separate Department of Youth and Social Welfare assists in the vocational education and social adjustment of young people, and several government departments operate more than 50 schools offering trade and technical courses. These are at two levels: technical courses of 3 years and trade courses requiring 2 years.

The technical courses consist of approximately two-thirds technical and academic studies, and one-third shop practice. Entrants must have completed 3 years of high school, or 2 years of high school plus an additional preparatory year. Emphasis is on a core of academic and technical subjects which is common to all courses and the same in all schools. The shop speciality is an option selected from a wide variety of skilled trades including: automobile mechanics, construction, woodworking, diesel mechanics, electricity, electronics, foundry work, furniture making, linotype operating, press operating, typography, offset printing, industrial chemistry, machine-shop practice, marine trades, papermaking, plumbing and heating, refrigeration, sheet-metal working, textile designing, weaving, toolmaking, welding, etc.

Students may take the first 2 years of the course in any of the 36 trade schools. Standard annual examinations are set and a 'jury' is selected to judge the standing of all graduates. The basic course comprises algebra, geometry, trigonometry, physics, chemistry, sociology, mechanics, electricity, drafting, sketching, history, geography, language, cost accounting and industrial legislation. There are 7 specialized schools for automobile work, furniture making, graphic arts, marine courses, papermaking and textiles. Tuition fees are from $40 to $50 a year for residents of the province, $100 for other Canadians and $200 for non-Canadians. There are many scholarships and bursaries.

The trade courses of 2 years' duration are made up of two-thirds shop practice and related theory, and one-third academic studies. Completion of grade 7 or grade 9, and success at an entrance examination are the requirements for enrolment in trade school courses. Although emphasis is on trade practice and theory, students spend about 15 periods a week on courses in language, drafting, mathematics, science, social studies, and business practice. The following trade courses are offered: automobile mechanics, auto body repair, electricity, foundry work, machine shop, pattern making, radio servicing, refrigeration, sheet metal working, smithing, welding and woodworking. Not all of these trade courses are offered in all schools. Special

courses are organized from time to time for upgrading tradesmen and in some schools shorter courses are still offered. Commercial courses are given in the regular secondary schools.

Full-time trade courses, mainly in the building trades, are given to apprentices in 10 centres, but these are under the Department of Labour. One of the trade schools specializes in the shoe manufacturing trade. Additional courses in areas related to their interests are offered by schools under the Departments of Fisheries, Agriculture, Lands and Forests, and Mines.

Ontario. Vocational education is a responsibility of the Department of Education, and is provided in provincially operated institutes of technology, municipally operated secondary schools and one institute of trade which provides trade training for apprentices and fee-paying students.

The institutes of technology provide post-secondary training for technicians and technologists in a variety of courses. The best known, Ryerson Institute, offers 21 full time 3-year courses such as architectural, aeronautical, chemical, electrical, gas, mechanical and metallurgical technologies. Three other institutes offer some of these courses with one specializing in mining, another in textiles. The former Lake Head Institute is now a junior college offering first year university work and 2-year technical courses in mining and forestry.

Industrial and commercial courses at high school level are offered in over 60 vocational, commercial and composite high schools. The courses of study, which have already been referred to under 'General secondary schools', are designed to give (a) the foundation of a general education to ensure good citizenship, and (b) specialized basic training in various fields of work. Courses last 4 years and lead to an industrial secondary school diploma in one of the 25 specialized shop and commercial subjects, e.g., aircraft mechanics, applied electricity and electronics, auto mechanics, drafting, machine shop practice, and trades connected with construction.

For the most part the other provinces are following the Ontario pattern of providing post-secondary institutes, secondary schools combining vocational training with general education, and provincial trade schools. Advisory committees are organized for most institutes.

A start has been made towards providing vocational training for residents of the territories. Academic and vocational courses in mechanical trades and building construction were begun in Yellowknife in September 1958 and despite difficulties it is expected that the programmes will expand.

In all provinces there are private trade schools. The majority are business and commercial schools but others offer training in welding, electricity, printing, beauticulture, barbering, etc. A few others provide correspondence courses on a wide variety of subjects. Most of these advertise on a national basis and some of them are branches of companies operating outside Canada.

Secondary school teachers

Teachers in secondary schools are generally university graduates with a bachelor's degree and one year of professional training. Of recent years, there has been a trend towards having all teacher training given in the universities or in colleges affiliated to the university. In British Columbia, Alberta and Saskatchewan, secondary teachers in training, after completing high school, take a 4-year course, one-quarter of the time being devoted to professional training, the other three-quarters to academic subjects. Teachers may also enter post-graduate schools to obtain advanced degrees in education.

There is comparatively little active recruitment of secondary school teachers as it is hoped that the profession will attract sufficient teachers. The present situation is difficult because the number of secondary pupils is increasing rapidly, while teachers must be recruited from age-groups born when the birth rate was lower and the population smaller.

Out-of-class activities

Since these activities are optional, it is difficult to generalize about them for they vary considerably from one school to another in all provinces. School boards and parents, however, usually encourage teachers to assist with sports, music and the formation of suitable clubs. The sports programme may come rather close to being a part of the physical education programme, or may be quite distinct with organization and participation off the school grounds. Among the programmes undertaken are calisthenics, tumbling, baseball, football, basketball, hockey, curling, etc. Participation in games may be within the school, inter-school, or by membership in a municipal or other league. Clubs include glee clubs, choir, drama, photography, radio, stamp collection, checkers or chess. Occasionally some group excels and earns local or national acclaim. Individuals may get started in an activity which becomes a life-long avocation or vocation for them.

Student councils, whose members are elected by the student body for the year, are common. Usually they have considerable autonomy although guided by one or more staff advisers. To a certain extent they may operate the sports programme, have some control of student discipline, earn money through plays, concerts, exhibitions and such, run a school paper, and be responsible for the school yearbook.

In some schools membership of school athletic teams is contingent on good class work as well as athletic ability. Some schools give letter or other awards for proficiency in competitive sports, and for excellence in field or track events at a field meet.

Some pupils do not take part in extra-curricular activities because they hold part-time jobs which require much of their out-of-school time. Some take these jobs to earn money to defray expenses, others because they want more spending money.

TRENDS AND PROBLEMS

In Canada there are some educational problems which are common to all provinces, although perhaps not equally acute in all cases, and others which are found only in one or several provinces. Likewise present educational trends

are at different stages of evolution and are progressing with different degrees of momentum from province to province. Some of these are a result of expanding frontiers, growth of industry and urbanization, some degree of inflation, a high birth rate and greater demands on the schools. Others have resulted from a lack of selection of secondary school entrants according to ability, a scarcity of well qualified teachers, and a lack of motivation on the part of many students who are often strongly influenced by the social group to which they belong.

Canada's population has increased by some 1.5 per cent per year during the past 15 years. In 1948, 350,000 babies were born; in 1956 the number had increased to 450,700. After 10 or 11 years many of these children will be entering high school. At the present time 250,000 pupils enter the publicly operated secondary schools each year, compared with 129,000 only 10 years ago. For every 30 to 40 pupils in excess of the previous year's total an additional room and teacher are required—which gives some idea of the extent of the problem of obtaining money, schools and qualified teachers.

High school enrolment is growing in all provinces. This expansion, while general, is particularly noticeable in the suburbs of the cities and is part of a continuous movement towards urbanization. The need to provide equal high school facilities for rural youth presents probably a more difficult problem. Considerable progress has been made; the 1951 census data showed that 93.5 per cent of rural children aged 10–14 were at school, a figure slightly higher than that for urban children. At ages 15–19, however, only 38.2 per cent of the rural population remained at school compared with 42.7 per cent of urban youth of the same ages. These figures were, however, considerably better than those for 1941 when only 30 per cent of rural youth 15–19 remained in school compared with 41.3 per cent of urban youth. Much of this improvement has been due to an increase in the number of central high schools, whether in a town or village or rural areas, and the expansion of school bus services and other means of transportation, or in a few cases the use of hostels.

Today two-thirds of all elementary school pupils enter high schools and many of those who drop out do so because of financial reasons or because there is no high school for them to attend. There has been little selection according to ability among high school students, who exhibit a wide range of native and acquired abilities. This may account for some of the criticism of Canadian education found in papers, magazines, books, and elsewhere. The provinces have not solved the problem of providing a curriculum which satisfies the needs of all pupils; nor is it likely that they will do so for some time, since too many conflicting forces, ideas, and hopes are at work. Differences of opinion centre on a number of points. Must the high school provide for everyone or should it be selective, eliminating all those who will not be a credit to the institution and warrant a college education? Is the answer to provide many electives so that all may benefit? Should pupils be allowed to select subjects at will? Is the composite school the answer or is it detrimental to good scholarship? Is streaming enough, or is it necessary also to have differentiated curricula leading to further education and to various occupations? What should be the basis for streaming? These are the kinds of questions being asked, and there is no one acceptable answer to any particular problem. Meanwhile most provinces are making changes in organization, curricula and teacher training and generally improving their system.

Lack of motivation on the part of many pupils, dropouts and retardation indicate unsolved problems for which the organization, the curricula, the teacher and the pupil have at times been blamed. To improve the situation an education survey was undertaken by the Canadian Education Association in 1942, and a report was also produced by a Canadian Research Committee on Practical Education. The CEA-Kellogg Project in Educational Leadership was begun in 1952 and, in some measure, continues today. All of these have had an influence on changes which have been introduced during the past 15 years. Recently the Atkinson Study in Ontario, and somewhat similar studies in Alberta and the Maritimes—the essential aim of which is to identify and 'measure' senior students and see what happens to them after leaving school—have been undertaken with a view to throwing light on such problems as providing a better selection device for university entrants.

There is need for expansion of vocational education. While a fair percentage of all employees can be quickly trained on the job, there are still many inadequately trained personnel filling semi-skilled and skilled jobs, and unfilled demands in many areas. More technical, vocational and trade schools are being organized each year. One problem at present is that whereas most city pupils who finish the elementary division have a choice of type of secondary school, this is only true for rural pupils who live in an area served by a composite school. Unfortunately in some city schools a practice has grown up of directing pupils who do poorly in academic courses to vocational schools, whether they have any vocational ability or not.

Today more is expected of the schools than ever before. They are in fact turning out many more well-educated graduates than previously, despite criticism from all sides, often offered because the passage of time has enabled the shortcomings of the schools of previous generations to be glossed over. Canada's present acute need for more and better scientists, engineers, and technicians in the face of keener world competition has pointed up the demands on our schools at a time when they are bursting at the seams from record enrolments.

STATISTICS

Population (mid-year 1958 estimate): 17,048,000.
Area: 3,851,116 square miles; 9,974,375 square kilometres.
Population density: 4 per square mile; 2 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, there were over 3.8 million pupils and students enrolled in all levels of education. This figure does not include some 340,000 adults attending evening and other part-time courses in general and vocational subjects; 33,000 students enrolled in summer session, evening, correspondence and other university courses; 6,000 students receiving post-secondary vocational education below the university level; an unknown number of pupils enrolled in private secondary vocational schools; and at least 40,000 pupils in schools for special education. Thus it may be estimated that about one-fourth of the total population was receiving formal education of some kind. Kindergarten classes in elementary schools accounted for about 3 per cent of the total reported enrolment; elementary grades (1–8 or 1–7) for 74 per cent; secondary education for about 20 per cent and institutions of higher education for 3 per cent. The proportion of girls was 49 per cent in kindergarten classes; 48 per cent in the elementary grades; 50 per cent in general secondary schools; 82 per cent in teacher training institutions; and 23 per cent in other institutions of higher education. Women teachers made up about 83 per cent of the teaching staff in public primary schools, where there was an average of 27 pupils per teacher as compared with 17 pupils per teacher in the private schools.

Between 1953 and 1957, enrolment had increased by 18 per cent at the primary level, by 14 per cent at the secondary level, by 27 per cent in the teacher training schools, and by 33 per cent in the institutions of higher education. (See Table 3.)

Enrolment trends in secondary education, 1930–57. Between 1930 and 1948, total enrolment in secondary education, general and vocational, increased by nearly one-half. The proportion of girls fluctuated between 55 and 59 per cent. From 1950 to 1957, there was another increase of 49 per cent in total enrolment of secondary schools (including vocational education provided in these schools). The proportion of girls remained constant between 51 and 52 per cent. Taking average enrolment by 5-year periods, the increase was nearly one-third between the 1930–34 and 1945–49 periods, raising the enrolment ratio from 35 to 45, when related to the estimated population 15–19

years old. For the period 1955–57 the enrolment ratio is calculated at 49, based on the enrolment of secondary schools only. (See Table 4.)

Examination results in secondary education, 1953–57. Table 2 gives partial data on examination results, covering only certain types of vocational courses. There was a 42 per cent increase in the number of trade school certificates granted in 1957 over 1953, and a 24 per cent increase in vocational commercial certificates. The number of certificates for marine, fishery and forestry courses increased two and a half times and the number of home economics and nursing school certificates one and a half times over the same five-year period.

Educational finance, 1956. In 1956, total expenditure on education amounted to 911 million Canadian dollars (including debt service of 82 million dollars), averaging 57 dollars per inhabitant. Seven per cent of this amount came from the Federal Government, 40 per cent from the Provincial Governments, 43 per cent from local authorities, and the rest from tuition fees, gifts and other sources. Recurring expenditure, representing 84 per cent of the total expenditure, was distributed by level and type of education as shown in Table 1C.

1. More than half the teachers in public kindergarten classes and all teachers in private kindergarten classes teach also in elementary schools. They are included in both pre-primary and primary education.
2. Enrolment in private schools is estimated.
3. Public schools only.
4. Enrolment in grades 1–8 in all provinces except Quebec, where 'elementary' level comprises grades 1–7.
5. Including secondary schools providing vocational courses.
6. Including all teachers teaching in secondary grades only, minus an estimate for those teaching vocational subjects, plus a proportion of those teaching both in primary and in secondary grades.
7. Enrolment in public schools includes students in vocational courses. Enrolment in private schools refers to academic courses only, not including students in secondary grades of normal schools and classical colleges in Quebec province, who numbered 19,998 (F 2,716) in 1957/58.
8. Number of institutions where the type of training mentioned is offered. Institutions offering more than one type of training are listed under each type.
9. Full-time students taking the regular vocational programme at the second level and who spend at least 50 per cent of their time in the vocational field with the other 50 per cent allotted to social sciences, history, languages, mathematics and sciences, etc.
10. Full-time students taking a trade course of a very practical nature.
11. Including duplications, since institutions offering more than one type of training are counted as many times as there are types of training offered. The actual number of institutions is around 500 to 600.
12. Not including data on agricultural education.

1946	482 638	57	480	1 072	*45*
1947	479 537	56			
1948	485 458	57			
1950	418 053	52			
1951	425 382	52			
1952	449 817	52	459	1 076	*43*
1953	479 914	51			
1954	522 135	51			
1955	522 093	51			
1956	663 118	51	569	1 168	*49*
1957	621 427	51			

Note. Data for 1930 to 1948 refer to secondary and vocational education; from 1950 to 1957, data refer only to secondary schools (including vocational courses provided in these schools) exclusive of some 20,000 pupils enrolled at classical colleges in Quebec province.

CEYLON

THE EDUCATIONAL SYSTEM

Education in Ceylon is universal, compulsory and free. It is universal in the sense that there are no restrictions of caste, creed or community in the matter of admission to schools or of educational provision in general. It is compulsory between the ages of 5 and 14, except where there is no school within a reasonable distance of the pupil's home. Lastly, it is free from the kindergarten up to and including university; the only exceptions to this rule are a handful of unaided schools which do not receive grants from the Government and are permitted to charge fees.

The statutory basis of the educational system as a whole is Ordinance No. 31 of 1939—'an Ordinance to make better provision for education and to revise and consolidate the law relating thereto'—as amended by Ordinance No. 26 of 1947, by the Education (Amendment) Act No. 5 of 1951, the Education (Amendment) Act No. 43 of 1953 and the Education (Amendment) Act No. 37 of 1958.

Section 32 of the Principal Ordinance No. 31 of 1939

empowers the Ministry of Education to make regulations (known as the Code) for the purpose of giving effect to the principles and provisions of this Ordinance.

The 'dual' system of educational control operates in Ceylon. Schools are owned either by the Government or by private (denominational) bodies—roughly 53 per cent of the 7,674 schools in 1958 were owned by the Government and 47 per cent by private bodies. However, in all but a few unaided schools, the entire cost of salaries and almost the entire cost of the maintenance of schools is met out of government funds. Since 8 May 1957 the establishment of private aided schools has been stopped.

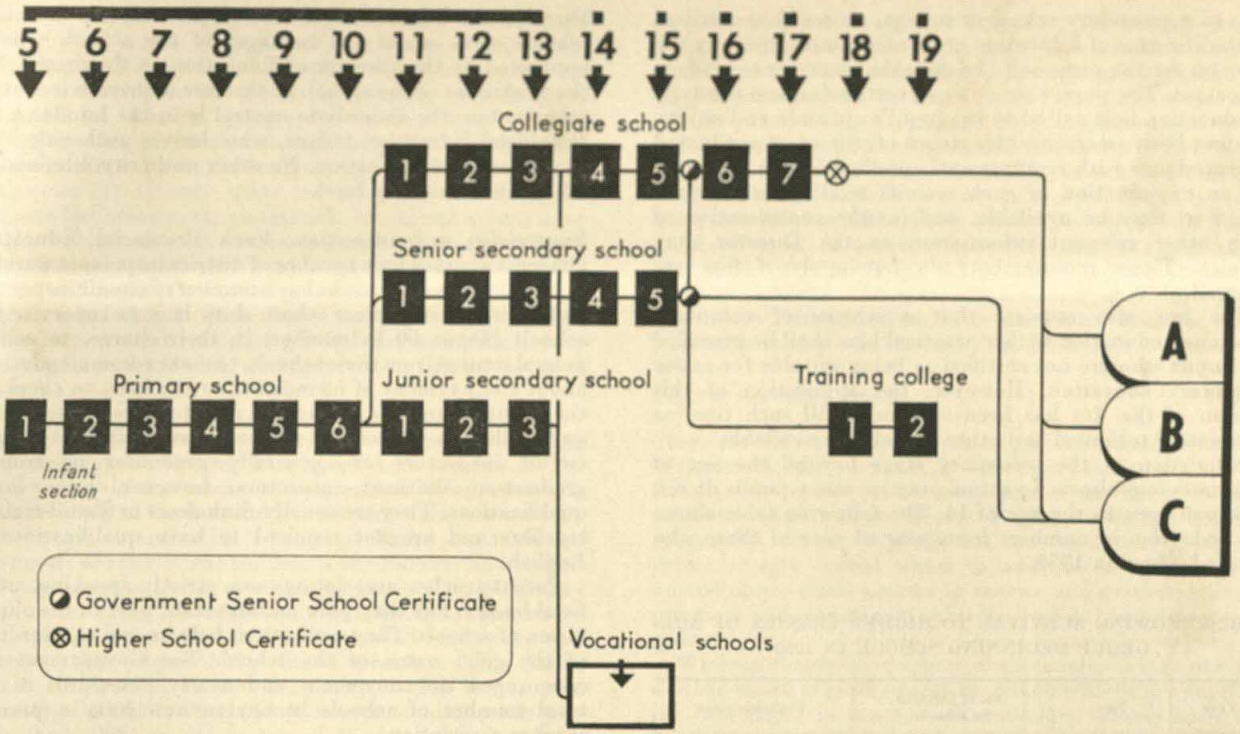
Till quite recently schools were classified not only according to the method of financing, i.e., as government and assisted schools, but also as English, bilingual, and vernacular schools. While the division of schools into government and assisted continues, with the addition of a new category—unaided schools—the division into English, bilingual, and vernacular has ceased. The medium of education today is English only in the case of a very small number of children whose mother tongue is English and of a comparatively small number of Muslims. The vast majority of the children are educated through the medium of Sinhalese or Tamil, with English as the compulsory second language from standard 3 (the fourth year) onward. The mother tongue was introduced as the medium of instruction in 'English schools' in 1947 in the lowest class; thereafter it was introduced progressively from year to year to the next higher class. On 1 January 1953 the mother-tongue began to be used as the medium of instruction in the lowest class of secondary schools (standard 6). Thereafter it continued to be used progressively until in 1959 it became the medium of instruction in the Higher School Certificate (final class). The only exception to this rule has been that certain science subjects have been permitted to be taught in English at the senior secondary and the H.S.C. stage and that certain other subjects like foreign languages and mathematics may also be taught in the English medium until further notice, partly for want of suitable textbooks and partly for want of teachers qualified to use the national language medium.

The provision of education is solely the responsibility of the Central Government. No local government authority in Ceylon makes any contribution whatsoever towards the cost of education in the country. The Ordinance, however, provides for local advisory committees to help the Government by advising it on such matters as the need for and siting of new schools. These committees consist of the Government Agent of the district, the Education Officer, the Member of Parliament, representatives of local government institutions, divisional revenue officers, etc.

The structure of the school system is shown in the diagram on page 335.

THE DEVELOPMENT OF SECONDARY EDUCATION

A turning point in the history of secondary education in Ceylon was the decision to hold the Cambridge Senior and Junior Local examinations in the Island as from the year 1880; up to that time, the vast majority of schools made no provision for education beyond the primary stage. The holding of the Cambridge local examinations in Ceylon introduced the element of competition and provided a very necessary fillip. In 1882 the London Matriculation examination was introduced.



The report of Mr. J. J. R. Bridge, an Inspector of Schools of the English Board of Education, along with that of an Education Committee appointed in 1911 to survey and make recommendations on secondary and higher education, also played an important part in the development of secondary education. The committee recommended the establishment of a university college and suggested that Sinhalese and Tamil be made compulsory second languages in the primary classes; it also recommended the establishment of an Elementary School Leaving Certificate to be awarded on the results of an examination taken in standard 8 (at the end of the ninth school year), and the development of commercial education and a system of grants for school buildings. As a result of a recommendation by this committee, the system of 'payment by results' which had been in vogue in the large majority of schools up to 1911 was altered and grants began to be paid to assisted schools on the basis of average attendance of pupils.

During the first quarter of the present century there were thus two streams of secondary education: one (and this was much the broader) led beyond standard 5 to the Elementary School Leaving Certificate; the other led to the Cambridge Junior and Senior Certificates and the London Matriculation. Strangely enough, the stream leading to and ending with the Elementary School Leaving Certificate was not regarded as providing a secondary education. Subjects taught included English and the mother tongue, arithmetic (only a very small number offered mathematics), history, geography, rural science, hygiene, and shorthand, book-keeping and typewriting. Indeed the last three subjects were in a sense the *raison d'être* of the course and the examination. Those taking the E.S.L.C. were generally regarded as being prepared for commercial careers in mercantile establishments and on plantations. A fair number would enter government service as railway guards, booking clerks, apothecaries, surveyors, etc.

The stream that led up to the Cambridge examinations was regarded as preparing for the learned professions—law, medicine, etc. In actual practice, however, the majority found their way into the Civil Service. For 90 per cent at least of the 'English' schools, helping their pupils to obtain government employment was the main goal of education. This does not mean that character training was neglected or that there was no effort to give a good general education.

The inadequacy of the Elementary School Leaving Certificate examination as an end in itself was realized and early in the 1930s it was renamed the Junior School Certificate Examination and a new examination, taken in standard 10 and known as the Senior School Certificate Examination was started. These examinations were conducted in English as well as in Sinhalese and Tamil. The syllabuses did not reach as high a standard as those for the Cambridge examinations, and to start with only the rural schools were interested in preparing pupils for the Senior Certificate examination.

When the Cambridge examination first, and a little later, the London Matriculation examination were given up, the

GLOSSARY

collegiate school: complete general secondary school.
infant section: the first three classes of the primary school.
junior secondary school: lower general secondary school.
senior secondary school: general secondary school not preparing for university.
training college: teacher training college.
vocational schools: vocational training schools not under the Education Department.

HIGHER EDUCATION

A. Law College.
B. University.
C. Technical College.

J.S.C. and S.S.C. examinations became more popular. The J.S.C. was also dropped subsequently as it was felt that two examinations in the final years of schooling imposed too big a strain on pupils. For the last 15 years the S.S.C. (Senior School Certificate) examination has been the only examination and the numbers taking it have increased from year to year. Today nearly 100,000 take the December examination and more than half that number the one held in July-August. Following English practice, the examination was renamed the General Certificate of Education (Ordinary level) Examination in 1954.

Legal basis

Secondary education is governed by the same laws and regulations as govern education in general (see above). The Education (Amendment) Act, No. 5 of 1951, established the following types of school: (a) primary school, which provides full-time education up to and inclusive of standard 5 (a 6-year course with a 2-year infant department taking the place of standard 1); (b) junior secondary school, which provides full-time education from standard 6 up to and inclusive of standard 8; (c) senior secondary school, which provides full-time education above standard 8 and up to and inclusive of the standard of the Senior School Leaving Certificate examination or of an equivalent examination approved by the Director for the purpose, whether or not such school also provides full-time education from standard 6; (d) a college, that is to say a school which provides full-time education up to and inclusive of the standard of the Higher School Certificate examination or of an equivalent examination approved by the Director for the purpose, whether or not such school also provides full-time education from or above standard 6.

A primary school may be maintained and administered together with a junior secondary school or a senior secondary school but not maintained together with or in the same premises as a college.

This Act also made provision for selection at the end of the junior secondary stage (standard 8). A pupil is not admitted (or promoted from a lower class) to any senior

class in a secondary school or college, unless he is certified by the Director of Education or an officer authorized by the Director for the purpose to be suitable for senior secondary education. The pupil cannot be so certified unless the type of education best suited to the pupil's aptitude and ability has first been ascertained by means of: (a) a test conducted in accordance with requirements specified by the Director; (b) an examination of such records relating to his past career as may be available, and (c) the consideration of such other relevant information as the Director may require. These requirements do not apply if fees are charged.

The law also requires that a scheme of voluntary continued education with a practical bias shall be provided for pupils who are not certified as being suitable for senior secondary education. However, the application of this section of the Act has been suspended till such time as alternative technical and other schools are available.

Education at the secondary stage beyond the age of 14 is not compulsory. In actual practice many pupils do not continue even to the age of 14. The following table shows the reduction in numbers from year to year of those who entered school in 1950.

TABLE SHOWING SURVIVAL TO HIGHER CLASSES OF AGE-GROUP BEGINNING SCHOOL IN 1950

Year	Age	No. of children in schools	Probable class
1950	5—6	164 101	Lower kindergarten
1951	6—7	171 270	Upper kindergarten
1952	7—8	173 963	Standard 2
1953	8—9	167 798	Standard 3
1954	9—10	159 110	Standard 4
1955	10—11	148 023	Standard 5
1956	11—12	128 982	Standard 6
1957	12—13	119 512	Standard 7
1958	13—14	103 724	Standard 8
1959	14—15	89 699	Standard 9

Administration

Secondary education, like primary education, is planned and organized by the Department of Education with the advice and control of the Ministry of Education. A Central Council advises the Director of Education on matters referred to it. The Chief Inspector's Section of the Department of Education is responsible for revision of the curriculum and of syllabuses as and when such revision is necessary. No textbook can be used in schools unless it is on the list of books approved by the Educational Publications Advisory Board, of which the Director of Education is the chairman. On the question of policy, the Ministry makes decisions and gives directives.

Control. Primary and secondary education are controlled solely by the central educational authority, i.e., the Ministry of Education acting through the Department of Education. In the case of government schools, the head of the school is directly under the control of the Education Officer of his province, who in turn comes under the Director of Education. Heads of private (i.e. assisted) schools work under the manager of the school, who is appointed by the Director of Education on the proposal of the proprietor of the school. In the case of private (assisted) schools, too, the immediate control is in the hands of the Provincial Education Officer, who derives authority from the Director of Education. No other authority administers schools at secondary level.

Supervision and inspection. Each Provincial Education Officer is assisted by a number of district inspectors working in his office. In addition he has a number of circuit inspectors and assistant inspectors whose duty it is to supervise the schools (about 60 in number) in their charge, to collect annual returns from these schools, to make recommendations about the payment of increments to teachers, to check on the furniture and equipment and maintenance of the schools and buildings. Education officers, district inspectors and circuit inspectors are generally graduates or trained graduates. Assistant inspectors, however, have lower qualifications. They are usually Sinhalese- or Tamil-trained teachers and are not required to have qualifications in English.

Parent-teacher associations are, strictly speaking, unofficial bodies, but they play an important part in the supervision of schools. They act both as helpers and as guardians of the good name of the school. The Government has encouraged the movement and nearly two-thirds of the total number of schools in Ceylon now have a parent-teacher association.

Finance. The entire cost of education in government schools is borne by the Government. In the case of assisted schools the entire salary cost of 'eligible' teachers is borne by the Government, and in addition these schools receive a grant for maintenance and equipment; the 'eligible' staff is calculated on the average attendance. As already explained, no fees are charged except in the case of a few unaided schools. But no assistance is given to parents.

Buildings and equipment. The Code of Regulations for Assisted Schools, which may be regarded as applying to all schools in the Island, lays down requirements for accommodation, furniture, apparatus, sanitation, etc. It specifies that classrooms must provide 13 square feet per unit of average attendance of all pupils, and have a minimum length and breadth of 9 feet.

School welfare services. Every child in school is given a free midday meal on each school day; this meal consists of a 2 oz. bun and a glass of milk reconstituted from 1½ oz. of skim milk powder.

TYPES OF SECONDARY EDUCATION

Up until quite recently the only type of secondary education available to pupils in Ceylon schools was the strictly academic type. At the end of the 6-year primary stage (standard 5) the pupil went on to standard 6 (or form 1) either in the same school or in a neighbouring school which had provision for classes beyond standard 5. The education

provided at the secondary stage included science and mathematics in only about 10 per cent of the schools; these also taught Latin—and a handful of schools provided courses in Greek. In the remaining schools, the education consisted of history, geography, civics, hygiene and physiology, art, physical education and religion, in addition to the mother tongue, the compulsory second language and arithmetic. It is only quite recently that facilities for subjects like woodwork, metalwork, handicrafts, etc., have been provided; and up to now not more than about 5 per cent of all schools provide a practical education. In schools where facilities for the teaching of science and mathematics existed, admission to these classes was generally restricted to the better pupils, the less gifted being compelled, very often against their wish, to study the usual core of arts subjects.

Further education open to secondary school leavers. All learning in secondary schools has in a sense been geared to the requirements of the entrance examination for admission to the University of Ceylon, and it is the aim of every secondary school pupil to enter the University. There are, however, two points of restriction: the first is the number and combination of credits to be obtained at the G.C.E. (Ordinary level) examination, in addition to qualifying for the award of the Senior School Certificate; the second is the very stiff entrance test imposed by the University. This latter cannot be avoided as the University, which has a total capacity of about 2,300 students, is able to admit each year only about 900, or one in ten of those who seek admission.

The Vidyodaya and Vidyalankara Universities, two Pirivena universities which were inaugurated a little over a year ago, promise opportunities to those for whom the University of Ceylon has failed to provide. These universities offer degree courses to external as well as internal students and thus give an opportunity to a large number of secondary school leavers who have had to enter employment, because of poverty for example, but who wish to obtain a degree.

The Ceylon Law College admits students who have obtained a certain number and combination of credit passes at the G.C.E. (Ordinary level or Advanced level) examinations; the number of admissions to the courses for advocates and proctors is about 50 each year.

The Ceylon Technical College functions as a separate department under the Ministry of Education and is the principal institution in the Island providing training for junior technical grades. The courses of study are: (a) engineering, (b) vocational and (c) commercial. Recently junior technical schools under the control of the Director of the Ceylon Technical College have been opened at three provincial centres—Kandy, Galle and Jaffna.

The Department of Agriculture conducts schools of agriculture and farm schools and about 20 centres in various parts of the Island. It provides for the education of both men and women. The lower courses are for those who have reached standard 8; the higher courses are for those who have completed their secondary education.

The school year. Secondary, like primary, schools are open for a minimum of 180 days a year; the actual number of sessions varies between 180 and 200. The school year is divided into 3 terms, separated by vacations usually lasting about 4 weeks. The following arrangement for government schools in the current year will serve as a sample: first term, 4 January to 8 April; second term, 3 May to 28 July; third term, 22 August to 2 December. Assisted schools are free to fix their own school terms and some of them close for 6 to 7 weeks in April-May when it is hottest in Ceylon. All schools must close on the 13 public holidays, most of which are days of religious significance. The heads of government schools may at their discretion grant 3 holidays each year. The school week lasts from Monday to Friday, and each day must last 5 hours at least; in practice many schools work 6 hours a day.

General secondary schools

There are only two main types of general secondary school in Ceylon: (i) the rural school which prepares pupils for the G.C.E. (Ordinary level) examination in the following subjects: Sinhalese or Tamil, English, religion, history, geography, civics, hygiene, art and arithmetic; (ii) the urban or city school which in addition to the subjects named above offers courses in science and mathematics, in practical and commercial subjects, and in home science for girls.

While in theory the purpose of these schools is to provide a broad-based general education, which will equip a pupil for life in general, in practice all secondary schools have the immediate aim of preparing pupils for the G.C.E. (Ordinary level) examination, which in turn is the key either to higher studies or more often to employment. There has been hardly any vocational education in schools, and there are comparatively few vocational schools to which a pupil can go on leaving school. Every pupil in secondary school therefore aims at employment primarily—and generally prefers a white-collar job to one in which he will have to use his hands. This is most unfortunate in a country like Ceylon which depends on agriculture for its sustenance.

Except in the case of schools which have primary as well as post-primary sections under the same roof, selection for secondary education is usually by a competitive test held by each school separately. There is no common entrance test. The tendency is for pupils to try to gain admission to the better class of schools even where there is provision for secondary education nearer home. The result is that there is a great demand for admission to the better schools and a great deal of disappointment when admission cannot be obtained. The conditions for entry to the senior secondary stage have been mentioned under 'Legal basis'.

The central school. Special mention must be made of this particular development in the educational system of Ceylon. About 1945 the system of central schools was started. The idea was that in each of the 50 electorates which then existed, a secondary school with facilities for residence should be set up so that promising pupils from primary schools in the area might have the chance of receiving a better type of secondary education without having to migrate to bigger schools in towns. Each central school was also to have a hundred free scholars—50 boys and 50 girls selected on the result of a competitive test held annually

for applicants from the various primary schools in the electorate. The pupils thus selected were provided with free board and lodging and at one stage with free books and clothes. If they progressed satisfactorily up to the school leaving examination stage, their scholarship was extended for 2 or 3 years to enable them to study for university entrance; and if they were successful in gaining admission to the university, the scholarship was further extended to enable them to read for a degree in the university.

This system has now operated for nearly 15 years with excellent results. While in the past the great majority of admissions to the university were from urban schools—and these were mainly assisted denominational schools—at present at least 40 per cent of the admissions to the university in the faculties of arts and oriental languages are from the central schools. A large number of these schools have now been equipped with laboratory facilities, and science teachers have been included in the staff, so that in the near future it may be expected that a proportionately high percentage of admissions to the faculties of science and medicine will also be from the central schools. These schools are all equipped with workshops for the study of practical subjects. They also have specialized teachers for music and dancing.

A typical time-table for the 3-year junior stage at one of these schools is given below; each teaching period lasts 40 minutes.

TIME-TABLE OF JUNIOR STAGE OF CENTRAL SCHOOL
(in periods per week)

Subject	Standard 6	Standard 7	Standard 8
Religion	2	2	2
Intellectual development			
Sinhalese or Tamil	6	6	6
English	10	10	10
Arithmetic	3	3	3
Elementary mathematics	2	2	3
General science	2	2	2
History	2	2	2
Geography	2	2	2
Civics	2	2	2
Health and physical development			
Health lessons	1	1	1
Physical training	2	2	2
Practical development			
Handicrafts or gardening (boys) or home science (girls)	4	4	3
Aesthetic development			
Singing	2	2	2
Art	2	2	2
Oriental dancing or music (optional)	2	2	2

The teaching staff in these schools is made up of partly trained graduates, graduates, and partly secondary-trained teachers.

The teaching is generally well organized, the senior master in each subject being responsible for the organizing of the work in that subject throughout the school.

Fortnightly or monthly tests and three term tests are regularly held. In recent times the keeping of cumulative records and a guidance programme have been introduced.

Vocational and technical schools

Reference has already been made to the following: The Ceylon Technical College; the junior technical schools at Kandy, Galle and Jaffna; the School of Agriculture and the farm schools conducted by the Department of Agriculture.

In addition to the above, the Department of Rural Development and Cottage Industries conducts weaving schools in several parts of the Island. There are also a few schools where coir work, mat weaving, toy making, pottery, rattan work and similar crafts are taught. The Lanka Mahila Samiti—a women's organization—also runs a number of needlework and handicraft classes for women. There are 20 carpentry schools conducted by the Department of Rural Development. Each school has provision for 24 pupils. A secondary education is not necessary for admission to these schools. An advanced 4-year course in woodwork is also provided by the same department. When this project is in full swing, it will provide for the training of 800 carpenters at a time.

Teacher training schools

There are 22 institutions, of which 12 are government owned and the rest 'assisted-denominational', which provide a total of nearly 4,500 places for teacher-trainees. The course lasts 2 years and provides a broad-based general education in the first year and a specialized scheme of teacher training in the second. The staff consists of trained graduates and secondary-trained teachers for the most part. The pupils in these institutions are prepared for work in primary schools and in the junior classes of secondary schools.

In addition to the above, two Government Training Colleges, those at Maharagama and Palaly, train specialist teachers for secondary schools. The Training College at Maharagama has specialized courses for science teachers, teachers of mathematics, of handicrafts and of English as a second language. The College at Palaly provides courses for science, mathematics and English. One of the aims of these institutions is to train teachers to teach science, mathematics, etc., through the medium of Sinhalese and Tamil. The Maharagama institution serves the Sinhalese-speaking areas and the one at Palaly the Tamil-speaking areas.

Other specialized schools

The Government College of Fine Arts, which is the only institution of its kind in the Island, provides courses of instruction at an advanced level in drawing and painting, sculpture, art, crafts, North Indian music and Kandyan dancing. No tuition fees are charged for any of these courses. The standard of work compares very favourably with that of similar institutions abroad. Day as well as evening courses are offered and about 500 students at a time benefit from the courses provided.

Out-of-class activities

Between 100 and 200 schools are run on the lines of English 'public schools' and have the prefect system. Most

of the other schools have a system of class monitors who assist in a smaller measure in the running of the school.

Very great emphasis is placed on physical development outside the normal school curriculum. In the head office of the Department of Education there is a Deputy Director of Education responsible for the organization of physical and health education and of games in schools. An effort has been made in recent years to provide each of the 110 inspectors' circuits in the Island with a good-sized, well-laid-out playing field. In addition, most of the central schools and the bigger assisted schools have good playing fields. Every encouragement is given to athletics; competitions are run annually—first at a sub-circuit and circuit level, then at district, provincial and finally at an all-Island level. In this way nearly 5,000 of the 8,000 schools in the Island are involved in the annual all-Island athletic championships. Netball, volleyball, wrestling and other competitions are held annually. Many schools have junior and senior cadet corps. Scouting and Guiding are very popular.

TRENDS AND PROBLEMS

The big problem the Government of Ceylon is attempting to solve is how to gear the educational system to the national economy. The kind of education imparted in many schools is still bookish and determined by the needs of examinations rather than by those of the country's economic development. To correct this tendency school workshops for practical training are being set up, the teaching of science and mathematics is being intensified, and every encouragement is being given to the provision of training in gardening and agriculture for every schoolchild. Side by side with these problems are those occasioned by the switch-over from English to the mother tongue media, the difficulties of finding suitable teachers, suitable textbooks and suitable background literature, and the effective teaching of English as a second language. These and other problems are receiving the earnest attention of the Government and of educationists.

STATISTICS

Population (mid-year 1958 estimate): 9,388,000.
Area: 25,332 square miles; 65,610 square kilometres.
Population density: 371 per square mile; 143 per square kilometre.

Summary of school statistics, 1953–57. In 1957, total enrolment in all educational institutions was about 1,892,000 pupils, representing nearly 21 per cent of the estimated population. Of total enrolment, some 77 per cent were pupils in primary classes, 22 per cent in general secondary education, 0.2 per cent in teacher training schools, 0.3 per cent at university colleges and 0.1 per cent in special educational institutions. There were, in addition, about 2,400 people enrolled in night school classes. Girls made up about 46 per cent of enrolment in primary and secondary education and 27 per cent at the University of Ceylon. The teaching staff in all primary and general secondary classes numbered 57,469 in 1957 of whom 48 per cent were women. The average pupil-teacher ratio in primary and general secondary classes was 33 in 1957 against 34 in 1953. Compared with 1953, enrolment in primary and general secondary classes had increased by 20 per cent, in teacher training colleges by 25 per cent and in university colleges by 9 per cent. (See Table 2.)

Enrolment trends in secondary education, 1930–57. Enrolment in general secondary education, excluding some private schools, rose from 58,697 pupils in 1930 to 413,993 in 1957, an increase of over 600 per cent. Over the same period, the

1. Official exchange rate: 1 rupee = 0.21 U.S. dollar.
2. Not including data relating to the University of Ceylon.

proportion of girls to total enrolment rose from 27 per cent to 47 per cent. Enrolment in secondary-level teacher training had increased since 1945 by about 130 per cent. The estimated school-age population of 15–19 years rose from 549,000 in the period 1930–34 to 818,000 in the three years 1955–57, and the ratio of pupils enrolled passed from 11 in the years 1930–1939 to 42 in 1955–57. (See Table 3.)

Examination results in secondary education 1953/54–1957/58. From the data available on examination results, it appears that some 18,000 candidates, of whom over a third were girls, passed the Senior School Certificate in 1956/57. In the same year the Higher School Certificate was awarded to 313, of whom one third were girls, and there were 1,533 successful candidates, one fifth girls, for the General Certificate of Education at Advanced Level. Comparisons with earlier years are difficult owing to the incompleteness of the figures. (See Table 4.)

Educational finance, 1957/58. Excluding the University of Ceylon, total expenditure on education in 1957/58 (fiscal year beginning October) was 206,308,877 rupees, representing about 22 rupees per inhabitant. Of this sum, about 2 per cent was for capital expenditure and 5 per cent for debt repayment. The distribution of the remainder, 93 per cent, by level and type of education is given in Table 1B.

Note. About 60 per cent of the schools in Ceylon have classes from kindergarten to end of general secondary education, i.e., from kindergarten to standard 10. For this reason it is impossible to give separate figures for primary and secondary general education respectively.

1. Data on secondary vocational schools are not available for recent years. In 1954 there were 16 schools enrolling 2,024 (F. 914) pupils.
2. Including 1,455,727 (F. 664,541) primary level pupils and 426,704 (F. 198,499) general secondary level pupils in 1957.
3. Comprising the following: Leper Asylum and institutions for children suffering from tuberculosis, for deaf and blind children, for juvenile offenders and Welikada prison.
4. Schools for deaf and blind children only.

CHILE

THE EDUCATIONAL SYSTEM

Public education

The constitutional and statutory provisions relating to education include Article 10(7) of the Constitution, which guarantees freedom of education and stipulates that public education shall be a principal concern of the State and that primary education shall be compulsory. As a consequence of the unitary administrative organization of the State established by Article I of the Constitution, the Central Government assumes almost complete responsibility for financing and administering the educational system, through a Ministry of Education.

The Ministry of Education comprises the Superintendency of Education, the *Subsecretaría* (office of the Under-Secretary, administrative head of the Ministry), and the Directorates-General of Primary Education, of Secondary Education, of Agricultural, Commercial and Technical Education, and of Libraries, Archives and Museums.

Article 1 of Law No. 104, which set up the Superintendency of Education, provides that that body is responsible, under the authority of the Government and without prejudice to such guarantees in the matter as are contained in the Constitution, for the general direction and supervision of national education, i.e. education provided directly by the State.

The Superintendency of Education comprises the National Council of Education, the Oficina Técnica de Investigaciones Educacionales y Servicios Especiales (charged *inter alia* with conducting technical investigations and organizing special services) and the National Education Fund.

The National Council of Education consists of the Minister of Education, who presides over it, the Superintendent of Education and Under-Secretary (*Subsecretaría*), the rectors of the University of Chile and the State Technical University, the rectors of private universities recognized by the State, the Directors-General of Education, the Dean of the Faculty of Philosophy and Education of the University of Chile, the Director of the Instituto Pedagógico Técnico (specialized training college for teachers in vocational schools) and representatives of various teachers' associations, bodies connected with production and with private education, parents' associations, etc.

A network of services responsible to or connected with the Ministry of Education has also been established. Among the most important of these are the National Committee for Assistance to Schools (Junta Nacional de Auxilio Escolar); the Society for the Construction of School Buildings (Sociedad Constructora de Establecimientos Educacionales), and the Fund for the Building and Equipment of Public Educational Establishments (Fondo para la Construcción y Dotación de Establecimientos de la Educación Pública).

Since, under the terms of its Constitution, Chile is a unitary State, there are no provincial governments as such with authorities elected by popular vote. The *Intendentes*, who are the highest authority in each province, are appointed directly by the President of the Republic and, by delegation of powers, administer the provinces and superintend all the provincial services.

The Primary Education Service is the only one which has provincial authorities: the provincial directors who, like the *Intendentes*, are appointed by the central authorities, to whom they are directly responsible. Coming under the provincial directors of primary education there are also departmental or local directors.

Under Article No. 101 of the Constitution, the administration of communes devolves upon the municipalities, which are responsible in particular for promoting education (Article No. 105(2) and (3) of the Constitution) and for attending to primary schools and other educational services financed from municipal funds.

In compliance with these provisions some municipalities support educational establishments, mainly primary schools.

The structure of the Chilean school system is shown in the diagram on p. 345.

Primary education is governed by the Law on Compulsory Primary Education passed in 1920 and promulgated in its final form by Decree No. 5291 of 22 November 1929. This law establishes the principle of compulsory schooling for children between the ages of 7 and 15 and up to the sixth year of primary schooling. Attendance at rural schools is compulsory only up to the fourth year of study if no complete school is within reach. The law also accepts the principle of experimentation and specifies the standards to which experimental schools should conform. The Directorate-General of Primary Education administers and supervises the work of all the country's primary schools, pre-primary classes, vocational primary schools and courses, experimental schools, primary classes in consolidated schools; schools for handicapped children; primary schools for adults and adult education courses; civic literacy groups and fundamental education centres.

General secondary education is governed by various decrees (see below under the section 'Legal basis') which describe its aims and objectives, its curricula and syllabuses, the organization and operation of *colegios* (private schools) and the system of marking examinations and promotions. The Directorate-General of Secondary Education is responsible for the administration and supervision of all *liceos* (general secondary schools) in the country, of the primary schools attached to *liceos* (*escuelas primarias anexas*) and of the secondary classes in consolidated schools.

Secondary vocational and technical education comes under the Directorate-General of Agricultural, Commercial and Technical Education. It encompasses industrial schools, technical schools for girls, agricultural schools, commercial institutes and polytechnical institutes. The aims, curricula

and syllabuses and the organization of establishments in this branch of education are laid down in decrees issued by the Ministry of Education (see below).

Higher education is governed by the Organic Law on University Education, establishing the structure of the University of Chile and its relations with the private universities, which was promulgated by Decree No. 280 of 20 May 1931. The State Technical University was established by Law No. 10259 of 27 February 1952, which also determined its organization.

Staff coming under the Directorate-General of the Ministry of Education are governed, in general, by the Administrative Law (Decree No. 256 of 29 July 1953) which lays down standards and benefits applying to all civil servants and, in particular, by the *Estatuto del Magisterio* (Decree No. 280 of 5 August 1953) regulating the teaching profession.

Private education

In accordance with that provision of the Constitution which guarantees freedom of education, private education, from pre-primary to university level, has developed alongside public education. The Superintendency of Education is responsible for ensuring that private education is conducted in accordance with the aims and interests of the nation.

Under the provision of Chapter III of the General Regulations for Primary Schools and the Regulations for Private Secondary Schools (*colegios*), the latter must report their existence to the Ministry of Education and furnish any information needed for a proper appreciation of their operation. In addition to these requirements, school premises must meet certain standards of safety and hygiene and must be equipped with such teaching facilities as textbooks, instructional material, laboratories, playgrounds, libraries, etc. Private schools must use the official curricula and syllabuses and accept the technical supervision of the Ministry of Education. The secondary *colegios* must present their pupils for examinations before official boards and must conform to the recognized standards in regard to marking, examinations and promotions. Primary, secondary and technical-vocational schools providing free education are entitled to an annual subvention equivalent to 50 per cent of the annual cost of maintaining a pupil in the corresponding state schools (Law No. 9864 of January 1951). Fee-paying secondary *colegios* are entitled to an annual subvention equivalent to 25 per cent of the average cost per pupil in state secondary schools (Article 104 of Law No. 10343).

Private universities are subject to the provisions of the Organic Statute of the University of Chile, Article 45 of which stipulates: 'Private university establishments may organize their educational services as they think fit. But instruction leading to degrees or diplomas conferred by the State University shall conform to the curricula and syllabuses approved by the university council for the faculties of that university'. The equivalence of some professional diplomas granted by recognized private universities with those conferred by the (State) University of Chile has been established under subsequent laws. They include the diplomas of state teacher, civil engineer, architect, bachelor of laws and agricultural expert.

Factors affecting the provision of education

The population of Chile may be described as homogeneous. The aboriginal population, which is gradually being assimilated, today forms barely 2 per cent of the total. Because of the ethnic unity of the nation there is also cultural and linguistic unity, and this has encouraged the development of an educational system that is uniform in all its aspects, whether of aims and content or of organization.

The existence of economically weaker groups and the persistence of barriers to social mobility have led to the development of two types of primary education, provided respectively in common primary schools (*escuelas primarias comunes*) and primary departments attached to *liceos*. These factors also explain the existence of two types of secondary education: a general secondary education for pupils who hope to go on to the university; and a technical-vocational education, provided by vocational continuation classes (*cuarto grado vocacional*) in primary schools, the commercial, agricultural and industrial schools and the technical schools for girls, for pupils whose education normally ends in these establishments.

These same factors also account for the existence of a system of private fee-paying education side by side with the system of free state schools financed from public funds, from the pre-primary to the university level. Private education has developed extensively, especially at the secondary and higher levels. Most private *colegios* are financed by the Catholic church through its congregations.

THE DEVELOPMENT OF SECONDARY EDUCATION

By the end of the nineteenth century two parallel types of post-primary education were already established: one of a general nature, represented by the *liceo*, the other of a technical and vocational nature and represented by various kinds of school.

Liceos originated in the National Institute, which was set up in 1813, and until the latter part of the nineteenth century they developed along the lines of the French *lycée*.

When the University of Chile was founded in 1842 the functions of the Superintendency of Education were delegated to the Rector and the University Council, and the *liceos* then came directly under the university's Faculty of Philosophy and Humanistic Studies. From this time on secondary education acquired a form of its own, and with the promulgation in 1879 of the Law on Secondary and Higher Education it became even more closely linked with higher education.

Under this law private secondary *liceos* and *colegios* were placed under the authority of the Council of Public Education (Consejo de Instrucción Pública), which acted as the Superintendency of Education, though they continued to be directly responsible to the Faculty of Philosophy and Humanistic Studies of the University of Chile.

In 1880 the aims, organization and teaching methods of the *liceos* began to come in for criticism, which culminated in 1889 in a reform of the curricula. Under this reform a concentric plan of studies was adopted in place of the system of successive courses followed until that time. The first curricula, drawn up in 1893, were based on the ideas

and recommendations which had led to the reform. At this same time a school of higher education, the Instituto Pedagógico, was established at the University of Chile for the training of secondary teachers, and new organizational and teaching methods were tried out there with the help of German teachers specially recruited for the purpose.

With the adoption of the concentric plan the studies pursued at the *liceos*, which until then had been dominated by the idea of a general cultural education without any form of practical training, were greatly enriched by the addition of technical subjects. On the arts side emphasis was placed on the teaching of Spanish and modern foreign languages, while the science side acquired greater importance. The simultaneous organization of the separate branches through the 6-year course afforded the studies considerable consistency.

Nevertheless the Chilean *liceo* came in for further criticism at the General Congress on Public Education (Congreso General de Enseñanza Pública) held in 1902 and changes were suggested which culminated in the National Congress of Secondary Education (Congreso Nacional de Enseñanza Secundaria) in 1912. It was at this time of great educational activity that were propounded the fundamental problems which still preoccupy the Chilean nation. These are: (a) the need to free secondary education from the influence of German teaching methods and to give it a direction and content more in keeping with the national situation; (b) the need to revise the exclusively humanistic objectives of the *liceo*, hitherto regarded as a selective school concerned solely with preparing students for admission to the university; (c) the need to determine the place of the *liceo*, as a school of general education, in relation to establishments of a technical or vocational nature; (d) the desirability of broadening the aims of the *liceo* so that, as well as preparing students for professional studies, it shall also develop their general intelligence and character; (e) the need to supplement the acquisition of theoretical knowledge by its application in practice; (f) the need to establish continuity of study between primary and secondary education and between both of these and technical education; and (g) the advisability of introducing some elasticity into the curriculum, so as to allow for individual differences.

With the object of making the secondary school less closely dependent on the university, and of ensuring that it should not be directed solely to preparing students for the liberal professions, the Directorate-General of Secondary Education was set up in 1927 as a part of the Ministry of Education and took over the administration of this branch of education.

In 1928 a curriculum divided into two cycles was tried out in the *liceos*; the first cycle (3 years) was common to all, and the second (also 3 years) had three parallel sections (humanistic, scientific and technical). Technical *liceos* were also set up, providing specialized vocational instruction from the first year of studies.

For various reasons this reform was suspended before the end of the year. But a year later new proposals for a secondary education, adapted to social requirements and to the interests, needs and abilities of the adolescents, were formulated in Decree No. 22 of 8 January 1929.

This decree set forth the aims of secondary education,

GLOSSARY

auxiliar de campo especializado: see *escuela agrícola.*

enseñanza media: secondary education.

escuela agrícola: vocational secondary school of agriculture with courses at two levels (*grados*), the lower course comprising two cycles (*ciclos*). The first cycle of the lower course plus a third year of specialized training leads to qualification as specialized agricultural assistant (*auxiliar de campo especializado*); the second cycle plus a third year to qualification as specialized agricultural worker (*práctico agrícola especializado*); the upper course trains agricultural technicians (*técnicos agrícolas*).

escuela consolidada: consolidated, central school with complete primary course and the first cycle of secondary general and technical education (I° *ciclo enseñanza media*).

escuela de párvulos (infant school): pre-primary school.

escuela especial: primary school for handicapped children.

escuela experimental: experimental primary school.

escuela granja (farm school): complete rural primary school with curriculum adapted to needs of rural children and with extensive grounds for practical work in agriculture.

escuela hogar: primary boarding school, intended mainly for needy children.

escuela industrial: vocational secondary school providing technical training for industrial occupations (*grado de oficios*). Students may take specialized courses (*especialización*) after two or four years' study.

escuela normal: teacher training school.

escuela primaria de primera clase: complete (lit. 'first class') primary school, sometimes having continuation vocational classes (*grado vocacional*).

escuela primaria de segunda clase: incomplete (lit. 'second class') primary school.

escuela primaria de tercera clase: incomplete (lit.'third class') primary school.

escuela técnica femenina: vocational secondary school for girls.

escuela vocacional: vocational training school equivalent to the *grado vocacional* of the primary school (see: *escuela primaria de primera clase*).

especialización: specialization (*esp. práctica:* see *instituto de comercio*).

grado de oficios: see *escuelas industriales.*

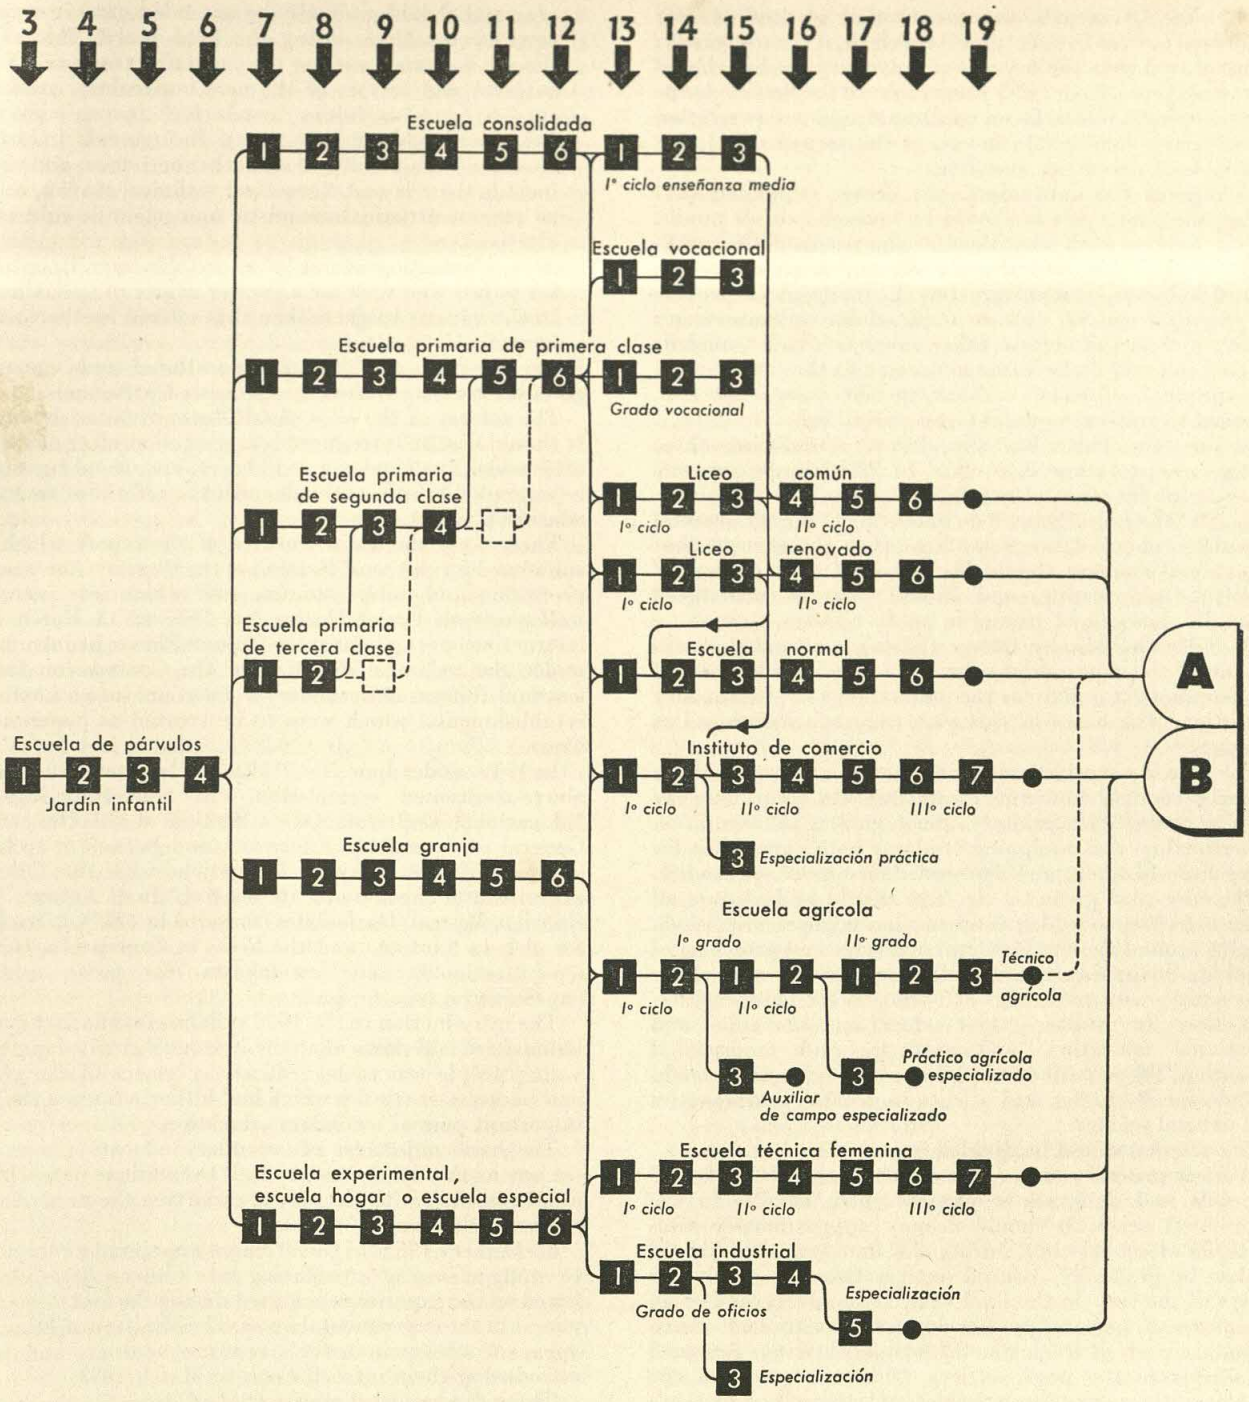
grado vocacional: see *escuela primaria de primera clase.*

instituto de comercio: secondary vocational school of commerce with courses organized in three cycles (*ciclos*); on completing the first cycle students may take a specialized (terminal) year of practical studies (*especialización práctica*).

jardín infantil (kindergarten): pre-primary school.

liceo común: general secondary school of traditional type.

liceo renovado: general secondary school of modern type with a more flexible curriculum than the *liceo común.*



práctico agrícola especializado: see *escuela agrícola.*

técnico agrícola: see *escuela agrícola.*

HIGHER EDUCATION

A. *Universidad:* university.

B. *Universidad técnica:* technical university, and
Instituto pedagógico técnico: specialized training college for teachers of technological subjects.

which were to include the preparation of students for specialized studies in vocational schools or at the university. It also stated that the 6 years of secondary studies should be divided into 2 cycles of 3 years each. In the first cycle the major emphasis was to be on vocational guidance in relation to secondary vocational schools, in the second in relation to schools of university standing.

As regards the curriculum, the decree stipulated that during the first cycle it should be common to all pupils, subject only to such variations as the needs of the pupils might require. The second cycle was to include a common core of subjects, compulsory for all, designed to provide the essential general culture required for any university career; a choice of certain other subjects which would be stressed in order to facilitate admission to the universities; and optional subjects, without specific vocational aim, designed to cultivate special tastes or aptitudes.

Despite the fact that the decree introducing these changes was to come into effect in 1929, conditions were not yet ripe for its implementation.

In 1932 the Liceo Manuel de Salas, the first experimental secondary school, was set up. Since then the concept that educational changes should be subjected to a process of criticism, and testing, and should only be introduced gradually, has gained ground in public opinion.

On 5 March 1945, by Decree 1036(a), a commission was appointed to prepare and submit for the consideration of the Government a plan for the gradual reform of secondary education. The bases of this plan may be summarized as follows:

The *liceo* is conceived as an institution which provides a typical secondary education for adolescents, continuing the training given by the primary school, guiding the formation of personality and equipping students with experience for living and with the knowledge needed for specialized studies.

The education given by the *liceo* should be based on all those activities in which modern man engages and which revolve around the fundamental processes and problems of social life. It should aim at the all-round development of the personality, with particular attention to six main sectors: education for health, social education, economic and vocational education, and aesthetic and recreational education. The scientific and philosophical education should include social studies and science in general, mathematics and natural science.

The studies should be divided into:

1. A basic general course (*plan común*), compulsory for all pupils and designed to prepare them for life in the broadest sense. It should occupy approximately two-thirds of school time during the first year and should then be gradually reduced until it takes up a third or less of the time in the final year. It should cover the six sectors of personality development mentioned above and, in each of them, should include activities designed to provide the pupil with a minimum quota of the information, experience, habits and attitudes which are essential to equip him for life in society.
2. A 'variable' course (*plan variable*), also compulsory, designed to allow of the adaptation of education to individual differences, to discover and develop vocations and to provide specialized training. It should occupy approximately one-third of school time during the first year and should gradually be extended until it occupies most of the time during the final years. This course should contain, within the overall structure of the subjects and sectors of the core curriculum, groups of studies and activities conducive to specialization (whether rapid or long-term), in manual, industrial, commercial, agricultural and other activities, and should include the relevant theoretical technical studies, as well as various artistic, humanistic and scientific subjects as electives.
3. A supplementary course (*plan complementario*), optional, for pupils who wish for a greater degree of specialization in the various subjects than that offered by the variable course.

Every *liceo* should have an educational and vocational guidance service, staffed by specialized personnel.

The reform of the *liceo* should be carried out by stages. It should first be introduced into a small number of schools, after which the curricula, syllabuses, etc., should gradually be extended to other schools until the reform of secondary education is complete.

These were the main features of the report which was submitted for the consideration of the Ministry, the teaching profession and public opinion, and which was extremely well received. Under Decree No. 1687 of 13 March 1946, instructions were given for the Reform Plan to be introduced, under the technical direction of the Commission for the Gradual Reform of Secondary Education, into a number of establishments, which were to be treated as experimental *liceos*.

In 1949, under Law No. 9320, Article 3 (provisional), the above-mentioned commission was converted into the Educational Experimentation Section of the Directorate-General of Secondary Education and became a technical organ of the Ministry of Education, with the following experimental *liceos* under its control: Juan Antonio Ríos, Gabriela Mistral, Darío Sálas (founded in 1947), Liceo No. 6 for girls in Santiago and the *liceos* at Concepción, Quilpué (co-educational) and Antofagasta (for girls), and the experimental *liceo* for girls.

The introduction to the 1952 syllabus for the first cycle of humanities laid down that the harmonious development of young people was to be realized by means of the general and humanistic studies which had hitherto formed the most important part of secondary education.

The basic objectives of secondary education were thus set out as the development of all the various potentialities of adolescents, with the aim of satisfying the needs both of the individual and of society.

In January 1953 the Government appointed a commission to study means of introducing into Chilean *liceos* changes based on the experience acquired during the first 7-year trial period in the experimental *liceos*. The Ministry of Education approved the commission's recommendations and began introducing them into all *liceos* in March 1953.

Three fundamental aims were laid down for the *liceos* in the reform plan submitted by the commission: preparation for democracy, all-round development of the personality, and preparation for earning a living.

The changes introduced into Chilean *liceos* in 1953 comprised the establishment of 1 hour of class council (*consejo de curso*), for purposes of educational guidance;

the introduction of 3 hours of the 'variable' course in the third year of humanities, to bring out the pupil's special aptitudes and interests and to provide a practical pre-vocational training for pupils not continuing with their studies; the establishment of specialization (*diferenciados*) courses in letters, biology and mathematics for pupils in the sixth year of humanities, to provide them with a systematic preparation for higher university studies; the organization of classes by subjects in the *liceos*, the introduction of a new system of marking, examinations and promotions; and the establishment of guidance services.

Technical and vocational education. In the early twentieth century, secondary technical or vocational education was provided by the following types of school which, except for those specifically mentioned, came under the Ministry of Industry and Public Works:

Practical agricultural schools, set up in 1885.

Handwork centres, which came under the Inspectorate-General of Primary Education. These centres worked to a plan promulgated by Decree No. 5222 of 23 October 1907, and offered a 2-year course following on from the sixth year of primary school. When the Law on Compulsory Primary Education was passed, in 1920, the centres were turned into vocational continuation schools (fourth stage of the primary school[1]).

Schools or workshops for girls, which were first established in 1875 and, after 1900, were renamed vocational schools for girls.

Trades schools, founded in 1850 by the Faculty of Philosophy and Humanistic Studies in co-operation with the municipalities.

Industrial schools, the first of which, the School of Arts and Crafts in Santiago, was opened in 1849.

Schools of Mining, the first of which was founded in the town of Copiapó in 1858, based on the courses of mineralogy which for the previous 20 years had been given in the *liceo* of that town.

Commercial institutes, begun in 1898 and including the Technical Commercial Institute coming under the Ministry of Education.

All these establishments, set up in different forms under different bodies, were gradually taken over by the Ministry of Education and, from 1942, by the Directorate-General of Vocational Education established by Decree No. 6/4817.

Technical vocational education, which developed slowly in relation to general secondary education, has expanded rapidly in the past 60 years to meet the new economic needs of the nation. It is also to be noted that vocational training has been broadened through the gradual introduction of cultural subjects and now provides a fuller education for the pupils. At the same time the importance of vocational exploration in the first year is now accepted as a necessary preliminary to the selection of a professional specialization. In addition, it is worth pointing out that this branch of education, which in the early years developed disjointedly and without reference to other branches, now tends to form an integral part of the school system. Its first connexion was with primary education, for which it served as a continuation school. Later, it was linked up with secondary education, thus providing pupils with the opportunity of continuing their studies at various levels. Lastly, the creation of the State Technical University, in 1952, completed the process of incorporating vocational education in the national educational system.

1. The ordinary 6-year primary course is divided into three stages (*grados*) of 2 years each.

Legal basis

The following are some of the main laws and regulations governing secondary education:

Decree No. 22 of 8 January 1929 on the aims and objectives of secondary education.

Decree No. 3409 of 31 May 1935 approving the objectives of secondary education and the curricula for the first and second cycles of the *liceos*.

Decree No. 3865 of 31 July 1941 laying down rules for the approval of textbooks used in secondary schools.

Decree No. 2943 of 26 May 1944 approving the general regulations for *liceos* (*Reglamento General de Liceos*).

Decree No. 8473 of 2 October 1951 approving new syllabuses for the first cycle (first, second and third year of humanities) and determining the aims and objectives of the general secondary schools (amending Decree No. 3409 of 31 May 1935).

Decree No. 75 of 12 January 1955 approving the curriculum of the country's secondary schools.

Decree No. 10000 of 13 September 1956 regulating sports in secondary schools.

Decree No. 1336 of 17 February 1949 governing the vocational guidance service in secondary schools.

Decree No. 842 of 4 February 1959 approving the regulations on marking, examinations and promotion for secondary school pupils.

Decree No. 6016 of 25 June 1959 amending Decree No. 842 of 4 February 1959.

Commercial education. Decree No. 2397 of 27 April 1954 approving the curricula for commercial education courses and establishments (subsequently amended by Decree No. 5814 of 27 December 1958).

Decree No. 2892 of 11 May 1954 approving the curricula for commercial evening courses.

Technical education for girls. Decree No. 770 of 3 March 1955 approving the curriculum of technical educational establishments for girls.

Agricultural education. Decree No. 2806 of 10 May 1954 approving curricula for agricultural education courses and establishments (first stage and third year of specialization).

Decree No. 2954 of 22 April 1957 approving the general agricultural training curriculum for the third year of specialization.

Decree No. 2560 of 25 May 1956 approving the curriculum for the second stage in agricultural schools.

Decree No. 9106 of 13 October 1954 approving the curriculum for agricultural schools for girls.

Industrial education. Decree No. 3120 of 30 April 1957 approving the curriculum for the first course in industrial schools.

Vocational continuation education. Decree No. 9226 of 16 September 1948 approving the curriculum for primary education and its fourth stage (vocational training).

The application of the Law on Compulsory Primary Education, through which general primary education lasting for 6 years has become universal, has had the following effects on the expansion and diversification of secondary education:

1. The preparatory sections of *liceos*, which formerly offered 4-year courses, now work on a 6-year plan and are called *escuelas primarias anexas* (primary departments attached to secondary schools).
2. Before the above-mentioned law was passed, primary pupils who had completed their sixth year used to have to pass a special examination before they could start on their first year of humanities, thus losing two years' seniority; now they are on the same footing as pupils of the *escuelas primarias anexas*.
3. Primary school children now have many more opportunities of continuing their studies.
4. There are more secondary schools and the financial and social background of the pupils is now more diverse.
5. There has been a growing diversification of vocational and technical education and a greater flexibility in the secondary schools curricula, conducive to vocational exploration, the cultivating and developing of special aptitudes and interests, and specialized preparation for higher studies. Hand in hand with this has gone the introduction of educational and vocational guidance services.

Administration

Power to determine the structure and general operational norms of secondary education, and of all the departments of the Ministry of Education, is vested in the National Congress, which occasionally delegates that power to the Executive. In virtue of the functions assigned to the President of the Republic by the Constitution (Article 60), the Executive, consisting in this case of the President of the Republic and the Minister of Education, approves the decrees laying down the standards governing the organization and internal operation of the Directorates-General concerned and the establishments coming under them.

In performing this function the Executive is advised by the Directorate-General concerned and by the Superintendency of Education.

In compliance with existing statutory provisions, the Directorate-General of Secondary Education is responsible for the technical and administrative direction of secondary education. It carries out these duties through the Administrative Department, the Pedagogical Department, the Inspectorate-General (*Visitación General*) and the relevant sections.

The Administrative Department comprises the following bodies: the Secretariat-General, which is a general administration office responsible for facilitating the handling and internal transmission of all matters of which the Directorate-General or the bodies coming immediately under it must be aware or on which they must take action; the Personnel Section (*Sección Escalafón y Propuestas*), which is responsible for everything connected with personnel movements (proposals for appointments, transfers, exchanges, dismissals, etc.) and the Examinations and Private Secondary Schools Section, which is responsible for the control of examinations and promotion of pupils in secondary schools, both State and private.

A commission, presided over by the Director-General and consisting of one official representing the Minister and two appointed by the Director-General from among the supervisory officials, investigates applications for appointment to the service and puts forward the names of three candidates from among whom the Minister makes a final selection.

The Pedagogical Department comprises the Technical Section (*Sección Técnica y de Orientación*) which is in general charge of the technical work of teaching and the educational and vocational line followed by general secondary schools, and the In-Service Training and Experimentation Section (*Sección de Perfeccionamiento y Experimentación*) which is responsible for improving teaching standards, for controlling all aspects of the experimental secondary schools and for making known the results of the experiments carried out in those establishments.

The Inspectorate-General consists of four inspectors responsible respectively for the humanities, sciences, technical subjects and the primary departments of secondary schools (*escuelas anexas*). Each inspector is responsible for personnel administration and the supervision of instructional methods in his particular group of subjects.

The Directorate-General also has 10 educational advisers on the various subjects. They are attached to the In-Service Training Section and are responsible for preparing syllabuses, textbooks and educational material for the experimental secondary schools and for supervising the teaching given in both experimental and general secondary schools.

A technical council, presided over by the Director-General and composed of the heads of all departments and sections and the inspectors-general, advises the Director-General on all matters concerning curricula and syllabuses, the organization and functioning of the *liceos*, standards for marking, examinations and promotion and, in general, all problems affecting the operation of the service.

Under current legislation the Directorate-General of Agricultural, Commercial and Technical Education is responsible for the technical and administrative direction of the vocational education service.

The functions of this directorate are carried out through the following organs: the departments responsible for the technical and pedagogical direction of agricultural, commercial and industrial education and of technical education for girls; the Administrative Department, which controls the establishments and personnel coming under the Directorate-General and which consists of the Personnel Section (*Sección Escalafón, Propuestas y Resoluciones*) and the Degrees and Diplomas, Examinations and Private Secondary Schools Section (*Sección Títulos y Grados y Exámenes y Colegios Particulares*); and the Pedagogical Inspectorate (*Visitación Pedagógica*) which is responsible for studying, in co-operation with the departments concerned, the curricula, syllabuses, textbooks and other aspects of the various schools and establishments.

The Secretariat-General is a general administrative office which fulfils the same functions as the Secretariat-General of the Directorate-General of Secondary Education.

Control. The control of secondary schools, both general and vocational, is a responsibility of the Ministry of Education and is exercised through the Directorate-General concerned and the principals of schools. At the same time, all administrative acts of the Ministry are subject to control by the Department of the Comptroller-General of the Republic (*Contraloría General de la República*), which is responsible for examining the legality of decrees issued by the executive on matters which require approval by decree (personnel appointments, transfers, exchanges and leave; changes in curricula and syllabuses; and payment of moneys under the operating budget of the Ministry of Education, in accordance with the relevant laws and regulations.

The principal of each school is in charge of all the school's activities and directly responsible for its operation.

Supervision and inspection. Supervisory functions in secondary education are exercised by the Directorates-General, the Inspectors-General, the heads of the Pedagogical Departments and Technical Sections and the Educational Advisers. In educational establishments such functions are performed by the respective principals and, in the case of agricultural, commercial and technical schools and institutes, by the heads on the educational and technical sides. All these officials must hold the diploma of state teacher, engineer or technician in their particular subjects, according to the provisions of the Statute of the Teaching Profession (Article 10), and must have a certain number of years' service, varying from 3 to 15 years according to the case (Article 49 of the same statute).

As regards grading, the principals of establishments may not be promoted to higher office unless they qualify for inclusion in List 1 (of merit).

Finance. State education is financed from funds derived from the sources listed below:

1. The Ministry of Education, chapter of the national budget.
2. The Fund for the Building and Equipment of Public Educational Establishments (Law No. 11766 of 24 December 1954).[1]
3. The funds derived from various items of the national budget, in accordance with Law No. 7869 which established the Society for the Construction of School Buildings and provided that the Treasury should acquire shares in it. These funds come from the balances of fiscal resources not reserved for other specific purposes by special laws, from income derived from the tax on bequests and donations, and from other sources.
4. The funds of the National Committee for Assistance to Schools and of the provincial and local Committees for Assistance to Schools. Apart from the moneys specifically set aside for this purpose in the national budget, the funds are made up of contributions from the municipalities and the Social Security Service, of legacies, donations and gifts, and of other resources.
5. Enrolment fees and contributions towards the cost of materials used in the handwork and domestic economy classes of secondary schools.
6. The income derived by secondary vocational schools from the sale of articles made by the pupils.
7. The funds derived under Law No. 11575 (Article 36) of 14 August 1954, which allocates, for a period of 20 years starting from 1 January 1956, 0,5 per cent of all direct and indirect fiscal taxes and customs and export dues, for buildings and scientific research.
8. Ten per cent of the income derived from the taxes levied on the major copper producing concerns is allocated under Law No. 11818 (Article 27) of 5 May 1955 to the State Technical University and the Austral University.

A part of the budgetary resources of the Ministry of Education is used for the payment of subventions to private secondary schools, in accordance with Law No. 9864 of 25 January 1951 granting a subvention for each pupil attending non-fee paying private secondary education establishments and of Article 104 of Law No. 10343 granting subventions to fee-paying private secondary schools.

Schools are also maintained by the municipalities from their own funds (in an amount of 5 per cent of their budget).

Funds to be used for the payment of the staffs of educational establishments are allocated by the Annual Law on the Budget. Funds for the lease of land or buildings, for maintenance and repairs, educational material and school equipment, general office expenses, libraries, in-service training courses and other variable expenses are included in the budget in global form and are allocated by the Directorate-General concerned through decrees issued by the Ministry of Education.

School buildings and equipment are financed by the Ministry of Education through the Society for the Construction of School Buildings and the Fund for the Building and Equipment of Public Educational Establishments.

In addition, the construction of some school buildings is financed by the Ministry of Public Works.

Buildings and equipment. The standards governing school buildings and equipment are laid down by the Premises, Furniture and Materials Section of the Ministry of Public Education, the Society for the Construction of School Buildings, the Ministry of Health and the Municipalities.

School welfare services. A number of schools have welfare services providing medical, dental and social care for the pupils. The welfare work covers boarding arrangements, food, clothing, scholarships, school holiday camps and rest centres.

Contributions towards the maintenance of these services are made by the Social Welfare Department of the Ministry of Education, the National Health Service, the School Welfare Funds (Rentas de Auxilio Escolar) and parents' associations.

1. This fund is made up of contributions from the municipalities and private persons and from various taxes: 0.25 per cent on the salaries or remuneration received by advisers to public, semi-public or independent institutions and joint-stock companies; 0.75 per cent on the salaries of employees and workers, payable by the chief or employer, etc.

TYPES OF SECONDARY EDUCATION

On completing his primary school proper (6 years of study), a pupil now has the choice of two major types of secondary education: general secondary education, and specialized

vocational or professional secondary education. These two types of education are usually provided by separate schools: the secondary *liceos* and *colegios* which offer a general humanistic, scientific and technical education with no specific vocational aim; and schools or institutes which prepare their students for work in agriculture, commerce or industry. Some establishments also combine a general education with pre-vocational or professional training—as, for instance, the experimental *liceos* and the consolidated schools, whose secondary cycle includes commercial and technical subjects as well as academic studies.

General education is provided in both full-time and part-time schools.

Educational and vocational guidance for primary school pupils is given by the class teachers under the supervision of guidance specialists maintained by the Directorate-General of Primary Education in all provincial and local directorates of education. These officials are directed and supervised by a technical adviser on vocational guidance from the same Directorate-General. Such guidance includes the provision of information to pupils and parents on the various educational opportunities available on completion of primary schooling, interviewing pupils, activities designed to discover the interests and aptitudes of pupils through specialized courses of vocational education, advice on educational and vocational matters, and the following up of all this.

In secondary schools, the school year begins on the first Monday in March and ends on 24 December. Secondary schools are open for 235 working days a year, and this represents the working year for teachers; the school year for pupils consists of 225 days. Secondary schools are open every day from Monday to Saturday. During the school year there are 10 public holidays, 1 week in September to celebrate the national holiday, and a winter holiday of 2 or 3 weeks in July.

A normal day in a full-time school varies between 6 and 8 classes. The number of hours worked each week in general secondary schools varies from 31 to 37 and in technical vocational schools from 36 to 43.

General secondary schools

The aim of the *liceos* is to provide adolescents with a moral, intellectual, aesthetic, vocational and physical training designed to ensure the all-round development of their personalities and to prepare them for life in a democratic society and for earning their living.

Secondary education lasts for 6 years and is divided into two cycles of 3 years each.

To be admitted to the first year of humanities, a pupil must be at least 11 (eleventh birthday in the course of the school year) and must not be more than 15 years old; he must have satisfactorily completed the sixth year of primary schooling and must have passed the entrance examination for which candidates are required to sit when there are not enough places available (this examination includes Spanish and mathematics).

When the number of first-year pupils allows, parallel classes are formed and the opportunity is taken to form groups that are homogeneous from the point of view both of age and of the stage of advancement reached. This also applies to the other classes.

The curriculum comprises: (a) Subjects compulsory for all pupils: Spanish, history and geography, philosophy (5th and 6th year), civics, a language of Latin origin (French, Italian, Latin or Portuguese), English or German, mathematics, science, physics and chemistry, visual arts, handwork for (boys), domestic economy for (girls), music and physical education. One hour of class council (*consejo de curso*) is also included. (b) A group of subjects from which one or two must be chosen and which forms the variable course for the third year of humanities. Religious instruction is optional and is only available during the first cycle. (c) Subjects in the specialization course on either the arts or the science side, taken during the 6th year. These specialization courses take up approximately half the weekly time-table and pupils must opt for one of them (see curriculum below).

The reformed and experimental *liceos* have curricula similar to the foregoing but they devote more time to educational guidance activities, the variable course, the specialization course (4th, 5th and 6th year), the optional subjects and, in general, to educational activities aimed at providing guidance and social training for the student.

In all *liceos*, the progress of pupils is appraised not only on the basis of their performance in the various subjects

TIME-TABLE FOR GENERAL SECONDARY SCHOOLS
(in periods per week)

but also in regard to the growth of their personality. For this purpose the school year is divided into three terms. At the end of each term marks are awarded and are communicated to the pupils' parents or guardians. For these end-of-term appraisals, as for the end-of-year examinations, practical tests and oral questions are used whenever necessary. Encouragement is given to work throughout the year by assigning to it a coefficient equal to 60 per cent, as against 40 per cent for the end-of-year examination.

At the end of the sixth year of humanities, a secondary school leaving certificate is granted by the Directorate-General of Secondary Education. Pupils wishing to sit for the *Bachillerato en Humanidades* examination must hold this certificate.

Vocational and technical schools

Commercial institutes. These schools, the aim of which is to train technicians for the various branches of trade, offer a 7-year course of studies divided into three cycles of 2, 3 and 2 years respectively.

To be admitted to the first year of these schools, pupils must have completed the 6 years of primary schooling, must be at least 12 and not more than 17 years of age at the time of enrolment, must be physically fit to undertake the studies involved and must pass an entrance examination. General secondary school pupils may join other courses of the commercial institutes, after taking an entrance examination, in the following conditions: (a) students who have completed the first, second or third year of humanities may join, respectively, the second, third or fourth year of special commercial studies; (b) students who have completed 6 years of humanities may join the preliminary course for the third cycle.[1]

At the end of the second cycle students receive the diploma of commercial studies, and at the end of the third cycle the certificates of accountant, company secretary or commercial representative.

The first cycle covers not only vocational subjects (business correspondence, commercial mathematics, elements of commercial practice, book-keeping, typewriting and commercial products) but also such general subjects as Spanish, English, history and geography, natural sciences, penmanship, drawing, physical education, music, domestic economy (for girls) and handwork (for boys). One hour a week is devoted to class council. At the end of this cycle those students who do not wish to continue regular studies can take a 1-year specialization course leading to the diploma of assistant clerk, assistant secretary or assistant salesman.

In addition to class council and some general subjects (Spanish, English, physics, psychology, human biology and hygiene, physical education and music), the second cycle covers such professional subjects as commercial practice, statistics, chemistry, merchandizing, customary law, fiscal laws, customs procedure, foreign trade, etc. At the end of this cycle students move on to more specialized studies.

1. The aim of the special courses and of the preliminary course for the third cycle is to help pupils from the general secondary schools to transfer to commercial schools by providing specially adapted courses which will enable them to catch up in the various subjects without much loss of time.

In the third cycle the general cultural subjects include social and cultural problems and English. A few subjects of general professional interest are studied but most of the time is given over to specialized training for the following professions:

Accountants. The subjects studied include financial mathematics, higher accountancy, the preparation and organization of systems of accounting, business organization, foreign trade, commercial policy, etc.

Company secretaries. Drafting, shorthand-typing, office organization and administration, general psychology and the psychology of advertising, customary law practice, etc.

Commercial representatives. Merchandizing, sales psychology, transport, market surveys, credit and banking, fiscal legislation, etc.

Graduates of the commercial institutes may sit for the *Bachillerato en Economía*, which qualifies them for admission to the School of Economics and Commerce of the University of Chile.

Vocational schools for boys. The aims of these schools are: (a) to offer fifth- and sixth-year primary school pupils the opportunity of discovering their vocations, and (b) to provide elementary training in crafts and industrial techniques. Instruction is based on a 3-year curriculum.

Boys wishing to take up vocational training proper must be at least 15 years of age and must have completed the sixth year of primary schooling. A certificate of proficiency is given at the end of the course.

Industrial schools. The purpose of industrial schools is to train operatives for industry. Instruction is based on a Grade I curriculum of 5 years divided into two cycles lasting for 2 and 3 years respectively.

At the end of the second year pupils who do not wish to continue with the second cycle take a third year of specialization.

Qualifications for admission to the first year are the same as in the commercial institutes. Pupils who have completed 2 years of humanities (subject to passing an entrance examination), and pupils who have completed 3 years of humanities, may join a preliminary course for the third year of industrial training which is designed to enable them to catch up in technical sujects so that they can continue with the regular second-cycle studies.

At the end of the third year of specialization, pupils receive the Certificate of Trained Operative (first cycle), in the speciality concerned.

Fifth year graduates with at least 1 year's practical professional experience are granted the Certificate of Trained Operative (second cycle), in the speciality concerned.

In addition to various general cultural subjects (Spanish, social studies, mathematics, a foreign language, general science, physical education and music), the first cycle instruction includes such professional subjects as free-hand drawing, technical drawing, the technology of materials and intensive workshop experience. This practical work takes up approximately half the weekly time-table in the first and second year classes. In the third year of specialization, three-quarters of the time is given over to technology and practical work and the remainder to such subjects as civics, social legislation, and health and safety in industry.

In the second cycle, instruction is divided between a general course and a specialization course. The former includes Spanish, social studies, mathematics, a foreign language, physics, chemistry and physical education and such basic vocational subjects as health and safety in industry and social legislation. The specialization course includes theoretical and practical instruction in workshops and branches of the speciality selected by the pupil. The specialization course takes up about 50 per cent of the weekly time-table in the third year and about 60 per cent in the fourth and fifth years.

As regards appraisal and examinations, the same system applies as in the case of commercial schools.

Fifth year graduates (Grade I) may take the *Bachillerato Industrial*, which entitles them to continue their studies at the State Technical University.

The industrial schools provide instruction in various specialities and train industrial mechanics, motor mechanics, agricultural mechanics, moulders, forestry mechanics, electricians, cabinet-makers, ship-builders, foundrymen, plumbers, weavers, pattern-makers, skippers of fishing-boats, tailors, etc.

Vocational schools for girls. The aim of these schools is to offer fifth- and sixth-year primary school pupils opportunities of acquiring elementary professional skills. The course lasts for 3 years and, on completing it, the girls are qualified to work as specialized operatives. The conditions for admission to these schools are the same as for the vocational schools for boys.

Technical schools for girls. These schools are intended to train girls for technical professions appropriate to their sex, to give them a general physical, intellectual and moral education, and to prepare them for life in the home and society.

They provide a 5-year course of study, forming the first stage of technical education for girls, divided into two cycles—the first of 2 and the second of 3 years.

At the end of the first cycle pupils who do not wish to continue with the second cycle may take a third year of specialization.

To be admitted to the first year of these schools, girls must have satisfactorily completed 6 years of primary schooling and must be at least 13 years of age. The conditions governing admission to other courses are as follows: (a) girls who have completed 2 or 3 years of humanities may join the preliminary course, parallel to the second year, and (b) girls who have completed 4 or 5 years of humanities may join the preliminary course for the fifth year.

The first cycle course comprises general subjects—Spanish, mathematics, social studies, general science, physical education, music, drawing and religious instruction (optional)—and the following professional subjects: technical drawing, techniques of the various occupations and workshop practice. There are also class council activities. In the first year the vocational subjects occupy about 40 per cent of the weekly time-table, in the second year about 50 per cent. During the first cycle and the third year of specialization, the girls learn to make hats, flowers, machine-woven fabrics and toys; they also acquire a knowledge of such special branches as tailoring, the making of children's dresses and underwear, pastry-making, hairdressing, upholstery, etc.

In the second cycle the general subjects include Spanish, social studies, mathematics, music, foreign languages, human biology and hygiene, elements of physics and chemistry, psychology and physical education. The vocational subjects include the care of children, social legislation, the industrial administration of workshops, technical drawing, theoretical and practical instruction in workshops, and technical training in the speciality.

Approximately 50 per cent of the weekly time-table is taken up by the vocational subjects in the third year and 70 per cent in the fourth and fith years.

In the second cycle students can learn such trades as dressmaking, lingerie, hand embroidery, weaving, children's dressmaking, machine embroidery, tailoring, domestic economy, pottery making, etc.

At the end of the fifth year, students receive the diploma of forewoman in the speciality concerned.

On completion of the first grade of technical education, girls can continue their studies at the Higher Technical School for Girls, at *ad hoc* training courses for vocational school teachers, or at pre-university courses arranged by the Technical Pedagogical Institute and leading to the diploma of state teacher in the speciality selected.

Agricultural schools. The purpose of these schools is to train farm workers, qualified farmers and agricultural technicians.

They provide a 7-year course of instruction, divided into three cycles of 2 years, 2 years and 3 years respectively.

For admission to the first year of the first cycle, candidates must have completed 6 years of primary schooling and be in a fit state of health to undertake agricultural work. Pupils who have completed two or three years of general secondary education may join a preliminary course, parallel with the second year of the first cycle.

The syllabus of the first cycle includes class council and the following general subjects: Spanish, social studies, mathematics, natural sciences, music, physical education and drawing. The vocational studies include general agriculture, bee-keeping, poultry raising and rabbit breeding, horticulture and gardening, and practical work in the field and workshop.

Pupils who do not wish to go on to the second cycle can take a third year of specialization, at the end of which they receive a certificate of farm worker in the various branches.

Second cycle studies include class council and the following general subjects: Spanish, social studies, English, mathematics, biological sciences, chemistry and physical education. Occupational subjects include fruit growing and plant diseases, oenology and vine growing, cattle breeding and feeding, dairy farming, cattle diseases, agricultural machinery, crops, forestry, soils and fertilizers, and practical work in the fields and workshop. The specialization course, available at the end of the second cycle for students who do not wish to go on to the third cycle, offers training in such varied activities as arboriculture, oenology, cattle raising, etc., and leads to the diploma of qualified farmer.

The third cycle provides an even more intensive training in the theory and practice of farming. At the end of this cycle students receive the diploma of agricultural technician in various branches.

Teacher training schools

Teachers for urban and rural primary schools are trained in teacher training schools (*escuelas normales*) of secondary education level. The course lasts for 6 years and for admission to these schools, students must have completed the sixth year of primary schooling or the second year of humanities (secondary schooling). All candidates for teacher training schools must pass an entrance examination.

Both urban and rural teacher training schools provide 4 years of general education and 2 of professional training.

The general education is divided into the following sectors: physical education; scientific education (including Spanish grammar, mathematics, physics, biological sciences and hygiene, chemistry, social science and general psychology); artistic education (including Spanish literature, singing and music, drawing and modelling); technical education (including penmanship, spelling, handwork, women's occupations, domestic economy, child welfare); and foreign languages.

The professional training given in the 2 final years is divided into two sectors: ancillary science studies and philosophy (including educational biology, educational psychology, educational sociology, school health and an introduction to philosophy); and pedagogy (including instruction in vocational guidance, the principles of education, the technique of teaching, school organization and administration, and the philosophy and history of education). This is rounded off by specialist study of primary teaching and intensive teaching practice.

In addition, throughout the 6-year course, from two to nine periods a week are set aside for optional or supplementary activities.

Other specialized schools

Part-time schools. In addition to the schools already mentioned there are various institutions for general and technical vocational education at secondary level which operates on a half-day basis with slightly changed curricula. These institutions, intended for adult education may be either state or private. They include evening and night secondary schools, evening commercial classes, evening industrial classes, academies or institutes providing technical education for women, etc.

Special state schools coming under the Ministry of Education. These comprise the following institutions, all of which admit pupils who have completed 6 years of primary schooling: the National School of Graphic Arts, the National School of Tailoring, technical schools and technical courses for girls, attached to girl's secondary schools, the Experimental School for Education in the Arts (6 years of general secondary education combined with special instruction in the plastic arts and music), and the School of Stone Masonry.

Educational establishments coming under other state or semi-public bodies not responsible to the Ministry of Education. These schools include technical agricultural schools run by the Ministry of Agriculture, the Practical School of Agriculture attached to the Agricultural Faculty of the University of Chile, the School of Apprentices of the Central Machine Shop of the State Railways, the Carlos Arias Martines Railway Technical Institute, the Post and Telegraph School, the National Airline's Training Centre, the School of Applied Arts (which comes under the Faculty of Science and Plastic Arts of the University of Chile), the National Conservatorium of Music (which comes under the Faculty of Musical Science and Art of the University of Chile and has a secondary studies' section for arts students with musical gifts), the Bernardo O'Higgins Military College, the Arturo Prat Naval College, and the Capitán Avalos School of Aviation, and other training establishments for the armed forces.

Private vocational secondary schools. There are many full-time private vocational schools, some of which follow the official curricula, while others arrange their own courses.

Out-of-school activities

In the general secondary, vocational and technical schools, there are various student institutions like the class council (*consejo de curso*), the pupil members of which form working parties to look after the needs and interests of the group, under the guidance of the head teacher. Student government bodies, with teachers in an advisory capacity, also exist in many such establishments. In a growing number of secondary educational institutions pupils also have the opportunity of joining clubs and co-operatives, and taking part in study trips and various other school projects and festivities.

All educational establishments organize sports and games for pupils of both sexes and there is a highly developed system of school competitions, local, regional and national, for both sexes. Secondary school students have a national organization called the Secondary School Sports Federation of Chile which is under the supervision of the Ministry of Education.

Increasing numbers of secondary schools are giving their pupils the opportunity of participating in such community-service youth organizations as the Boy Scouts, Red Cross and the Traffic Brigades (*Brigadas del Tránsito*) and in elementary education activities for adults.

Secondary school students have an independent national organization called the Federación de Estudiantes Secundarios.

TRENDS AND PROBLEMS

As can be seen from this outline both general and vocational secondary schools are going through a process of re-orientation and change designed to adapt them to the needs, interests and capacities of the pupils and to social needs. Especially in general secondary education, where for some years a group of experimental schools has been disseminating new ideas and teaching practices, changes are to be seen which represent a marked improvement.

Some of the fields in which these changes are most apparent are those relating to educational policy, curricula, teaching programmes and methods, the appraisal of pupils' work, the organization and administration of *colegios*, new forms of school organization and teacher training.

Secondary educational policy has been broadened and the aims now emphasized are preparation for life in a democracy, the full development of personality and preparation for earning a living.

Flexible curricula have been introduced into the general secondary schools, which now offer differentiated curricula during the second cycle and variable curricula in the first cycle. The purpose of the former is to guide the pupils in the choice of a vocation and to prepare them for higher studies in accordance with their bent. The latter make possible a certain pre-vocational exploration and preparation which help the student to fit into working life immediately or continue his studies at a technical-vocational school.

To meet the new needs arising from the country's economic development, vocational schools now offer a wider and more varied range of subjects, while general cultural training has been enriched by the inclusion of new branches of humanistic studies or the intensification of existing ones.

There is a growing concern that school programmes should be better adapted to the individual characteristics of the student and the requirements of society. New secondary school programmes are being drawn up with this aim in view.

Teaching methods tend to be based on the experience of pupils and on the use of visual media, study visits and excursions, group work, and personal investigation and the solution of problems by the pupil.

Progress has also been made in methods of appraising the work of pupils. Growing use is being made of objective tests and the personal development of the pupil is also appraised.

Better social training of pupils is fostered by the introduction of such general activities as class councils, student government, clubs, co-operatives and other forms of social activity.

Related to these changes is the tendency to organize secondary schools on a more functional basis; this encourages co-operation between teachers and the co-ordination of efforts to improve all aspects of the instructional and educational work of secondary schools. This is leading to changes in the traditional procedures and to the adoption of more democratic principles in the internal administration of secondary schools.

The changes in both general secondary and technical vocational education are clearly tending to bring closer together these two types of training, which formerly were provided by entirely separate and exclusive schools. The *liceos*, which provided an almost exclusively academic general education, now teach vocational subjects, while the technical vocational schools, which formerly provided an almost exclusively technical training, now include cultural subjects that enable them to give a more balanced education. Moreover, attempts are being made to embody this trend towards the integration of general and specialized training in a new type of educational establishment, the consolidated school (*escuela consolidada*), in which different types of curricula are offered in the same institution. Also as part of this trend an effort is being made to raise the general educational qualification for admission to specialized schools to 3 years of general secondary studies.

In much the same connexion, the State University, in view of the constant expansion of secondary education and the need for decentralizing higher education, has started university colleges. These institutions offer 2-year study courses linking up with the third year of the university's vocational schools. Their aims are:

To deepen and broaden the students' general education.

To offer students a basic academic preparation, specialized in some field of culture, which will enable them either to study for a profession or, in the case of young people of outstanding ability and a marked vocation to undertake higher studies and research activities leading to a university degree.

To enable persons who do not wish to carry on to the final degree to prepare for semi-qualified posts, according to the needs of the area.

To carry out university extension work catering for the cultural interests not only of the pupils but also of broad sections of the community.

To provide technical assistance to community institutions that apply for it.

To put these changes into effect various steps have been taken in connexion with the initial and further training of teachers. A special institute of university standard—the *Instituto Pedagógico Técnico*—has been set up to train teachers for technical vocational schools. Two new compulsory subjects, educational and vocational guidance and school organization and administration, have been introduced by the Pedagogical Institute of the University of Chile. More practice is given in teaching and the senior masters in charge of particular subjects have been given greater responsibilities. The same Pedagogical Institute also offers a year's post-graduate course for the training of secondary school educational and vocational advisers which has made it possible to introduce guidance services into a large number of secondary schools.

Finally, the fact has been recognized that the principals of secondary schools need special training for their posts. A special post-graduate course has been started for the initial and further training of such senior staff.

STATISTICS

Population (mid-year 1958 estimate): 7,298,000.
Area: 286,397 square miles; 741,767 square kilometres.
Population density: 25 per square mile; 10 per square kilometre.

Summary of school statistics, 1953–57. In 1957, total school enrolment was about 1,310,000 (not including 57,000 adults attending general or vocational courses). As in 1954, the school-going population represented about 18 per cent of the total population. Proportionally, the distribution of the total enrolment was as follows: pre-primary education, 2 per cent; primary education, 80 per cent; secondary education, 15 per cent; higher education, 2 per cent. The proportion of girl pupils was around 50 per cent respectively in pre-primary, primary and secondary education (general, vocational and teacher training). Not including the technical university, the proportion of girl students at the level of higher education was as high as 40 per cent.

Between 1953 and 1957, total school enrolment increased by 20 per cent. Percentage increases by level and type of education are: primary, 20 per cent; general secondary, 43 per cent; secondary vocational, 51 per cent; secondary teacher training, 21 per cent. Most of the increase in vocational school enrolment was due to the private schools, which had 1,875 pupils in 1953 and 12,367 in 1957. (See Table 2.)

Enrolment trends is secondary education, 1930–57. Average enrolment in secondary education tripled between the periods 1932–34 and 1955–57. (See Table 3.) Relative to the population 15–19 years of age, the secondary enrolment ratio more than doubled over the whole period under review. General secondary school enrolment, which accounted for about two-thirds of the total, showed particularly rapid increase in more recent years. The proportion of girls in general secondary education rose from 43 per cent in 1931–32 to 50 per cent or more since 1947, even though for most of the period military schools and police schools were included. On the other hand, the proportion of girls in teacher training schools seems to have declined from the high level in earlier years.

Examination results in secondary education, 1953–57. The number of secondary school certificates granted each year between 1953 and 1957 was as follows: (1953) 6,653; (1954) 6,901; (1955) 7,287; (1956) 6,507; (1957) 7,226. The slight increase (9 per cent) over this period was less than the increase of enrolment during the same period. The proportion of certificates granted to girls was 49 per cent in 1957 as compared with 46 per cent in 1953. The number of teacher training certificates was 1,501 in 1954; 1,254 in 1955; 1,468 in 1956; and 1,295 in 1957. The proportion of girls receiving teacher training certificates dropped from 60 per cent in 1954 to 54 per cent in 1957.

Educational finance, 1957. In the fiscal year beginning in January 1957, total expenditure on education amounted to 46,716 million pesos (see Table 1), being 6,560 pesos per

1. From 1931 to 1954, military schools and police schools are included.
2. Figures referring to schools for adults, to health and social service schools and art schools are included in vocational education, from 1932 to 1954.

CHINA
(Taiwan)

THE EDUCATIONAL SYSTEM

The existing Chinese Government derives its powers from the National Assembly, which held its first session in March 1947, when it passed the Constitution of the Republic of China. The legal basis of the present educational system is to be found in that Constitution, some of the chief relevant articles being:

Article 158. The nation's educational and cultural services shall have as their aim the development among the citizens of a national spirit, democratic ideals, traditional morality, good physique, scientific knowledge, and the ability to earn a living.

Article 159. All citizens shall have an equal opportunity to receive education.

Article 160. All children of school age, namely those from 6 to 12 years, shall receive free primary education. Those from poor families shall be supplied with textbooks at the expense of the Government. All citizens above school age who have not received primary education shall receive supplementary education free of charge and shall likewise be supplied with textbooks at the expense of the Government.

Article 161. The national, provincial, and local governments shall create scholarships to assist students of good scholastic standing and of exemplary conduct who lack the means to continue their school education.

Article 162. All public and private educational and cultural institutions throughout the country shall, in accordance with law, be subject to state supervision.

Article 163. The State shall pay due attention to the balanced development of education in different regions and shall promote social education in order to raise the cultural standard of the people as a whole.

Article 164. Expenditure for educational programmes, scientific studies and cultural services shall, as regards the Central Government, be not less than 15 per cent of the total national budget; in respect of the provinces, not less than 25 per cent of the total provincial budget; and in respect of the municipalities or counties not less than 35 per cent of the total municipal or county budget. Educational and cultural foundations established in accordance with the law shall, together with their property, be protected.

There is also provision (in Article 167) for government aid to approved private educational enterprises both at home and abroad.

Demarcation of powers as between the various levels of government is also defined by the Constitution. Generally speaking, matters that are of a national character fall within the jurisdiction of the Central Government; otherwise, they are delegated to provincial and *hsien* (municipality or county) governments.

The structure of the school system is shown in the diagram on page 361.

THE DEVELOPMENT OF SECONDARY EDUCATION

It was in 1903 that China first adopted a new educational system based on the Western pattern. Three types of schools were established at the secondary level, namely, academic high schools, vocational high schools, and normal (i.e. teacher-training) schools, each offering a 5-year course of study. After the downfall of the Manchu Dynasty in 1911, the Central Government of the new Republic revised the old school system and established secondary schools, both general and vocational, which provided a 4-year curriculum. It was further laid down that over and above the academic high school there should be a 2-year college preparatory course, affiliated with a college or university, which would lay a solid foundation for higher education, and that vocational high schools might retain their fifth year to cater for special needs. In the category of vocational education were included agricultural, industrial, and business and maritime schools.

However, the school system proved too rigid, while a large percentage of the academic high school graduates did not proceed to further studies at colleges or universities. Educational policy was therefore severely criticized, and following upon two national educational conferences, held in 1916 and 1919, drastic changes were made in the whole educational system. The new organization, put into effect in 1922 and still operative, is known as the 6-3-3-plan; it provides a 6-year primary education, a 3-year junior high school, and a 3-year senior high school for pupils of ages 6 to 18. Under this system, the junior high school and the senior high school may be separate or combined. The 4-2 plan (4 years for junior high and 2 years for senior high) or the 2-4 plan (2 years for junior high and 4 years for senior high) instead of the 3-3 plan may be adopted. The reorganization of 1922 introduced provisions whereby the junior academic high school might offer pre-vocational courses in the third year to meet local needs, and the senior academic high school might be of a comprehensive type with a general course plus one or more vocational courses, even including a teacher training course. Furthermore, the general course at senior level was to be differentiated to suit the varying needs and capacities of the pupils. The system was characterized by flexibility rather than uniformity.

Nevertheless, only five years after the establishment of the Nationalist Government at Nanking in 1927 the Ministry of Education abolished the comprehensive type of secondary school, so that the academic high school, the vocational high school and the normal school were again made separate institutions. All subjects in the curriculum of the academic high school were once more made compulsory, with no provision for differentiation or choice.

During the Sino-Japanese war, which broke out in 1937, the only changes in academic high school education were a few modifications in the curriculum. But in the field of vocational secondary education innovations included a

more practical type of course offered by the junior vocational school, the skilled workers' training class providing a period of training of from 1 year to 3 years, the short-term vocational training class with a period of training from 3 months to 1 year, and a 4-year course for training skilled mechanics and electricians, the last year of which was spent in factories.

Since the removal of the Central Government to Taiwan in 1949, secondary education has made rapid progress. Although compulsory school attendance is still limited to the 6 years covering primary (elementary school) education, the number of academic and vocational high schools and enrolments in the schools has steadily increased.

Legal basis

As mentioned in the previous section, the general secondary school, the vocational secondary school, and the normal school have been kept as separate institutions since the abolition of comprehensive high schools in 1932. In the same year the Central Government promulgated three principal laws concerning the different types of secondary education: the Academic High School Education Law, the Vocational High School Education Law, and the Normal School Education Law, each of which lays down certain fundamental stipulations in regard to organization and administration. Under these basic laws there are regulations governing the three types of secondary schools. Such regulations, unlike the basic laws, are within the jurisdiction of the Ministry of Education and do not have to be passed by the Legislative Yuan, the highest legislative organ of the nation.

Administration

As mentioned before, Article 162 of the Constitution lays down that all public and private educational enterprises and cultural institutions shall be subject to state supervision. The Central Government is responsible for a national educational policy to be observed throughout the country. Thus, the pattern of organization and administration of secondary schools is laid down in regulations by the Ministry of Education; the curriculum is prescribed by the Ministry in the form of standard syllabuses; textbooks are subject to the approval of the Ministry whether they are compiled by the National Institute for Compilation and Translation or by private publishing houses. However, within the framework of the basic laws and regulations, provincial and *hsien* governments are empowered to plan programmes of secondary education to meet their own needs.

Control. Higher education is administered by the Central Government; secondary education, by provincial governments under the general direction of the Ministry of Education; primary education, by *hsien* governments under the general direction of the provincial department of education. The central education authority, the Ministry of Education, exercises over-all control partly through the operation of laws and regulations governing the various types of schools and partly through inspection and supervision. Private schools are under the direct control of their boards of governors, but they must respect laws and regulations set up by the central or provincial authorities.

Supervision and inspection. Each of the three levels of education authority—central, provincial and *hsien*—has its own supervisory personnel. The recruitment of such personnel at each level is based on academic qualifications, professional experience and merit. A teacher must have taught at least 10 years with an excellent record before he can be a supervisor. Supervisory practices vary from province to province, but it is quite common to have both general supervision and also supervision on the basis of subjects. The duty of a supervisor is largely to help teachers solve their own problems. The old concept of 'inspection' is dying out.

In this connexion, the Ministry of Education has issued a regulation to the effect that each teachers' college should organize a supervisory committee on secondary education so as to share the responsibility of supervision. This committee serves as a bridge between secondary schools and various departments of the teacher training institution. It differs from the supervisory bureau of the provincial department of education or of the Ministry of Education in that it lays more emphasis on research and extension service.

Finance. Secondary schools are, as a rule, financed by provincial and *hsien* governments. Private secondary schools are few in number. The funds for public secondary schools come from the Government and are appropriated in accordance with the approved annual budget; they cover teachers' salaries, buildings, equipment, administrative expenses, and a reserve for contingencies. As stated in the Constitution, expenditures for educational programmes, scientific studies and cultural services shall be not less than 25 per cent of the total provincial budget, and not less than 35 per cent of the total *hsien* budget. Statistics show that in the academic year 1956/57, the Taiwan provincial government spent 57.87 per cent of its educational budget on secondary education as against 3.44 per cent on primary education, and that in the same academic year the distribution of educational funds from *hsien* governments in Taiwan was 22.11 per cent for secondary education as against 72.17 per cent for primary education. Fees are charged by public secondary schools, except normal schools, for the simple reason that secondary education has not yet been made compulsory. Academic high schools charge more than vocational high schools. However, parents who have more than 3 children can get some assistance from the authorities. Teachers are paid according to a uniform scale, with annual increments, set up by the Central Government. They are given rations in addition to salary and provided with living quarters.

Buildings and equipment. Standards of space, heating, lighting, sanitation and instructional equipment are laid down in Ministry regulations.

School welfare services. Every pupil upon entering school is given a thorough physical check, and his record is kept on file. Physical examinations are regularly held once a school term. Remedial treatment is given by school clinics, which are usually provided with a doctor and a nurse.

TYPES OF SECONDARY EDUCATION

Pupils who have completed the 6-year primary course can sit for the secondary school entrance examination. The types of secondary education open to them are principally the 3-year junior academic high school and the 3-year vocational high school. Opportunities are also offered by the 5-year or 6-year vocational secondary school, and in the rare cases where it still exists, the 4-year emergency teacher training school. Those who have completed the lower cycle of general secondary education or, less usually, the lower cycle of vocational secondary education, can sit for another entrance examination in order to get into the upper cycle of secondary education under various categories, including the teacher training school and the teacher training course for kindergarten teachers. The 5-year technical school offers another chance for further education. Specialized schools include the school for the deaf and blind, and the school for arts and crafts. To help pupils choose the right type of secondary education, a guidance service is provided and consultation with parents is considered as a part of the service. Further education available for secondary school leavers includes short-term vocational training courses offered by Government or private agencies.

The school year begins on 1 August and ends on 31 July of the following year. It is divided into 2 school terms. Each term has about 20 school weeks, and each week has 6 school days. In addition to national holidays, there are the spring, summer and winter vacations, with a total holiday period of about 80 days per year.

General secondary schools. The aims of secondary education are: (a) development of a healthy physique; (b) cultivation of good citizenship; (c) development of national culture; (d) growth of knowledge and cultivation of skills for better living; (e) formation of good working habits; and (f) cultivation of artistic appreciation. Admittance to both junior and senior high schools is based on competitive entrance examinations. The subjects taught in the lower cycle (3 years) of the academic high school are Chinese, English, civics, history, geography, mathematics, chemistry and physics, natural history, physiology and hygiene, music, art, manual subjects (home economics for girls), and physical education. The total number of teaching periods per week is 28 to 30. In the upper cycle (also 3 years) the subjects are Chinese, English, civics, history, geography, mathematics, biology, chemistry, physics, music, art, manual subjects (home economics for girls), physical education, and military training. The total number of teaching periods per week is usually 30 to 32.

In recent years some new curriculum patterns have been tried out. One is the new curriculum for junior high schools, based on the concept of 'life-centred' education. Activities are grouped in such broad fields as social studies, natural science, language, mathematics, recreational and productive work, but social studies is taken as the centre toward which work in all the other fields is related so as to make learning activities more meaningful to the pupils. Furthermore, subject matter is selected in such a way as to help solve problems encountered in everyday life.

Another new pattern of curriculum is being tried out for the 6-year academic high school divided into 2 cycles, requiring 4 years for the first cycle and 2 years for the second. Pupils who have completed the first cycle will be automatically promoted to the second cycle without taking another entrance examination. The curriculum for the first cycle is more general and that for the second cycle is differentiated into arts and science sections. Roughly speaking, pupils in the arts section take more courses in language and social studies, while those in the science section have a heavier load in mathematics and natural science.

The lecture method and recitation method are still commonly used in classroom teaching. However, the experiment in life-centred education has made some healthy changes. With the system adopted in the organization of subject matter (described above) go the resource units and teaching units based on a central theme or problem and developed co-operatively in planning, execution, and evaluation by pupils under the leadership of the classroom teacher. In addition to the general methods

GLOSSARY

chien-yi shih-fan hsueh-hsiao: emergency teacher training school for teachers in the lower cycle of the primary school.

chien-yi shih-fan ko: emergency teacher training course for teachers in the lower cycle of the primary school.

chih-yeh hsueh-hsiao: vocational secondary school.

chung-hsueh: general secondary school comprising a lower cycle (*tsu-chieh*) and upper cycle (*kao-chieh*).

chung-sin kuo-min hsueh-hsiao (central citizens' school): primary school with a lower cycle (*tsu-chieh*) of 4 years and an upper cycle (*kao-chieh*) of 2 years.

hsiao-hsueh: a name for the primary school either subordinate to a teacher training school or established by a private body.

kao-chieh: upper cycle (see *chung-hsueh* and *hsiao-hsueh*).

kao-chieh chih-yeh hsueh-hsiao: upper vocational secondary school.

kuo-min hsueh-hsiao (citizens' school): primary school with a 4-year course.

shih-fan hsueh-hsiao: teacher training school.

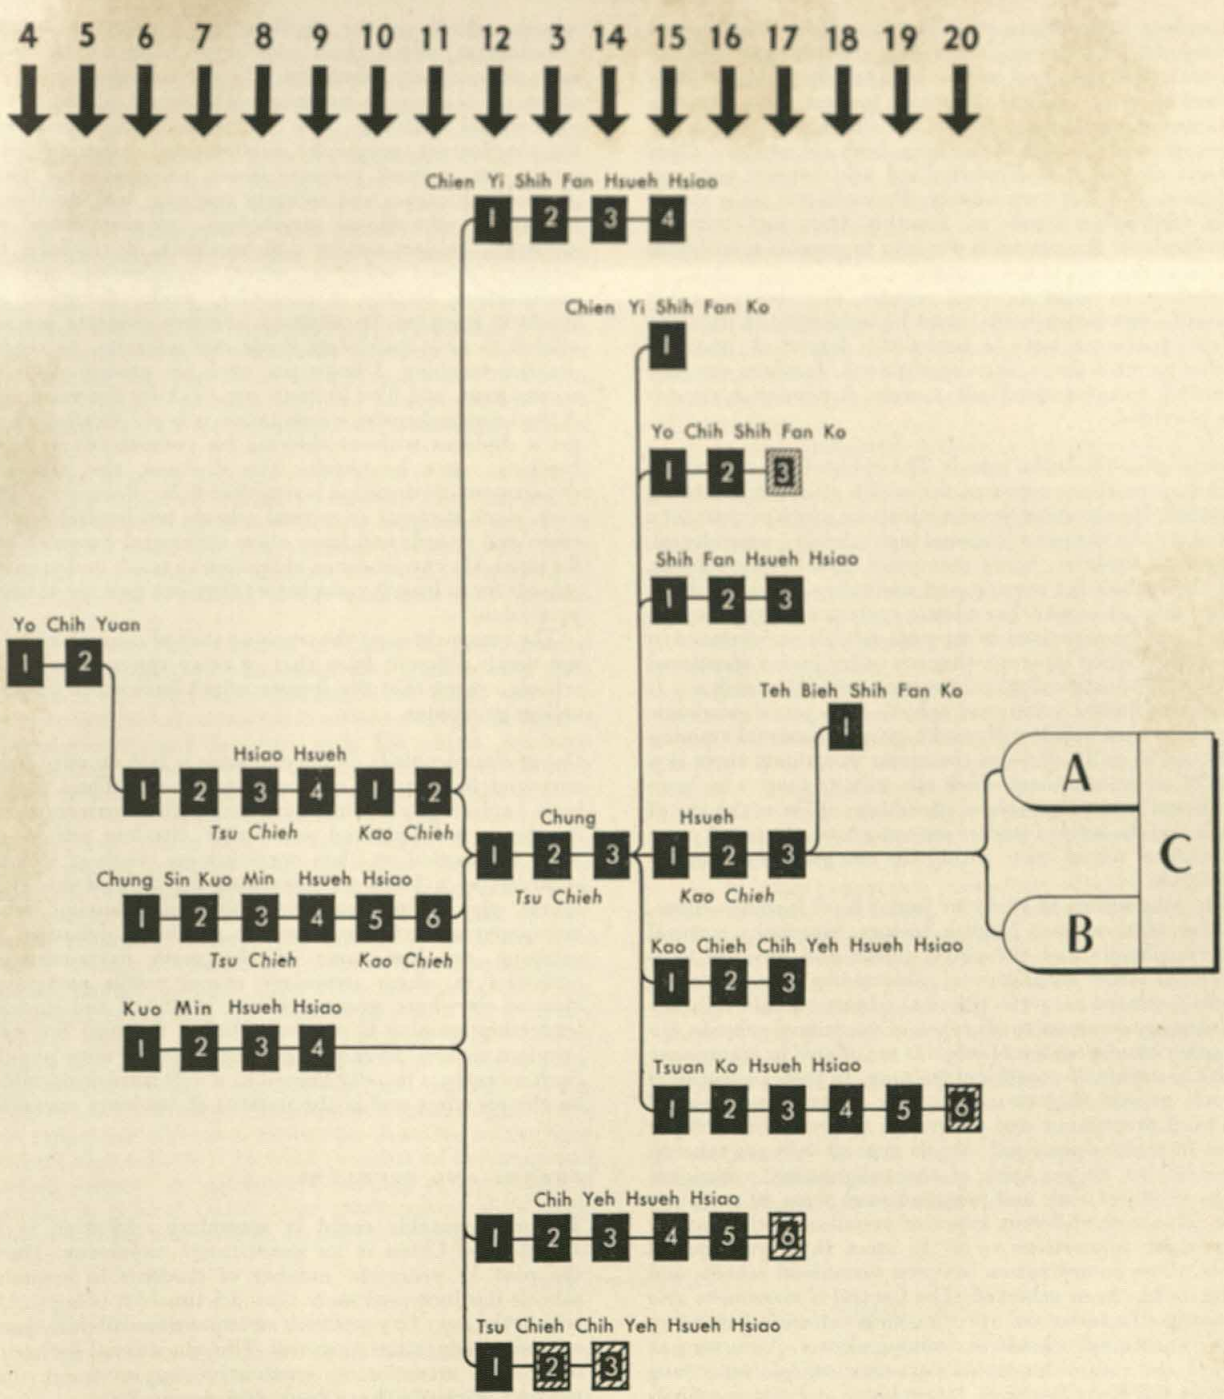
teh-bieh shih-fan ko: emergency teacher training course for teachers in the upper cycle of the primary school.

tsu-chieh: lower cycle (see *chung-hsueh* and *hsiao-hsueh*).

tsu-chieh chih-yeh hsueh-hsiao: lower vocational secondary school.

tsuan-ko hsueh-hsiao: 5-year or 6-year technical school admitting junior high school graduates as entrants and offering a 5- or 6-year continuous course with the last 2 or 3 years at a junior college level.

yo-chih shih-fan ko: teacher training course for kindergarten teachers.



yo-chih yuan (kindergarten): pre-primary school.

HIGHER EDUCATION

A. *Ta-hsueh:* universities; 4-year courses except faculty of medicine (6 years) and institute of education (5 years).

B. *Tsuan-ko hsueh-hsiao:* junior colleges; 3-years courses except in medicine and teacher training (each 4 years).

C. *Yen-chio-yuan:* research institutes at post-university level.

of teaching appropriate to different subject fields, group discussions, interviews, surveys, exhibitions, demonstrations, field trips and audio-visual teaching aids are fully utilized so as to make the teaching process more dynamic and more closely related to real life situations.

In measuring results of teaching, both old and new types of tests are adopted. Standardized achievement tests are also used, but not very widely. Promotion is on a yearly basis, depending much on monthly tests and terminal examinations. Report cards are sent to parents monthly as well as at the end of a semester.

Teachers in academic high schools, like those in other types of secondary schools, must be university or teachers' college graduates with a bachelor's degree. A qualified teacher's certificate is likewise required. Teachers are paid according to a standard salary scale. A pension system is also provided.

Vocational and technical schools. These schools are specialized according to the occupation for which students are being prepared. The secondary level institutions which prepare for a career are the various vocational high schools—agricultural, industrial, business, home economics, and fishery schools, and the schools for nursing and midwifery. Each of them, except the last-named, has a lower cycle and an upper cycle, which may be organized as separate schools or combined in one school. When separate, they are called junior vocational and senior vocational schools respectively. The tendency is to convert junior vocational schools into junior academic schools so that pupils will not be given vocational training until age 15 or 16. Besides the senior vocational there is a type of technical school,which also admits those who have completed junior high school education; as far as the age of pupils and the level of studies are concerned, the first 3 years of technical school come within the category of secondary education.

The programme of study at junior level includes civics, Chinese, mathematics, English, history, geography, natural history, physics and chemistry, music and physical education. At senior level, general subjects like civics, Chinese, English, related subjects, physical education, and military training are common to all types of vocational schools. On the other hand, vocational subjects are offered in accordance with the nature of vocational training. In junior vocational schools general subjects account for about 40 per cent of the total programme and vocational subjects about 60 per cent. In senior vocational schools general subjects take up about 20 to 30 per cent of the programme, vocational subjects 30 per cent, and practical work from 40 to 50 per cent. However, different types of vocational schools may vary these proportions so as to meet their own special needs. Close co-ordination between vocational schools and factories has been achieved. The Central Government also encourages factories and other business enterprises to set up either vocational schools or training classes. A movement toward the establishment of part-time schools for young workers has been launched. Attendance at evening schools is greatly increasing; the teaching programme comprises both practical and cultural subjects.

Teacher training schools. Training teachers for elementary schools has long been the responsibility of the 'normal' schools, which, on the results of a competitive entrance examination, admit those who have completed the lower cycle of secondary education. The normal school generally offers a 3-year course covering both general education and professional training. The curriculum includes civics, Chinese, history, geography, mathematics, natural science, music, art, manual subjects (home economics for girls), physical education and military training, introduction to education, educational psychology, measurements and statistics, subject-matter and methods of teaching elementary school subjects, school organization and administration, history of education, adult education, and teaching practice. In addition, elective subjects are also offered to meet individual needs and interests. As regards practice teaching, 2 hours per week are presented for the second year, and 8 to 10 hours per week for the third year. A final comprehensive examination is held. No student can get a diploma without showing his competence in actual teaching; once he obtains this diploma, the provincial department of education is responsible for placement. However, since students in normal schools receive free tuition, room and board, and have other incidental expenses paid for them, they are under an obligation to teach in elementary schools for at least 3 years before they can quit the teaching profession.

The composition of the teaching staff of normal schools is not much different from that of other types of secondary schools except that the former would have more teachers' college graduates.

Out-of-class activities. Much emphasis is laid on out-of-class activities in all types of secondary schools. Their purpose is to explore pupils' interests, enrich the curriculum, and develop a well-balanced personality. Student self-government is founded on class organizations, each of which is regarded as a basic self-governing body. Academic clubs, sports, glee clubs, dramatic clubs, folk dancing, school newspaper and yearbook, public speaking, debating and camping are but some of the main extra-curricular activities in which secondary school pupils participate. Here as elsewhere, group guidance is offered and students' leadership training is stressed. During the past few years 'student centres' have been getting more and more popular. Such a centre is usually housed in a well-furnished building on the premises and is the nucleus of students' social life.

TRENDS AND PROBLEMS

The most notable trend in secondary education in the Republic of China is its quantitative expansion. During the past 12 years the number of students in secondary schools has increased more than 3.5 times; it is hoped that within the next 10 years such an expansion will make junior secondary education universal. The educational authorities pay equal attention to qualitative improvement. Four guiding principles have been laid down. First, provincial secondary schools shall expand primarily in the direction of senior grades and local schools in that of junior grades. Second, in order to avoid concentration of secondary schools in cities, preference shall be given to the establishment of new schools in rural areas. Third, priority shall be given to

the expansion of vocational schools. Fourth, efforts shall be made to improve the existing secondary schools.

Closely related to the expansion of secondary education is the community school movement, ensuring better co-ordination between the school and the community, and between school and life. With the assistance of the International Co-operation Administration (ICA) Mission to China, in the academic year 1953–54 two county high schools were designated as pilot schools. Since then, the number of schools undertaking this kind of education has increased to 17 secondary schools and 25 primary schools. Since the fundamental principles of community school education are warmly supported by the general public, some counties are now voluntarily planning to implement this educational programme on a larger scale. Moreover, Taiwan Normal University and two normal schools have been instructed to set up courses on community school education.

Another trend in secondary education is the promotion and improvement of science education. The Ministry of Education has already worked out a long-term project in collaboration with the ICA mission. Although the main emphasis in carrying out this project is on institutions of higher learning, a portion of the available funds goes to secondary schools.

Since Taiwan was restored to China in 1945, general secondary schools have increased at a greater rate than vocational schools. Hence, measures are being taken to promote vocational education in order to safeguard against unemployment and to cope with the rapid economic development of the nation. Not only are the establishment of new vocational schools and the expansion of the number of classes in existing vocational schools considered a priority, but much effort is also made in promoting craftsmanship training. The provincial department of education has already set up this kind of training centre in 4 municipal and county vocational schools and 15 provincial vocational schools. For instance, one of the provincial industrial vocational schools offers four different courses, namely, electric appliances, mechanical drawing, motorcycle repair and radio appliance repair. As a further example one of the business vocational schools offers Chinese and English typewriting, graphical representation, paper-flower making, salesmanship, and waiter training.

There has been considerable improvement in agricultural and industrial education. Since the objective of the agricultural high schools is to train students to be competent modern farmers, comprehensive training in knowledge of farming in general rather than specialization in a single subject is being emphasized. In the revised curriculum, the original vocational subjects in junior agricultural schools are now simplified into agriculture, farm mechanics, and farm practice. At senior level, agricultural schools are no longer divided into several departments. General training carries much weight. Subjects like agronomy, horticulture, animal husbandry, forestry, processing of farm products, farm mechanics, and agricultural meteorology are taught to all pupils. Where facilities permit, two or three elective courses will be added in the last year to meet local needs. Other improvements which have been made are in farm practice, methods of teaching, extension education, in-school rural youth organization (4H clubs), co-operation of schools with farmers and local agricultural organizations, experimental farm food processing plants and, above all, teacher training, for which a department of agricultural education has been established at Taiwan Provincial College of Agriculture.

As regards industrial schools, a comprehensive survey was conducted in 1953 by Taiwan Normal University in collaboration with the provincial department of education with the assistance of a Pennsylvania State University team. As a result of this survey, the curriculum has been reconstructed. The basic idea that has been followed in improving industrial education is the adoption of unit-trade courses in order to train skilled workers for industry. There is a curriculum laboratory at Taiwan Normal University to develop the course of study for such training, based on an analysis of the trade to be taught. The content of the course is then worked out and arranged in the order in which it is best taught, utilizing as many 'live' projects as possible. Unit-trade courses for 10 occupations have been set up. These include courses for training machinists, electricians, radio repair men, automechanics, carpenters, pattern makers, foundry men, plumbers, printers, and sheet metal workers.

As in other countries, secondary education in China presents many problems. The increase in the money available for education is not able to cope with the rapid growth of the school population; secondly, because of the rapid expansion of secondary schools, more and more teachers are needed, particularly in vocational schools. In order to help overcome the latter difficulty, measures have been taken to have a well-planned teacher training programme, to improve the welfare of teachers, and to strengthen supervision and in-service training.

STATISTICS

Population (mid-year 1958 estimate): 9,851,000.
Area: 13,885 square miles; 35,961 square kilometres.
Population density: 709 per square mile; 274 per square kilometre.

Summary of school statistics, 1953–57. In the school year 1957/58 about 1,838,000 pupils were enrolled in schools and institutions from pre-primary to university level. There were in addition nearly 198,000 students enrolled in adult education classes. In all, over 21 per cent of the total population was receiving some form of education. Excluding adult education, nearly 84 per cent of all pupils were in pre-primary and primary schools; about 11 per cent in general secondary and teacher training courses; 4 per cent in vocational secondary schools, and over 1 per cent were enrolled in university courses including teacher training at higher education level. The proportion of girls enrolled in 1957/58 was over 46 per cent in primary schools compared with 43 per cent in 1953/54. In general secondary schools, girls formed 34 per cent of total enrolment in 1957/58 against 32 per cent in 1953/54. The increase in total enrolment in primary schools was 38 per cent and in general secondary schools 85 per cent over the period under review. In 1957/58 the average pupil teacher ratios in primary and general secondary schools were 46 and 23 respectively; these ratios were the same as in 1953/54, but in view of the very considerable increase in enrolment, especially in secondary schools during the 5-year period this represents a considerable achievement. The number of general secondary school teachers increased by nearly 80 per cent between 1953/54 and 1957/58. (See Table 1.)

Enrolment trends in secondary education, 1930–57. Enrolment in secondary schools has increased very rapidly since 1930 as shown in Table 2. The average total enrolment in secondary general, vocational and teacher training institutions has increased by over 10 per cent per year since 1940 and the ratio of secondary enrolment to the age group 15 to 19 years old has risen steadily from 4 in 1930–34 to 26 in 1955–57.

Examination results in secondary education, 1953–57. The number of successful candidates for the General High Schools Certificate increased by 87 per cent over this period; and for teaching diplomas, by 58 per cent. Without exception, the number of diplomas granted by industrial, commercial and agricultural schools rose steadily during the five years under review. In all, nearly 68,000 students —about one third of them women—qualified for the various secondary level diplomas in 1957/58, compared with a total of 37,000 successful candidates for the same examinations in 1953/54. (See Table 4.)

Educational finance, 1958/59. Total expenditure on education in 1958/59 (fiscal year commencing July) amounted to 1,085 million new Taiwan yuan, representing about 110 yuan per inhabitant. The breakdown of expenditure by level and type of education is given in Table 3.

CHINA
(Mainland)

THE EDUCATIONAL SYSTEM

The present educational system dates back to 1935, when the Chinese Red Army marched into Northern Shensi and established a base in North-West China, with a new political and educational pattern for that region. When the Chinese Communist Party came to power in 1949, the reforms were extended to the rest of the country. In September 1949 a People's Political Consultative Conference was called, which adopted a 'common programme' laying down the general policy for national affairs, including education. This common programme was adopted as part of the national constitution at the First National People's Congress in 1954.

Article 94 of the Constitution stipulates: 'Citizens of the People's Republic of China have the right to education. To guarantee the enjoyment of this right the State shall establish and gradually extend the various types of school and other cultural and educational institutions. The State will pay special attention to the physical and mental development of young people.'

The Constitution provides that women shall have equal rights with men, and safeguards the rights of national minorities.

A basic definition of educational policy was first given in the 1949 common programme. This specifies that education in People's China is to be national, scientific and popular in character. The aim is to raise the cultural level of the people, particularly of workers and peasants, by equipping them intellectually, morally, ideologically and technically to become constructive citizens of the new Socialist State.

In 1951 the State Council issued a decree entitled 'Decisions concerning the reform of the educational system' which provided the framework for the component parts of the educational system.

In 1953 the Government launched the first 5-year plan (1953–57) for development of the national economy. Within the over-all provisions for progress towards economic and social goals, the plan set targets for achievement in each branch of the school system. The principle of integrated planning as a basis of educational policy has continued with the second 5-year plan (1958–62).

In September 1958 the Central Committee of the Chinese Communist Party and the State Council issued a directive on the revolution in education which establishes the tasks before educators during the second 5-year plan and in the years ahead. The immediate goals are to wipe out illiteracy, chiefly among young and middle-aged workers and peasants, and to make primary education universal. At the same time, secondary education is to be developed, particularly in rural areas, and progress in

specialized secondary and higher education accelerated, so that lower secondary school education may progressively be universalized during the third 5-year plan. The document stresses the need for a close link between teaching and productive work.

The Central Ministry of Education under the State Council is the highest authority for the control of pre-primary, primary, secondary and adult education, teacher training and special education, while the Ministry of Higher Education controls all the institutions of higher learning and the intermediate technical schools. The Ministry of Education issues directives in respect of the administration and organization of schools, curricula, textbooks and methodology, and exercises general supervision over primary, secondary and adult education. In all the provinces and municipalities there are educational bureaux and educational and cultural offices in the special districts and counties. These bureaux and offices are under the leadership of people's committees at their corresponding levels, as well as under the educational administrative bodies at higher levels.

The Ministry of Education takes counsel with education authorities and educationists through centrally organized conferences. These conferences may be general or specific, dealing with the whole of education or with one particular problem. Since 1951 a number of such conferences have been organized, many of them resulting in government directives. Often the directives are issued on a provisional basis, tried out and studied for a few years and when necessary amended. Following the 1958 directive on the revolution in education, an important national conference of groups and workers in the fields of education, culture, health and physical culture is being convened in June 1960.

The central and local budgets for education are included in the national budget. For 1959, expenditures on educational, social and cultural programmes made up 11 per cent of the total state budget. The budget is fixed centrally but is administered at various levels under the responsibility of the corresponding administrative units. Schools under the direct supervision of the Central Ministry of Education come under the central budget, schools at provincial or municipal level under the local budget. There is no direct connexion between the central and the local budgets. When the Ministry of Education requires additional funds to meet its needs, it applies to the State Council for additional appropriations, whereas provincial and municipal educational bureaux submit requests for additional funds to the provincial or municipal People's Committee. If the provincial or municipal budget is unable to meet these requests, the People's Committee applies for aid from the State Council.

Schools established and maintained by voluntary contributions are not included in the national budget, but there is a state subsidy fund which will help any private or communal school in difficulties. The subsidy amounts to between 20 and 50 per cent of the budget of the school.

The structure of the school system is still in the process of reorganization. Nominally the 6-3-3-4 arrangement developed before 1949 remains. However, the 6-year primary school, in reality a double-track system with a 4-year rural course and a complete 6-year urban school, is giving way to a single continuous course of 5 years. At the secondary level, experiments are in progress to arrive at a unitary school of general education which will probably last 10 years. Similarly, courses in higher education have been shortened wherever possible.

It is characteristic of the present school system that a wide range of part-time (or half-day) schools and evening schools have been set up with curricula that are equivalent to those of the full-time institutions.

THE DEVELOPMENT OF SECONDARY EDUCATION

Until 1949 secondary education was organized in middle schools with two cycles of study, 3 + 3, and a clear distinction was made between the academic type, the teacher training schools and the vocational schools.

During the period from 1949 to the end of the first 5-year plan priority was given to the extension of primary schooling and the organization of literacy work and formal schooling for young adults. Secondary education made steady progress during this period, particularly through the expansion of establishments for training primary school teachers and of accelerated courses for young workers and peasants. For the latter purpose, two types of institution were evolved. The short-term schools provided a 2 to 3-year primary course for young people with no previous education. Those passing this course, or with a primary school background, were eligible for the short-term middle school which had a 3- to 4-year course. The other type of institution was the spare-time or evening course, where the same curriculum was covered more slowly.

Since 1956 greater stress has been laid on the expansion of secondary education and on the reform of its content. The directives of September 1958 and the objectives of the second 5-year plan show that this expansion is designed to lead later to making secondary education available to all. Particular attention is being given to providing secondary education in rural areas by adding classes to existing primary schools, by setting up new secondary schools and by the institution of a new type of school, the secondary agricultural school.

Secondary education, like other branches, is affected also by the directive to strengthen the link between schooling and productive labour. Beside the general secondary school there is a growing range of specialized or vocational secondary schools which prepare young people for various trades and occupations. Secondary schools are encouraged to set up workshops or farms for productive purposes; it is reported that during 1958 some 1,860 specialized secondary schools created 21,500 entreprises of this type, and 18,865 general secondary schools created over 122,000 industrial and factory enterprises. A reciprocal form of link occurs when factories establish branches or workshops in schools where qualified workers supervise the apprenticeship training of the students. In addition to the time provided for productive work in school time-tables, the lower secondary grades (7 to 9) devote 4 hours per week and the upper grades (10 to 12) 6 hours per week to such activities.

In regard to the organization and content of schooling, the trend since 1958 has been to undertake experiments on a comparatively large scale which could contribute to reforms.

The relation of schooling to productive labour is one of the problems studied experimentally. In the organization of secondary education, six provinces are experimenting with an integrated 5-year curriculum. Two other provinces are trying out schemes for a continuous course of 10 years to cover general primary and secondary education, and in a third province the total period is reduced to 9 years. In these experiments, the stress is laid on improved teaching methods and materials and on the organization of all-round collaboration among teachers under the leadership of the Party committees. The tool subjects of language and mathematics are being given special attention, since improvements here will have a wide effect on curriculum construction.

It is not expected that these experiments will lead to immediate reform. The preliminary conception of the new educational system is a full-time primary and secondary education with the time reduced to about 10 years and the standard raised to approximate that of the first year of the present universities. Such a school system would be available to all and would not compete, as the present 12-year system does, with the national needs for man power. However, the Government sees the reform taking 10 or 20 years, and being introduced step by step and by stages and groups.

TYPES OF SECONDARY EDUCATION

On completing primary school, the pupil has before him the general secondary (or middle) school, and a wide range of vocational secondary schools, some of which parallel the lower cycle of general education while others follow it. In addition, both general and specialized secondary education may be obtained through accelerated and evening courses. Entrance to secondary schools is by way of competitive examination. In 1954/55, before the recent drive to expand secondary education, there were reported to be 4 to 5 candidates for each place available.

General secondary schools

The middle schools comprise lower and upper cycles of 3 years each. Some idea of the movement of students may be obtained from the following figures. Between 1949 and 1957, some 4,360,000 students completed the junior middle course; of these 2,950,000 entered the senior course, while 1,410,000 went to work in industry and agriculture. During the same period, 720,000 students completed the senior middle school, and the great majority of them continued with higher education.

The curriculum followed in 1958/59 is shown in the following table. Examinations are held at the end of each cycle. A written examination, uniform throughout the country, is given to university entrance candidates at more than 100 different centres.

Secondary school teachers are trained at institutes of education and are expected to have completed a university degree. However, the combined effects of the expansion of

schools and the need for university graduates (especially in mathematics and sciences) in other sectors of the economy have resulted in a great shortage of qualified teachers. Since 1954, the Ministry of Education has had to instruct local governments to introduce short-term training courses of 2 years at post-secondary level for senior middle school teachers and of 1 year for junior middle teachers. There is also a widespread system of in-service training, through evening and correspondence courses, to enable teachers to acquire the necessary qualifications.

Vocational and technical schools

In this sector of secondary education students are assisted in a number of ways, by free tuition and textbooks, board and lodging.

The largest single group of vocational schools are the normal schools for training primary school teachers with a course at upper middle level.

Vocational and trade schools prepare students for particular occupations in industry and agriculture, and have various courses at junior and senior middle school level. The spare-time secondary schools are chiefly designed for training in the industrial trades of the locality. An innovation in 1958 was the agricultural secondary school—a rural half-time school with a 3-year course which by the end of 1959 had an enrolment of over 2 million (compared with 7 million enrolled in junior middle schools). The agricultural secondary school follows some middle school syllabuses (in Chinese, mathematics, socialist education, physics and chemistry) but devotes special attention to technical courses in agriculture. The schools are maintained by the popular communes and represent the principal means by which secondary education is being expanded in rural areas.

STATISTICS

Population (mid-year 1958 estimate): 669,000,000.
Area: 3,768,736 square miles; 9,761,012 square kilometres.
Population density: 178 per square mile; 69 per square kilometre.

Summary of school statistics, 1953–55. In 1955/56, total pupil enrolment exceeded 60 million, and was about 10 per cent of the total population. Of these pupils, 1 per cent were enrolled in kindergartens, 87 per cent in primary schools, more than 6 per cent in secondary schools, 1 per cent in vocational and teacher training schools together, and 4 per cent in institutions of higher education (including special courses and research). The teaching staff in pre-primary, primary and secondary education consisted of 1,8 million teachers. Pupil-teacher ratio was 33 in primary schools, 26 in secondary schools, and 9 in universities. Between 1953 and 1955, total enrolment increased by 3 per cent in primary schools, 33 per cent in secondary schools, and more than doubled in universities. (See Table 2.)

Enrolment trends in secondary education, 1949–55. Between 1950 and 1955, enrolment in general secondary schools increased three times, and in vocational schools slightly more than three times. In teacher training, maximum enrolment was reported for 1953, there being a substantial reduction between 1953 and 1955. Table 1 shows the secondary enrolment ratio increasing more than threefold between 1950 and 1955; for the latter year total secondary school enrolment represented 8 per cent of the estimated population 15–19 years old.

COLOMBIA

THE EDUCATIONAL SYSTEM

Article 41 of the Constitution of 16 February 1945 guarantees freedom of education. 'The State, however, shall exercise general supervision of institutions of learning, both public and private, in order to ensure that the social aims of culture and the best intellectual, moral and physical development of the students are achieved.' Article 41 also provides that primary education shall be free in the state schools, and compulsory 'up to the grade determined by law'.

Colombia has several different ethnic groups, and the

cultural level of the inhabitants varies considerably from one geographical region to another; but the fundamental, unbreakable bond uniting the country is the Spanish language, spoken throughout the territory of the Republic. A few rare exceptions are mission territories where the indigenous population is taught in its own dialect but at the same time easily assimilates Spanish. The common language, together with the Catholic faith to which practically all Colombians adhere, is a cohesive force which has, until now, made a unified national educational system possible.

The Minister of Education is a member of the Cabinet and is responsible for administering the school system. He is assisted by a Higher Council for Education and by an office of educational planning. His immediate collaborators are a secretary-general, an under-secretary for educational and cultural affairs and an under-secretary for administration. The directors of the following divisions are subordinate to the offices of the under-secretaries: (a) primary education and teacher training; (b) secondary education (*bachillerato*); (c) technical education; (d) rural education; (e) women's education; (f) cultural extension and fine arts; (g) libraries and archives, with their sections and subordinate bodies.

The central authorities work in close co-operation with the regional educational authorities; a secretary of education appointed by the Minister resides in the capital of each department, district (*intendencia*) or administrative division (*comisaría*) and is assisted by a staff of inspectors. Cities of over 100,000 inhabitants have similarly organized offices of education. The other cities and the rural districts have local inspectors who work under the authorities of the local sections. Parish priests are accustomed to acting as local inspectors of education in a few municipalities.

Private bodies (the Church, business, industry, etc.) are a very important factor in Colombian education, providing about 85 per cent of the schools. Since the Government, on account of its limited financial resources, is unable to carry out the constitutional provisions regarding education, it gives various forms of assistance to private bodies whose collaboration is essential in raising the cultural level in Colombia.

The structure of the school system is shown in the diagram on page 373.

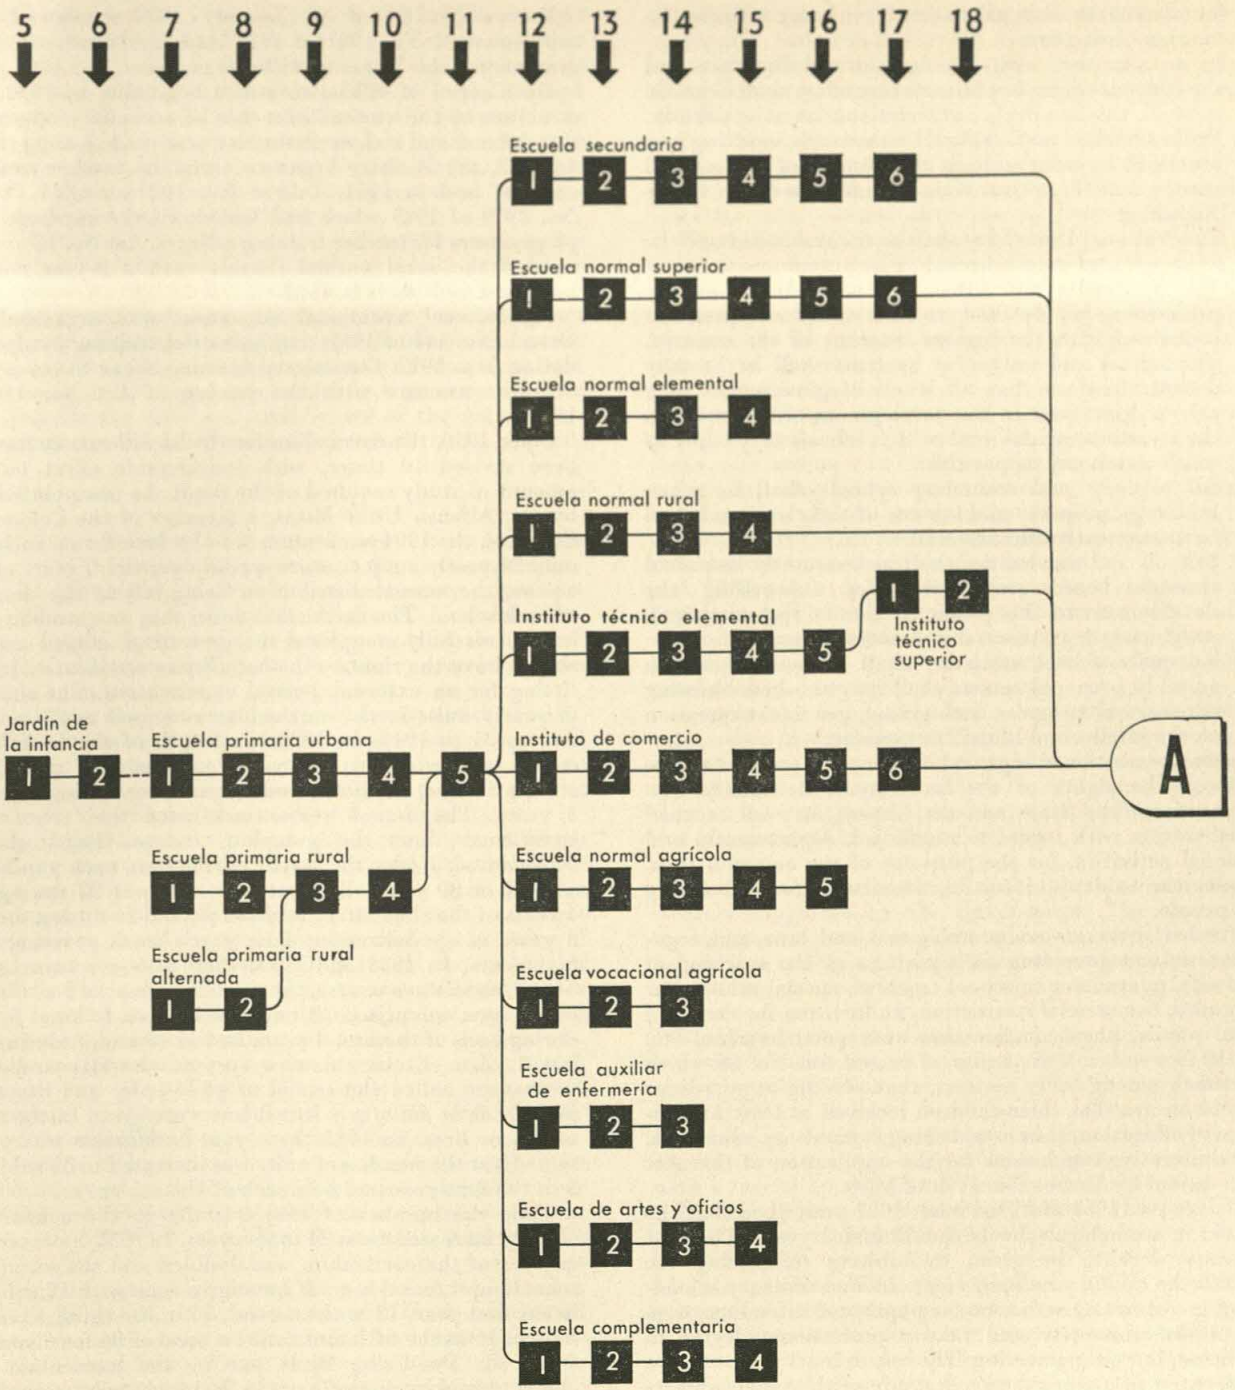
THE DEVELOPMENT OF SECONDARY EDUCATION

'Secondary education' in Colombia refers to any type of education based on successful completion of primary studies. It is divided into the following branches: general (*bachillerato*), industrial, commercial, farming, complementary, teacher training, rural home economics, nursing, fine arts, religious and unspecified.

Historical and legal basis

An important development in Colombian education was the approval by Congress, in 1903, of Act No. 39, on the organization of public education. This law, which is still in force despite later provisions, introduced far-reaching reforms, and laid down that instruction should be adapted to the peculiar conditions of the country and to the needs of modern life. Effect was given to this Act by Decree No. 401 of 3 June 1904, which in its 181 articles, contained regulations covering every branch of education.

The Minister of Public Education summed up the provisions of the Act as follows:



'1. Education shall be free at every grade.
'2. Primary education must be simplified so that it may become more widely spread; it must prepare children for citizenship by awakening and stimulating their love of their country; it must also prepare them for agriculture, manufacturing industries and trade and must ensure that, through religious and physical instruction, they will develop into healthy, vigorous and upright men and women.
'3. The teacher training schools must train practically-minded teachers rather than scholars.
'4. Secondary education shall be mainly technical and shall, through the study of living languages and the elements of the physical sciences and mathematics, prepare pupils for professional careers in industry.
'5. Classical secondary education, comprising literary and philosophical subjects, shall give adequate preparation for the liberal professions.
'6. Industrial instruction shall be given the widest possible development; schools of arts and crafts and workshop-schools to train skilled craftsmen shall be

GLOSSARY

escuela auxiliar de enfermería: vocational training school for nursing assistants.
escuela complementaria: vocational secondary school with varied programme of general and vocational subjects.
escuela de artes y oficios: vocational training school of arts and trades.
escuela normal agrícola: specialized teacher training school for teachers in agricultural schools.
escuela normal elemental: teacher training school for teachers in urban primary schools.
escuela normal rural: teacher training school for teachers in rural primary schools.
escuela normal superior: teacher training school for teachers in secondary schools.
escuela primaria rural alternada: incomplete double-session primary school (classes for boys in the mornings, girls in the afternoon) in rural areas.
escuela primaria rural: rural primary school (separate schools for boys and girls).
escuela primaria urbana: urban primary school.
escuela secundaria: general secondary school with course leading to the *bachillerato* or baccalaureate examination.
escuela vocacional agrícola: vocational training school of agriculture.
instituto de comercio: vocational secondary school of commerce.
instituto técnico elemental: vocational secondary school of industrial arts.
instituto técnico superior: vocational school for advanced technical training.
jardín de la infancia (kindergarten): pre-primary school.

founded in the main urban centres in order to foster the manufacturing arts.

'7. In co-operation with the Agricultural Institute and the National School of Mines every effort shall be made to work the country's natural resources scientifically.

'8. Professional education shall be thorough, exacting and practical, in order to limit the number of doctors and ensure that those thus trained shall be a credit to the Republic.

'9. The National University shall be re-established and the departmental universities shall be autonomous.

'10. The academies and other learned bodies shall, by preference, be devoted to the study of questions connected with the highest interests of the country.

'11. The school and university systems shall be broadly decentralized so that all levels of government may take a direct part in the development of education in their various regions, and so that schools may enjoy as much autonomy as possible.

'12. All primary and secondary schools shall be given buildings, property and income of their own and shall be competently administered.

'13. Schools and universities shall be constantly inspected through boards responsible for supervising the development of this public service at the municipal, provincial, departmental and national levels.

'14. Adequate school statistics shall be issued; and a suitably prepared review shall be published, showing educational progress and giving genuine expression to the intellectual life of the country.'

The above-mentioned organic law created a proper balance between the rights of the individual, the family, the corporations, the State and the Church, as well as good collaboration with regard to municipal, departmental and national activities, for the purposes of the common task, at once many-sided and fruitful, of instructing and educating the people.

Further decrees were promulgated and laws and regulations issued governing such matters as the teaching of fine arts, guarantees to school teachers, special schools for juveniles, commercial instruction, an institute for deaf and blind pupils, physical education and sport, hygiene, etc. On 10 November 1927, Congress passed Act No. 56 which provided, among other matters, that parents or guardians should ensure that their children received at least a minimum of education, thus establishing compulsory education. Administrative regulations for the application of this Act were issued by Decree No. 1790 of 1930.

Decree No. 1951 of 2 December 1927 prescribed that the course in secondary schools should last 7 years. The first 4 years were to be given to subjects comprising the *bachillerato común y ordinario* (general and ordinary school-leaving certificate) sufficient for pupils not intending to go on to the university and take a professional degree in medicine, law or engineering. The remaining 3 years were to be devoted to a more thorough study of the same subjects of the *bachillerato* course for pupils specializing in courses more nearly related to the professional career they had chosen. Only the first 4 years of secondary education were required for admission to certain higher educational institutions such as agricultural, commercial and other schools.

Decree No. 57 of 13 January 1928 confirmed and supplemented No. 1951 of 1927 and laid down the programme for the 7-year *bachillerato* course.

By a series of official measures beginning in 1930, the structure of the various branches of secondary education was defined and a clear distinction was made among them. In 1933, the Ministry began to unify the teacher training courses; and in 1951, Decree No. 192 amended Decree No. 2979 of 1945 which had laid down the curricula and programmes for teacher training colleges. Act No. 12 of 1934 created the rural normal schools with a 3-year course, increased to 4 years in 1953.

Agricultural vocational education was organized by Decree No. 543 of 1941, and industrial training by decrees dating from 1917. Commercial training began to receive its definite structure with the passing of Act No. 143 in 1948.

Since 1930, the curriculum for the *bachillerato* course has been revised 10 times, with considerable effect on the amount of study required of the pupil. As was pointed out by Dr. Alfonso Uribe Misas, a member of the Colombian Congress, the 1904 curriculum for the *bachillerato* included only 24 yearly subject units spread over the 6 years of the course, the annual distribution being left to the decision of each school. The decree laid down that any student who had successfully completed the prescribed subject courses should have the right to the *bachillerato* certificate without sitting for an external general examination. The number of yearly units in the curriculum increased to 28 in 1910 and to 31 in 1919. In 1929 the length of the *bachillerato* course was extended to 7 years and included specialized studies in law, medicine and engineering during the last 3 years. The first 4 years constituted the 'elementary *bachillerato*' and the complete course the 'technical *bachillerato*'. Under the 7-year curriculum, each pupil took a total of 39 units distributed as follows: 23 during the 4 years of the elementary *bachillerato* and 16 during the last 3 years of specialization, each year's work covering 5 or 6 subjects. In 1933 and 1934, there was a return to the 6-year *bachillerato* course, the so-called classical *bachillerato*, which now comprised 33 units divided as follows: 5 or 6 during each of the first 4 years and 11 (5 and 6) during the last 2 years. Under this new system, the fifth and sixth years were called the school of philosophy and literature (*escuela de la filosofía y letras*) but were given in the same *colegio* or *liceo*. In 1935 the 6-year *bachillerato* was maintained but the number of units was increased to 35 subjects, 5 in the first year and 6 in each of the others.

Thus the number of subject units in the course had already increased from 24 to 35 a year. In 1936, however, the content of the curriculum was doubled and the secondary school pupil found himself having to cope with 12 subjects in the first year, 13 in the second, 14 in the third, 15 in the fourth, 16 in the fifth and sixth: a total of 86 for 6 years of study. As Dr. Uribe Misas put it, the curriculum was characterized by *pansofía* or the desire to study everything, by an incredible sub-division and fragmentation of subjects, and by 'the infernal labyrinth of the cyclic method'. As regards syllabuses there was considerable lack of uniformity, and the criteria were not the same for public or official schools as for private educational institutions.

The number of subject units fell to 75 in 1937 and to 59

in 1940 but was 66 in 1949 and 1950 and 63 in 1951. In 1952 there was a slight relief. Pupils took 7 subjects in their first year and 8 in each of the 5 succeeding years, a total of 47 for the 6 years. Finally, Decree No. 2550 of 1951 and Resolution No. 73 of 1953, which are still in force, were promulgated, and the number of subjects again rose to 13 in the first year, 11 in the second, 12 in the third, 10 in the fourth, 9 in the fifth and 13 in the sixth, or a total, throughout the 6-year course, of 68 units.

In March 1955, Legislative Decree No. 925 established a curriculum for the so-called *bachillerato básico* (equivalent to a school-leaving certificate), that is, the first 4 years of secondary education, in which certain changes were introduced affecting the subjects and the number of hours given to them. The new plan was not put into force, and at present it is being re-examined, together with the syllabus for the fifth and sixth years of the *bachillerato*. Consequently the 1951 curriculum is still being applied.

Administration

Secondary education is organized and directed by the Ministry of Education acting through the divisions responsible for the particular branches of secondary education. The Ministry is assisted by the Higher Council for Education, whose duties include participating in the organization of education throughout the country, particularly as regards curricula and study programmes.

Textbooks may be freely selected by heads of schools, and educational authorities neither impose nor recommend them. In this matter, inspectors confine themselves to giving opinions on the textbooks which in the course of their visits they find in the hands of the pupils.

The Colombian Constitution gives the State supreme authority as regards the inspection and supervision of education. With respect to administrative matters, this supervision is generally carried out by the competent authorities of the Ministry of Finance and of the Office of the Comptroller General, through financial inspectors and auditors. The auditors must give their authorization for every type of expenditure under the budgets of official educational institutions. The treasurers and heads of the schools are responsible before the law for the utilization of all funds entrusted to them. This supervision is exercised throughout the territory of the Republic, with the co-operation of local and municipal authorities.

Private or independent bodies which maintain any type of secondary education for their own account and at their own risk are subject to supervision in accordance with the provisions of the Colombian legislation. Among such organizations is the Servicio Nacional de Aprendizaje (SENA) (the national apprenticeship service), which trains staff specially for business enterprises with funds contributed by such enterprises and with technical assistance from ILO and the United States Point IV programme.

Public educational authorities have always been able to maintain the best possible atmosphere of understanding and mutual support in their dealings with private institutions. Support at the national, departmental and municipal levels has generally taken the form of grants of funds and scholarships to educational establishments or the provision of premises and equipment.

Supervision and inspection. In all technical matters connected with education the Government exercises its supreme authority of inspection and supervision by means of national, departmental and local inspectors for all levels and branches of teaching.

The inspectorate was established in 1870, but was then confined to the departmental and municipal administrative levels. The increase in educational establishments and the need for state control gave rise to Decree No. 2114 of 1 December 1931 which established the National Inspectorate, whose duties were regulated by Decree No. 620 of 24 March 1936.

The inspection service constitutes the main connexion between the educational authorities and schools scattered across the Republic and is responsible for guiding and supervising instruction. In the performance of their duties the national and departmental inspectors give teachers practical advice for the successful performance of their tasks, and attempt to find remedies for the various difficulties impeding the proper functioning of the schools by enlisting the help of the competent heads of services, local authorities and other persons and bodies whose action could promote the interests of public education.

A 1938 decree divided secondary school inspectors into categories specializing in school organization, social studies, natural science, mathematics and languages. There are also inspectors of technical education, teacher training, rural education and physical training.

Attached to many secondary schools there is a parents' association (Asociación de Padres de Familia), which co-operates more or less effectively in educational matters with school heads. These associations do not generally concern themselves with financial or other school affairs which are not of a purely educational character.

Finance. Public educational establishments are almost entirely supported by the Government. The budgets of the national schools are determined by the Ministry of Education, and those of departmental and municipal public schools are prescribed by the competent local authorities.

In accordance with the national plebiscite of 1 December 1957, 10 per cent of the Colombian national budget must be set aside for education. The appropriation thus amounts to about 160,000,000 Colombian pesos, of which approximately 42,500,000 are assigned to national secondary education. In addition, each department and municipality in the country devotes a percentage of its own budget to education, with a special appropriation for secondary schooling.

In most public secondary institutions, the pupils pay enrolment or registration fees varying between 10 and 30 Colombian pesos, but otherwise public secondary education is free. Since most pupils in public institutions belong to the less prosperous social classes, the Government as a rule distributes a number of scholarships, worth 80 pesos each, which are awarded under a competitive system.

Secondary teachers' salaries are paid by the educational authorities in accordance with the Teachers' Establishment List laid down in Act No. 43 of 1945. The list divides teachers into four categories, the salaries for which have been revised periodically; Decree No. 10 of 1958 fixed them as follows: first category, 800 Colombian pesos per month; second 650; third 550; fourth 450; unclassified 450.

If a teacher is not resident in a boarding school, he receives a board allowance of 75 pesos. No teacher is normally required to work for more than 22 or 23 hours per week, and any hours in excess of this figure are paid at the rate of 10 pesos per hour if he belongs to the first or second category, and 6 pesos per hour if he belongs to the third, fourth or unclassified category.

All teachers are required to belong to the National Social Security Fund (Caja Nacional de Previsión) to which they pay a membership fee in one lump sum equivalent to a third of their monthly salary and thereafter 3 per cent of their salary every month. The National Social Security Fund gives assistance in case of termination and retirement, as well as medical assistance, subject to certain limitations.

Funds for building, maintenance and repair of school premises are derived from special allocations in the annual education budget. In 1959, this allocation was 2,025,000 Colombian pesos, distributed among the secondary institutions according to their needs. The Government makes special appropriations for building new schools. Likewise, every secondary school's budget has a special allocation for the purchase and maintenance of working equipment for study rooms, laboratories, library and teaching materials.

Buildings and equipment. In Resolution No. 30 of 1936, the Ministry of Public Health, in conjunction with the School Architecture Section, prescribed rules governing all school construction. Space, covered and open areas, heating and ventilation system, lighting, sanitary facilities and other requirements were all fully specified. The resolution also mentioned school furniture and equipment and the arrangement of laboratories and study rooms. These rules have gradually been applied and will be enforced in the new buildings to be put up; moreover, the premises unsuitable for teaching in which many schools now function will be renovated to comply with these principles.

School welfare services. All schools provide medical and dental services, but in cases of serious illness the family is responsible for obtaining medical attention. As mentioned above, the teaching staff is cared for by the National Social Security Fund, but certain restrictions are also placed on this service. An occasional institution has, at the initiative of its director, been furnished with a cafeteria for needy pupils, but there is no general system of school meals. It is intended to provide school psychological services as soon as funds allow.

TYPES OF SECONDARY EDUCATION

Secondary education, in the broad sense, may be considered as a continuation of primary school, an educational cycle with relatively independent purposes and at the same time a preparation for higher studies. In Colombia the term is understood to mean: 'the educational level, which presupposes the development, knowledge, habits and abilities that an adequate primary education should procure; which provides for young people between the ages of 12 and 19; and which is intended to give the pupil a general cultural background and to prepare him for the immediate exercise of an occupation useful to himself and to society or else for the efficient pursuit of higher studies'.

There is no systematic official or private organization in Colombia which helps to orientate pupils towards a particular branch of secondary education upon the conclusion of their primary schooling. Nor do parents receive guidance in this respect. Thus chance, whim, sporadic advice and many other obviously heterogeneous factors induce pupils to undertake secondary education, with the natural result that many mistakes are committed.

A very few types of complementary education are offered to pupils who have finished primary school, but none of this is systematic or subject to any general regulations.

By reason of the peculiar extension of the national territory all types of climate are to be found, including two different summer seasons. It has therefore been necessary to divide the country into two school sectors, involving difficulties for pupils who transfer from the one to the other: (a) the south-west sector, comprising three departments and one territory, has a school year beginning on the second Monday of October and ending towards 22 July of the following year; (b) in the central eastern sector, comprising the rest of the country, the school year begins on the second Monday in February and ends towards 22 November.

Both sectors have intermediate holidays, viz.: 8 days for Holy Week; in the central eastern sector, a period from 20 July to 7 August, and in the south-western sector, from 20 December to 7 January. Class is held from Monday to Friday, both morning and afternoon and Saturday morning, with an average of 7 periods a day.

The school year is divided into two semesters. There are partial examinations at the end of the first term and final examinations at the end of the second. Pupils who pass in all subjects complete their school year and move up to the next grade without further requirements; those who fail in one or two subjects are held back and must take a later examination to qualify in these subjects before being promoted; while those who fail in three or more subjects must repeat the grade.

The general secondary (bachillerato) *course*

For entrance to institutions of this type (*colegios*, *liceos*, *institutos*, etc.), the fifth year primary education certificate is required. The *bachillerato* course consists of 6 years at the end of which the pupil receives the diploma of *bachiller*.

The following table gives the compulsory minimum programme of study for all public and private *bachillerato* institutions, as laid down by Decree No. 0075 of 1951.

Owing mainly to the lack of well organized vocational guidance services, about 61.9 per cent of those who complete primary school go on to the *bachillerato* course.

The aim of the course is to inculcate, through the study of the scientific disciplines and the humanities, cultural qualities and knowledge which will express themselves in intellectual and reasoning capacity, in the practice of sound methods of investigation, in habits of analysis, synthesis and appraisal and in commendable personal attitudes of a social, moral and religious order. This general purpose involves two separate objectives: (a) to give pupils a

general education which, upon the termination of their secondary studies and irrespective of any career they may follow, will fit them to face whatever problems life may confront them with, including those calling for special technical knowledge; (b) to fit pupils with the knowledge, working methods and ability needed to engage in any university studies they may undertake.

Commercial education

The practical purpose of commercial education is to prepare skilled personnel for commercial activities in public and private undertakings.

The Commercial Education Section of the Ministry of Education was established in 1949; before that year these studies were under the guidance and control of the Department of Secondary Education. The urgently needed reorganization of commercial studies was carried out under Decree No. 686 of 1952 which was put into effect partly in 1933; it is now completely in force and has been willingly accepted by all schools.

The new programmes and standards developed in this country were studied at the Maryland Seminar in the United States of America and considered by the foreign experts in the commission to represent an excellent and novel system. The difficulties confronting Colombia in respect of commercial education had been common to all Latin America, and the solutions put forward may be of more than local interest.

Commercial education should have the following aims: to train individuals who are suited to commercial activities and private and public administration; to train business men who will be capable of exercising an effective influence on the country's economic development; to give the individual a general knowledge which will enable him to solve his own business difficulties and judge them in the light of economic conditions; to study, guide and develop interests and aptitudes with a view to the technical training of persons professionally engaged in any kind of commercial and administrative activity; to contribute to training for good citizenship.

In accordance with these aims, under the regulations in force since 1953 and now fully applied every effort is made to train efficient staffs for commerce, banking, industry, administration and other economic and financial operations.

Types of commercial education. The following forms may be distinguished:

1. General education with courses in typewriting, mechanical shorthand, secretarial work and commercial accountancy, courses for assistants and individual training.
2. Advanced education in commercial expert's and commercial technicians' courses.
3. University education for those who have passed the commercial technicians' course and gone through the 1-year course of specialized training (in banking, industry, official and fiscal accountancy and accountancy for co-operatives) or for holders of the secondary school leaving certificate who have taken a preparatory commercial orientation course and then, like the technicians, take the 2-year course for the *Licenciatura en Ciencias Económicas* (a first degree in economics) or the course comprising 3 years of advanced study for the *Contaduria Juramentada* (chartered accountant).

Courses for commercial experts and technicians may be taken subject to completion of the primary education or after several years of secondary studies.

'Compensatory' courses are those given in commercial schools based on regular secondary studies under the following conditions: (a) at the end of the second or third

year of the *bachillerato* course in an approved secondary school, a pupil may be enrolled in a commercial school and take an expert's course with the appropriate curriculum; (b) a pupil who has completed the fourth year of the *bachillerato* course, may take the commercial technician's course, with its corresponding curriculum as laid down in the above-mentioned decree.

If the pupils hold the certificate of *bachiller* they may take the higher commercial course which qualifies for admission to university studies.

The awarding of diplomas by unauthorized establishments has been prohibited and compliance with this rule strictly enforced. This decision was necessary to obviate the exploitation, fraud and abuses arising from the award to students of pompous diplomas which did not correspond to the studies carried out and which were conferred by some schools without official authorization. Commercial education correspondence courses were also made subject to regulation in order to prevent similar abuses and give the courses a more responsible character.

Specific standards have been established which must be complied with by new schools in order to obtain an operating licence and receive official approval. School heads and teachers must produce a good conduct record and comply with certain conditions of professional fitness. The system of contracts for courses has been abolished; in every case they must be charged and paid for monthly.

The Commercial Education Section of the Ministry is responsible for this work of regulation, guidance and supervision and is subordinate to the Industrial and Commercial Education Division which has a chief officer and only three inspectors, a very small number of officials in comparison with the immense and difficult task of supervising the more than 320 schools of this type.

Industrial education

This branch of secondary education covers all establishments which train pupils for a manual occupation or trade.

Act No. 143 of 1948 established categories for industrial schools and laid down the economic, social, religious, artistic and educational objectives of industrial schooling. It may, however, be seen that this legislation does not consider the possibility of establishing a new technical orientation or of solving the country's imperative needs. It has therefore been necessary to consider a complete reform of this branch of secondary education. Decree No. 0019 of 1957 enables holders of the diploma of *técnico* to enter the technical engineering faculties and this requirement takes the place of the classical *bachillerato*. Moreover, general educational legislation also covers industrial teaching.

Technical and industrial education is provided in the following types of establishments:

Escuelas artesanales (craft schools). They give a 2-year training course for artisans and are situated in less populated and underdeveloped areas.

Escuelas de artes y oficios (schools of arts and crafts). Their course, of 3 or 4 years' duration, is intended to give a medium degree of skill for workmen. They are situated in areas which are beginning to develop economically and are linked to the future industrial expansion of such regions.

Institutos técnicos industriales elementales (vocational schools for elementary technical and industrial training). Their 5-year course trains *expertos* in the various technical specialized branches required in industrial cities and areas. On completing the course pupils may after a period of practical work in industry, become principal foremen or supervisors. This type of school admits pupils who have completed the *bachillerato* course.

Institutos técnicos superiores (vocational schools for advanced technical training). Their 7-year course prepares pupils who have reached the preceding grade for their diploma as *técnicos*. These schools are situated in industrialized cities or areas. On completing the course pupils may become personal assistants to engineers and maintain a link with supervisors and foremen in factories and works.

In all, 28 schools of these types exist at present.

Such institutions, apart from subjects of general education, teach the following special industrial subjects: mechanics, aviation mechanics, automobile mechanics, motor engineering, electricity, radio technology, foundry work, industrial design, forging and welding, metalwork, civil construction, cabinet-making, topography, ceramics, carpentry, ironwork, tailoring and shoemaking.

About 4,000 pupils are enrolled in these schools, and some 350 pupils leave every year on completion of the courses in the various levels and branches.

Agricultural education

The purpose of agricultural education is to supplement primary schooling and enable young persons to make the best possible use of natural resources through work in rural areas.

Under Decree No. 2067 of 1954 a division of rural education was organized at the Ministry to deal with this branch of schooling. It is given in:

Escuelas vocacionales agrícolas (agricultural vocational schools), with a 1-year pre-vocational course and a vocational course of 2 years. Entrants are required to have completed primary education. The country now has 45 such schools with a total of 1,400 pupils and 215 teachers.

Escuelas anexas a normales agrícolas (schools annexed to agricultural teacher training schools), boarding schools for sons of settlers and for agriculture students.

Escuelas hogar para campesinas (rural home economy schools). Primary school must have been completed. The course lasts 3 years and leads to a certificate.

Cursos para campesinos adultos (courses for adults in rural areas). They are a stage of the agricultural vocational education programme intended for young persons and adults of rural areas who are engaged in agriculture. This is one of the most important sections of the programme as it helps the small farmer to find remedies for the difficulties encountered by him in his work as a farmer and stockbreeder and in his social life. There are now 63 of these courses, taught by 63 teachers, with a total of 4,000 pupils.

Teachers engaged in agricultural education are trained in the institutions described below. In the 44 rural normal

schools in 1959, there were 288 teachers and 1,400 students, of whom 19 per cent graduated.

Nursing schools

The division of the Ministry responsible for this type of education is at present concerned only with nursing schools of secondary level. For the *escuelas auxiliares de enfermería* (vocational training school for nursing assistants) completion of primary school is required. The course lasts 3 years and leads to the rural nursing assistant's diploma.

Artistic education

This education is intended to give training for all forms of the fine arts. It includes schools of music, schools of drawing and painting, sculpture, singing, choral societies and dancing schools.

Religious education

This covers education at secondary level in seminaries, novitiates and religious training institutions, which prepare young persons for the priesthood or for monastic life. In 1957, there were 57 such establishments, with 476 teachers and 4,866 pupils.

Unspecified secondary education

This term includes all establishments for specialized secondary instruction which do not have set curricula or a specified number of years of study and do not fall into any of the preceding groups. A total of 69 institutions with 489 teachers were attended by 15,188 pupils in 1957.

Teacher training schools

The teacher training branch includes all such institutions, for teachers of every level. The institutions at secondary level and those training secondary teachers are as follows:

The *escuelas normales para rurales* (rural teacher training schools) prepare schoolmasters for rural primary schools. Admission is subject to completion of primary education. The course lasts 4 years and leads to a diploma of *maestro para escuela rural.*

The *escuelas normales elementales* (training schools for primary teachers) also require the primary school-leaving certificate. They have a 4-year course and grant a diploma of *idoneidad pedagógica* (fitness for teaching).

The *escuelas normales superiores* (training schools for secondary teachers) require completion of a 5-year primary course. The courses last 6 years and lead to a diploma of *normalista superior.*

The *escuelas normales agrícolas* (training schools for teachers in agricultural schools) prepare teachers for the *escuelas normales rurales.* The entrance requirement is a primary school-leaving certificate. The course lasts 5 years and leads to a diploma of *institutor agrícola.*

The *institutos politécnicos superiores* (higher polytechnical schools) prepare teachers for the *institutos politécnicos complementarios* (vocational polytechnical institutes). The entrance requirement is a diploma of *experto.* The course lasts 2 years and leads to the diploma of *profesor* in the special subject specified.

The *escuelas normales industriales* (training schools for teachers in industrial schools) require the diploma of *experto.* The course lasts 1 or 2 years and leads to the diploma of *profesor industrial.*

The *universidades pedagógicas* (teacher training colleges) prepare teachers in general cultural fields for secondary institutions. These *universidades* are divided into specialized faculties. Admission is subject to possession of the *bachillerato* or the diploma of *normalista superior.* The course lasts 4 years and leads to the degrees of *licenciado* and *doctor.*

The *cursos de hogar* (home economy courses) prepare young women for the management of their homes and prepare teachers for manual and home economy activities in primary and secondary schools, in order to be enrolled, pupils must have passed the second stage of the *bachillerato* course and possess basic technical knowledge of the special subject they have chosen. The curriculum lasts 2 years and leads to a *certificado de idoneidad* (aptitude certificate).

The *escuelas de visitadoras de hogares campesinos* (schools for women rural visiting welfare workers) have the following requirements for admission: the pupil must be of a rural family, she must have completed the first year of the *bachillerato* course, and be at least 18 years of age. The course lasts 3 years, followed by 2 years of practical work. The diploma of *visitadora social de hogares campesinos* is conferred.

The *escuelas de cerámica* (ceramics schools) prepare teachers to direct pottery-making in primary and secondary schools and train staff in organizing this work in factories, workshops and studios. Pupils must have completed the third year of the *bachillerato.* The course, lasting 3 years, leads to the diploma of *técnico en cerámica.*

The *escuelas superiores de orientación rural femenina* (higher schools for rural, women's guidance officers) give specialized training for rural education. For admission, they require the diploma of *normalista* and 2 years of teaching experience. The course lasts 2 years and leads to the diploma of *técnica en educación rural.*

The *Escuela Nacional de Educación Física* (National Physical Education School) is intended to train physical education teachers and grants the following diplomas: professor of physical education for those who have had basic preparation leading to the diploma of *maestro superior* or to the *bachillerato* and have completed the 3 years' specialized course; gymnasium instructor, for those who have received basic training consisting of 4 years of the *bachillerato* course, the diploma of *maestro rural* or of *idoneidad pedagógica* and have completed the 2-year specialized course.

Decree No. 0192 of 1951, promulgated a study plan for teacher training institutions and various provisions dealing with teacher training. To the general subjects already required in other branches of secondary education were added subjects proper to the teaching profession, such as, pedagogy, general and special didactics, general and applied child and adolescent psychology, history of education, school organization and legislation, school teaching practice and the preparation of teaching materials.

Out-of-class activities

Many secondary school pupils are members of organizations such as the Boy Scouts, military bands and school orchestras, school theatre, scientific and academic associations, the Red Cross, etc. Sports are encouraged in all schools, especially basketball, football, tennis, baseball, swimming, etc. These activities form part of the special physical education programmes but also take on a greater extension.

TRENDS AND PROBLEMS

The Colombian educational structure, like that of many other countries, suffers from various defects, some of which are quite serious and must be rectified as soon as possible. For this reason, and in order to bring education up to the standard required by the country, the Ministry established an Office of Educational Planning with specific tasks assigned to it; in particular it was asked to make a general survey of Colombian education up to 1957 and propose a complete plan for education to be put into effect from 1958 onwards. As a substantial measure for the reform of education, Decree No. 1419 issued in 1958 conferred the character of 'pilot schools' on certain national institutions in the various branches of secondary education for the following purposes: to experiment with new curricula and methods and techniques; to communicate the results to other institutions belonging to the same level or type; to demonstrate systems of educational organization for the benefit of the teaching body; to organize brief courses and seminars for teachers of a particular subject in order to study methodological principles; to study draft curricula and programmes in the course of the first year of pilot school work, for the different branches of secondary education; to establish school and vocational guidance services under school psychologists; to consider all financial and pedagogic measures taken by the commissions responsible for guiding and supervising these schools. The following privileges have been granted to the pilot schools: priority in regard to the appointment of teaching staff selected for their personal, scientific and pedagogic capacity; an adequate supply of suitable general equipment and teaching materials, as well as a library for both pupils and teachers; priority in the allocation of funds for buildings, improvement and repairs. The 1959 budget assigned about 300,000 Colombian pesos to this type of school.

The general organization of the official pilot schools, the selection of their teaching and administrative staff, as well as the guidance and constant aid and supervision extended to them, are the responsibility of commissions, comprising the head of the competent division, national inspectors appointed by him, experts of the Ministry of Education's Planning Office and representatives of the heads of pilot schools.

The Ministry of Education may issue a resolution, granting the status of pilot school for a period of 3 years to any private institutions meeting the requirements laid down by the commissions appointed to study the request.

The Ministry of Education's Planning Office is responsible for the systematic appraisal of the results of the reforms or measures applied in such schools.

Since 1958 the *bachillerato* pilot schools (those for the technical, teacher training and agricultural branches have not yet been organized) have been trying out a new curriculum in which an attempt is made to reduce the number of subjects to a minimum; the pilot schools are thus given scope to experiment with the new study programmes and do more intensive work in the basic subjects.

The courses are divided into two cycles: (a) A fundamental cycle, lasting 4 years, for all types of secondary education and comprising the following subjects—religion, social sciences, natural sciences, mathematics, maternal language, English, physical education and various activities. The intellectual courses take 22 hours a week, physical education 2 hours and artistic and cultural activities 6 hours. During this cycle, the pupils will receive vocational guidance preparing them for the second cycle. No diploma of any kind is given at the end of the first period. (b) A second cycle, lasting 2 years (fifth and sixth classes) is directly devoted to the specific studies of each branch of secondary education and prepares the pupil for higher and university education. The subjects given in the second cycle are religion, philosophy, social sciences, physics and mathematics, chemistry, mother tongue, French, Latin and physical education. The pupils take 8 or 9 subjects per course, with 23 hours a week devoted to intellectual work, 1 to physical education and 6 to additional study in which they choose either science or literature for their *bachillerato* diploma.

In the second cycle, and particularly in the *bachillerato* course, pupils will receive vocational guidance preparing them for the proper choice of a career. The services will be given greater extension when the institutes of psychological studies and vocational guidance established by Decree No. 3457 of 1954 are organized and put into operation.

PROPOSED TIME-TABLE FOR PILOT SCHOOLS
(in periods per week)

	First cycle (year)				Second	
	1st	2nd	3rd	4th	5th	6th
Religion	3	3	3	2	2	1
Philosophy	—	—	—	—	4	4
Mathematics	5	5	5	5	5	3
Natural sciences	2	3	3	4	3	3

Spanish	5	5	5	4	3	2
English	3	3	3	3	—	—
French	—	—	—	—	3	3
Latin	—	—	—	—	3	3
Physical education	2	2	2	2	1	1
Activities	6	5	5	6	6	6

The pilot schools will continue to have this character until the end of 1961. The curricula and programmes with which they will have experimented, once the results are appraised, will be applied to all secondary educational institutions throughout the country.

As regards primary education, it is the government's

intention gradually to extend compulsory attendance to a sixth year. The new curriculum and programmes are being tried out; since the beginning of 1958, they have reached the experimental stage at 100 selected pilot schools scattered throughout the national territory.

In this manner, the Ministry is hoping to bring about a total reform of education at its first two levels; this will necessarily lead to the reform of higher and university education in the not too distant future.

[*Text prepared by Dr. Federico Arbelaez Lema, Secondary Education Expert at the Office of Educational Planning, and approved by the Colombian National Commission for Unesco in June 1959.*]

STATISTICS

Population (mid-year 1958 estimate): 13,522,000.
Area: 439,520 square miles; 1,138,355 square kilometres.
Population density: 31 per square mile; 12 per square kilometre.

Summary of school statistics, 1953–57. In the school year 1957/58, more than one and a half million pupils were enrolled in schools of all levels, from kindergarten to university. This figure does not include adults attending courses in evening schools, nor those receiving instruction by radio. The total enrolment in 1957/58 represented about 12 per cent of the population, as compared with 10 per cent in 1954/55 (see *World Survey of Education: II—Primary Education*). Of the 1,615,000 pupils, 89 per cent were attending kindergartens, primary schools and special schools; about 10 per cent were in secondary schools (general, vocational or teacher training); and less than 2 per cent in institutions of higher education.

The proportion of girls was about 49 per cent at the first level of education; 41 per cent at the second level; and 42 per cent at the third level. In the same edition of the *World Survey of Education*, the proportion of girls in higher education (not including teacher training institutions) was given as 16 per cent. The present high proportion of girls in higher education is due entirely to the inclusion of girls enrolled in teacher training colleges, who were previously not separated from teacher training at the secondary level.

In 1957/58 the total teaching staff numbered over 56,000, which represents an increase of about 43 per cent over 1953/54, while the total enrolment increased about 35 per cent during the same period. About 61 per cent of the teachers in 1957 were women. (See Table 1.)

Enrolment trends in secondary education, 1935–57. Between 1935 and 1957 total enrolment in general secondary schools increased more than three and a half times while enrolment in vocational schools more than doubled. Teacher training schools, combining those at secondary and higher levels, has shown a six-fold increase in enrolment between 1938 and 1957. The apparent irregularities in the figures for certain years, for example between 1945 and 1949, may be due to incomplete reporting rather than actual decline in enrolment. Nevertheless, the relatively less rapid development of vocational education as compared with general secondary education or teacher training may be shown by the fact that average enrolment in vocational schools, being about 39 per cent of total secondary enrolment for the period 1940–44, decreased to 29 per cent for the period 1955–57, while the proportion of general secondary enrolment increased from 54 to 62 per cent, and of teacher training from 7 to 9 per cent. (See Table 2.)

Examination results in secondary education. Available information for 1957 shows 5,175 pupils who passed the secondary school leaving examination (*bachillerato*); this number represents 4.8 per cent of all pupils enrolled in the general secondary schools for that year. There were 1,506 girls who passed the same examination, being 4.2 per cent of the total number of girls enrolled. The number of pupils enrolled in the last year of secondary school for the years 1953–56 represented between 5 and 7 per cent of the total enrolment in those schools.

Educational finance, 1957. In the fiscal year beginning January 1957, total expenditure for education amounted to 231 million pesos. The Central Government shared in this expenditure to the extent of 38 per cent, the provincial governments 49 per cent, and the local authorities 13 per cent (see Table 3). Total recurring expenditure, which constituted 92 per cent of the total expenditure, was distributed by level and type of education as shown in Table 3C.

COSTA RICA

THE EDUCATIONAL SYSTEM

Part VII of the 1949 Constitution, relating to education and culture, contains the following Articles:

Article 77. Public education shall be organized as an integral process correlated in its various phases, from the pre-primary to the university stage.

Article 78. Primary education shall be compulsory and, together with pre-primary and secondary education, shall be free of charge, the cost being borne by the State.

The State shall facilitate the pursuit of higher studies in the case of persons of inadequate financial means. The Ministry of Education shall award the requisite scholarships and grants through such organs as the law shall prescribe.

Article 79. Freedom of teaching shall be guaranteed. Nevertheless, all educational centres shall be subject to supervision by the State.

Article 80. Private initiative in education shall be encouraged by the State in such manner as the law shall prescribe.

Article 81. Public education shall be under the general direction of a Higher Council, constituted in accordance with the law, under the chairmanship of the Minister of Education.

Article 82. The State shall provide food and clothing for indigent pupils in accordance with the law.

Article 83. The State shall sponsor and organize adult education designed to eradicate illiteracy and provide cultural opportunities for those desirous of improving their intellectual, social and economic situation.

Article 84. The University of Costa Rica is an institution of higher education; it shall be independent in the performance of its tasks and shall have full legal capacity to acquire rights and contract obligations, as well as to determine its own form of organization and management.

Article 85. The State shall endow the University of Costa Rica with its own resources, providing it with the necessary revenue and contributing to its maintenance with a sum equal to at least 10 per cent of the annual budget of the Ministry of Education, to be paid in monthly instalments.

Article 86. The State shall train teachers at special institutions and at the University of Costa Rica.

Article 89. The cultural aims of the Republic shall include the protection of its natural beauties, the preservation and development of the nation's historical and artistic heritage, and the support of private initiative for scientific and artistic progress.

Article 67 of Part V of the Constitution reads as follows: 'The State shall ensure the technical and cultural training of the workers'.

Article 121, sub-paragraph (19), Part IX of the Constitution, defines the powers and duties of the Legislative Assembly, and prescribes that the Assembly shall: 'Establish institutions for the teaching and advancement of the arts and sciences and supply them with the necessary income for their maintenance, and, shall in particular, promote the general extension of primary education'. The structure of the Costa Rica school system is shown in the diagram on p. 387.

THE DEVELOPMENT OF SECONDARY EDUCATION

Before 1886 the Costa Rican school system consisted of two institutions which were clearly defined by the laws and which were deeply rooted in the national traditions: the primary school and the Universidad de Santo Tómas de Costa Rica. When a pupil had completed his primary studies he could continue his education at the university, which had two fundamental aims: to provide preparatory courses for adolescents, and university courses proper for those studying for the various professions. At that time, there was no specially organized system of secondary education, with its own study plans and curricula, designed to continue the educational process begun at the primary schools.

When Mauro Fernández became Minister of Education in 1886 he proposed a plan for building a school system which would consist of three successive levels or stages corresponding to the three phases in the development of the young, namely primary education, secondary education and university or vocational education. Each of these stages was to achieve a specific purpose, and the system as a whole, providing the children and the youth of the country with a complete training from kindergarten to university, was to be of such a character as to promote the full development of the human personality.

The result of his efforts was a Public Education Bill, which was promulgated as an Act of the Congress of the Republic in 1886. This law not only laid down the principles by which the Costa Rican school system was to be governed but also the administrative structure of the school system as a whole, from the humblest village school to the *liceos* (secondary schools). The great merit of the Public Education Act of 1886 was to give the Costa Rican schools an orderly and coherent system and to introduce uniformity into its structure, aims and administration. The structure of secondary education (formerly known as *segunda enseñanza*, but now called *enseñanza media*) was of fundamental importance to Costa Rica, a country consisting of predominantly agricultural communities. The *liceo* was divided into cycles (*ciclos*) and sections (*secciones*) and offered the youth of the country a variety of opportunities. There was a classical section which trained pupils who revealed an aptitude and inclination for the liberal professions and intended to continue their studies at the university, a technical section, a commercial section, and a teacher training section. The *liceo*, in the form just described, corresponded to the country's needs at that time.

In 1887, the Government of the Republic opened the first institution of secondary education to be established in accordance with these principles—the Liceo de Costa Rica. Two others were opened the following year—a girls' school in the capital, the Colegio Superior de Señoritas, and the Instituto de Alajuela in the town of Alajuela. The Colegio de San Luis Gonzaga had been open since 1869 in the town of Cartago. Thus, for many years, two secondary schools existed in the capital and two in the provinces.

The Liceo de Costa Rica, as an educational and social institution, played an important part in the spiritual and civic training of young people, and the reform introduced by Mauro Fernández can be regarded as one of the most important events in the history of Costa Rican democracy. Nevertheless, with the continual growth of the community and the transformation of the economic and social situation there arose a lack of balance and proper adjustment between the theories on which education had been based and the style and methods of teaching on the one hand, and the needs and interests of the country's youth and of the nation on the other.

During recent years, while all other aspects of the national life have progressed at a rapid rate, secondary education has remained stationary and its shortcomings have become increasingly evident from year to year. For some considerable time now, teachers and numerous members of the general public have emphasized the need to make radical changes in its foundations and structure. Successive governments have endeavoured to make a detailed analysis of the causes of the problem, but there has been a lack of technical bodies sufficiently qualified to carry out objective scientific research into the Costa Rican school system as a whole.

From 1948 on, radical changes were made on the occasion

of the promulgation of the 1949 Constitution, which replaced that of 1871. The Constituent Assembly wished to profit by such an important legislative occasion in order to lay down certain standards of a very general nature, with a view to promoting the reform of education, particularly secondary education.

The text included in the 1871 Constitution shows that the prevailing idea at that time was to ensure public primary education for all Costa Rican citizens. Article 77 of the 1949 Constitution, already referred to, goes much further as it emphasizes, in the light of contemporary educational ideas, three aspects of the highest importance: the nature of the educational process, the division of school education into stages, and the urgent need to correlate these stages.

The constitutional principle that education is a process renders it necessary to reform the school system in Costa Rica.

Article 77 of the Constitution called for new legislation to replace the old statutory measures which went back to the Act of 1886. On 14 September 1957, the Legislative Assembly approved the Fundamental Law on Education, the outcome of a long and detailed report prepared by the Higher Council of Education. This Law contains the following Articles relating to secondary education:

Article 14. Secondary education shall comprise all institutions and means designed to meet the general and vocational educational needs of young persons; its aims shall be as follows:

(a) To contribute to the formation of the personality in an environment favourable to the physical, intellectual and moral development of the pupils.
(b) To inculcate in pupils a conception of the world and of life in accordance with the ideals of universal culture and Christian principles.
(c) To develop the powers of reflection so as to enable the pupil to analyse moral, aesthetic and social values, to arrive at a rational solution of the various problems and promote the advancement of culture.
(d) To prepare pupils for civic life and the responsible exercise of freedom, by providing them with an adequate knowledge of the national institutions, as well as of the country's social and economic needs.
(e) To guide adolescents in acquiring general culture, including the knowledge and values which are necessary to enable them to find their way among and understand the problems raised by their social environment.
(f) To develop the abilities and aptitudes of adolescents in order to help them to orientate their studies towards a particular profession or vocational activity.

Article 15. Studies at the secondary level shall last at least 5 years and shall be organized in accordance with a co-ordinated programme comprising: (a) a core course of general culture; and (b) variable and supplementary courses of an exploratory nature, designed mainly to discover aptitudes and to develop interests.

Article 16. With a view to the better co-ordination of study plans and the distribution of subjects, secondary education shall consist of two cycles: (a) A basic general cycle, intended to develop the pupil's personality; during this stage, preference shall be given to general education together with a number of additional subjects and activities designed to discover the pupil's aptitudes and interests. (b) A second cycle, which will continue the general studies begun during the first stage and intensify, in accordance with variable plans, the development of the pupil's needs and interests. The duration of each cycle shall be fixed by the Higher Council of Education, with due regard to the nature and aims of each stage.

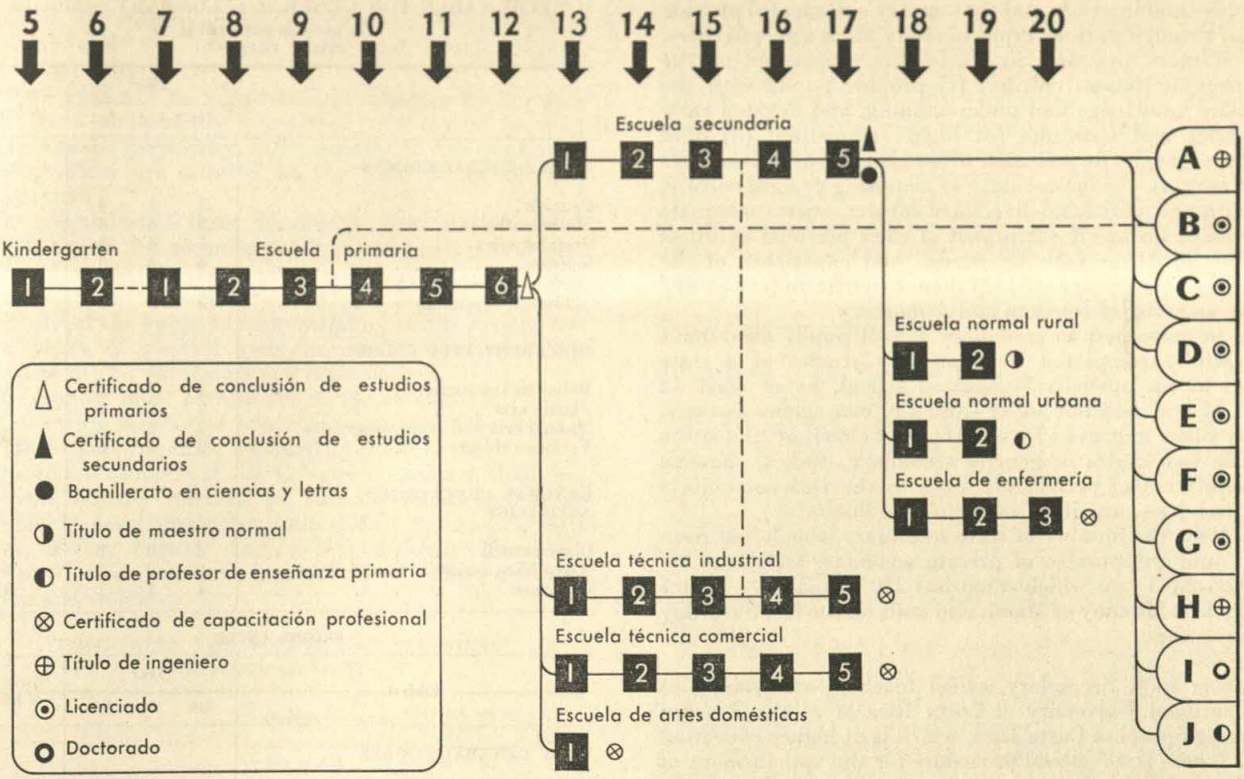
Article 17. Technical education shall be provided for those desirous of following secondary vocational courses which are open only to those who have completed their primary education or a part of their secondary education. The duration of such courses and the corresponding study plans shall be fixed by the Higher Council of Education according to the country's needs and the nature of the various trades and professions.

In addition to the technical education mentioned in the preceding paragraph, special apprenticeship courses shall be organized, subject to the approval of the Higher Council of Education.

Article 18. The study plan shall comprise three types of courses and activities: (a) general courses; (b) vocational courses; (c) activities of social, moral and aesthetic value.

Administration

All educational establishments are subordinate to the Ministry of Education. Secondary schools enjoy a considerable measure of independence; the headmasters co-operate closely with the administrative council (municipal or state) established for each school by a government decree.



There are also private secondary schools, which unless officially recognized are not authorized to confer the certificate of *bachiller* (school leaving certificate).

The supervision of secondary education is ensured by two inspectors of secondary schools and teacher training schools and an inspector of private secondary schools, all of whom are appointed by the Ministry of Education. The headmasters ensure liaison between the inspectors and teachers.

During the last 10 years, the efforts to reform secondary education have been considerably intensified. The successive governments have signed agreements with certain international organizations with a view to obtaining the services of groups of experts for the purpose of aiding Costa Rican educators to study the country's educational needs and to solve the most urgent problems. Money and trained staff are the only things needed in order to initiate the reform of secondary education.

TYPES OF SECONDARY EDUCATION

The aims of the first cycle of secondary education are: (a) to provide Costa Rican youth with a basic general culture designed to develop their personalities; (b) to promote the discovery and development of the pupil's aptitudes and interests and to satisfy his needs; (c) to promote the training and development of good habits (useful norms of individual and social conduct) and the development of critical thought and the powers of reflection; (d) to provide 'pre-vocational' training which takes

GLOSSARY

escuela de artes domésticas: vocational training school of cooking, dressmaking and homecraft.
escuela de enfermería: vocational training of nursing school; ordinary 3 year course leads to qualification as trained nurse, with a further 6 months' specialization for qualification as midwife.
escuela normal rural: teacher training college for teachers in rural schools.
escuela normal urbana: urban teacher training college.
escuela primaria: primary school.
escuela secundaria: general secondary school.
escuela técnica comercial: vocational secondary school of commerce.
escuela técnica industrial: vocational secondary school preparing for entry into industrial occupations.
kindergarten: pre-primary school.

HIGHER EDUCATION

A. *Agronomía:* agronomy.
B. *Bellas artes y música:* fine arts and music.
C. *Ciencias:* science (physics, chemistry and biology).
D. *Ciencias económicas:* economic and social sciences.
E. *Derecho:* law.
F. *Farmacia:* pharmacy.
G. *Filosofía y letras:* philosophy and letters.
H. *Ingeniería:* engineering (civil).
I. *Odontología:* dentistry.
J. *Pedagogía:* education.

EXAMINATIONS

bachillerato en ciencias y letras (baccalaureate of science and letters): university entrance examination.
certificado de capacitación profesional certificate of vocational competence.
certificado de conclusión de estudios primarios: primary leaving certificate.
certificado de conclusión de estudios secundarios: secondary leaving certificate.
doctorado: doctorate.
licenciado (licentiate): university degree approximately equivalent to bachelor's degree in English-speaking countries.
título de ingeniero: qualification as engineer.
título de maestro normal: qualification as primary teacher without *bachillerato en ciencias y letras* (*q.v.*) or university degree, but having completed course at training college.
título de profesor de enseñanza primaria: qualification as primary teacher with teacher training based on *bachillerato en ciencias y letras*, or university degree.

account of individual differences and facilitates access to other types of secondary education; (e) to develop a civic spirit and an understanding of the fundamental values which constitute the foundation of the cultural, moral and practical life of the Costa Rican community and of the world in general.

As regards the second cycle, the various types of secondary education must be conceived and organized in such a way that they are linked with the first stage and, through flexible study plans, facilitate the transition from one type to another. They are designed to (a) ensure the vocational training of the young, with due regard to their

aptitudes and interests and the country's needs; (b) provide pupils, through various types of study plans and activities, with a more practical and scientific knowledge of the branches of human culture; (c) provide pupils with the requisite knowledge and understanding, and develop their capacities and aptitudes for higher education; (d) offer pupils, through the inclusion of a common core of subjects (*plan común*), the opportunity of acquiring general culture, and, through additional diversified subject courses, adequate experience for the development of their personal abilities; (e) provide them with knowledge and experience of the life of the country so as to help them to a true understanding of the meaning of freedom and democracy.

To be admitted to secondary school pupils must have successfully completed their primary studies at a state school or an officially recognized school, be at least 12 years of age, and not suffer from any contagious diseases. Study plans approved by the Higher Council of Education for the two cycles of general secondary studies, showing the allotment of periods per week to the various subjects and activities, are given in the next column.

In 1960, the number of state secondary schools had risen to 31 and the number of private secondary schools to 29.

The school year which comprises 210 school days, begins on the first Monday of March and ends on the last Saturday of November.

Teaching staff. Secondary school teachers are trained at the National University of Costa Rica or at the Teacher Training School of Costa Rica, which is at higher education level. There is no special procedure for the appointment of teachers. Under the existing laws, students who obtain the *licencia* (diploma) of the Faculty of Letters are, *ipso facto*, state teachers and officials. At a large number of secondary establishments, the teachers are chosen among primary school teachers.

Vocational and technical schools

The Ministry of Education has a Vocational Education Section, attached to the Inspectorate-General of Secondary Education; it is responsible for the technical and administrative direction of vocational secondary schools. This section co-operates with the Higher Council of Education in the organization of the study plans and curricula. It is under the direction of a chief official and is advised by a National Board of Vocational Education, consisting of representatives of the various organizations and institutions—state, independent, private—concerned with this type of education.

Until the end of 1956, vocational education had been provided exclusively at independent or private institutions, which offered excellent opportunities to young persons desirous of acquiring technical skill in the various trades; some of these schools received financial support from the Government. Nevertheless, the Ministry of Education considered it advisable to establish a national system of vocational secondary schools and drew up a plan for the establishment of schools of this type in various parts of the country. In 1959 the following were conducted as a part of the national school system subordinate to the Ministry of Education: the Colegio Vocacional Monseñor

Sanabria, at Desamparados; the Colegio Vocacional, at Heredia; and the Colegio Vocacional Carlos Manuel Vicente, at Golfito.

To be admitted to vocational secondary schools pupils must have successfully completed the 6-year primary course and be physically and mentally fit for vocational training. They are selected on the basis of an entrance examination.

The course lasts 5 years. During the first year, the basic general course for secondary schools is taught, and provision is made for exploring vocational interests and aptitudes. From the second to the fifth year, pupils continue the study of the subjects corresponding to the second and third years of general secondary education, and also specialize in the vocational activities chosen.

The courses must correspond to the community's needs and so every vocational education plan must be flexible enough so that it can be adapted to those needs.

The courses taught at the Colegio Vocacional Monseñor Sanabria, already referred to, may be mentioned as an example: general mechanics, automobile mechanics, electricity, radio, casting and model making, plumbing, carpentry and cabinet-making, metal-plate working, forging and welding.

The private vocational schools conducted in the country are of three different types: technical schools, commercial schools and dressmaking schools.

The Colegio Vocacional de Artes y Oficios (Arts and Crafts School) at Cartago, for instance, is open to primary school pupils. Its study plan includes courses in general culture, co-ordinated with activities at the following workshops: general mechanics (forging, fitting and turning); cabinet-making; typography; tailoring; automobile mechanics and preparatory courses in electricity. During the first year pupils work in the various workshops in turn, and during the second year they specialize in a trade. On completing their studies, they receive a skilled worker's certificate.

Teacher training schools

In addition to the Teacher Training School of Costa Rica, which has been training teachers since 1914, two new state centres have been established, one at Guanacaste (Decree No. 369 of 8 February 1949) and the other at San Ramón (Decree No. 1 of 24 March 1952). These two centres are rural teacher training schools.

Since 1957, persons applying for admission to these schools, which provide a 2-year course of training, must hold the diploma of *Bachiller en Ciencia y Letras*, that is they must have completed the 5-year course in secondary studies.

For the holders of this certificate already engaged in teaching, two special courses were instituted one in the province of Heredia, and the other at Cartago, both being organized by the Teacher Training School of Costa Rica. The course at Heredia is an evening school, while that at Cartago is an extra-mural course. The latter is given during three summer periods, each lasting 8 weeks, and on 72 Saturdays, comprising two separate courses.

The Instituto de Formación Profesional del Magisterio (Teacher Training Institute) was established by Law No. 1963 of October 1955. Its fundamental task is to improve the training of uncertificated teachers, i.e. persons who are employed in teaching in schools but have not been trained at the Escuela Normal (Teacher Training School) or at the former Faculty of Pedagogy. Its study plan covers 6 years, divided into two 3-year stages. During the first stage, the pupil receives a basic general training and the second stage is reserved for teacher training.

In addition to the above-mentioned institutions, there is the School of Education, which depends on the university and which is also devoted to the task of training more and better teachers.

[*Text based on official publications and on a report prepared in April 1960 by Abelardo Bonilla Baldares, Minister of Public Education.*]

STATISTICS

Population (mid-year 1958 estimate): 1,076,000.
Area: 19,653 square miles; 50,900 square kilometres.
Population density: 55 per square mile; 21 per square kilometre.

Summary of school statistics 1953–57. Total enrolment in all educational institutions from primary schools to university colleges was nearly 204,000 in 1957, representing about 20 per cent of the population. There were, in addition, over 1,500 people attending adult education courses. Of total school enrolment, about 85 per cent were in primary and pre-primary schools, 10 per cent in general secondary schools, over 3 per cent in secondary technical schools, 1 per cent in all teacher training courses and 1 per cent in the university. Girls made up just under half the enrolment in primary and general secondary schools, nearly three-quarters of the enrolment in all teacher training schools, and 40 per cent at the university. The teaching staff at all institutions, including adult education, numbered 8,931 in 1957, of whom 78 per cent were women. The pupil-teacher ratio in primary schools was 23, compared with 25 in 1953. In general secondary schools the ratio was 18 in 1957. Compared with 1953, enrolment had increased by 27 per cent in primary and by 65 per cent in general secondary schools. Enrolment in teacher training courses at the secondary level increased by over 150 per cent between 1955 and 1957 and trebled at higher teacher training colleges between 1953 and 1957. At the University of Costa Rica, enrolment increased by 32 per cent over the period under review. (See Table 2.)

Enrolment trends in general secondary education 1940–57. Between 1940 and 1957, average enrolment in general secondary schools increased almost six-fold. The ratio obtained by relating the enrolment in these schools to the estimated population aged 15–19 years rose from 4 in the 5 years 1940–44 to 17 in the period 1955–57. (See Table 3.)

Examination results in secondary education 1953–57. The number of students awarded the diploma of *Bachiller en Letras y Ciencias* at the end of their general secondary studies increased by 29 per cent (from 786 to 1,016) between 1953–54 and 1957/58. Over half the successful students were girls in both years.

Educational finance, 1957. Expenditure on education by the Central Government amounted to 80,394,230 colons in 1957, representing approximately 78 colons per inhabitant. Of this total, some 9 per cent was for capital expenditure. (See Table 1.)

CUBA

EDUCATIONAL POLICY OF THE REVOLUTIONARY GOVERNMENT

Antecedents

At the outset of the Republic, secondary education was organized in a form satisfactory for the period. Subsequently it failed to develop in response to national needs and the progress of educational theory. Despite occasional efforts to plan and reconstruct secondary schooling a large number of defects were evident when the revolutionary Government was established on 1 January 1959. These may be summarized as follows:

1. Irrational distribution of funds for education, by which some establishments were over-endowed and others so poorly that they could not function properly.
2. Proliferation of the *centros oficializados*, that is, private secondary schools recognized as official by the Government.
3. Lack of proper articulation of secondary education, both vertically with primary and higher education and horizontally between the different types of school.
4. Lack of definition of the specific objectives of general and vocational secondary education.
5. Absence of educational and vocational guidance for the young.
6. Lack of an organized system of secondary school inspection for the guidance, certification and assessment of teachers.
7. Inadequate system for assessing and promoting students.
8. Poor textbooks and lack of teaching materials and supplies.
9. Insufficient health and psychological services for the students.
10. Unsatisfactory civic education, since this tended to be treated as a subject to be taught, rather than as an aspect of the educational process.
11. Faulty conception of the teacher-student relationship and an out-of-date approach to questions of discipline.
12. Insufficient preparation of teachers.

Present policy

The Ministry of Education has mapped out its policy along two main lines:

1. Restoration of the principle of correct procedure in technical and administrative matters and consolidation

of public integrity, as re-established by the Revolutionary Government. In pursuing this objective, Law No. 13 of 22 December 1951 was taken as the starting point. Any action since that date in infringement of the law's prescriptions was declared null and void; in addition, a series of ministerial resolutions were issued to restore correct procedure.

2. Execution of a practical four-point programme: (a) extension and improvement of existing educational services; (b) decentralization of the technical and administrative functions of the Ministry of Education; (c) technical reorganization of the Ministry and its services; (d) complete planning of education, with short, average and long-term curricula in keeping with required priorities.

In accordance with this educational policy, the most important measures adopted in connexion with secondary education are as follows.

Ministerial Resolution No. 7700 of February 1959 governs admission through technical aptitude tests, to the teaching profession in general and vocational secondary schools.

Ministerial Resolution No. 7701 of February 1959 and annexed provisions, nullify the many violations of the law governing admission to the teaching profession through technical aptitude tests (Law No. 13 of December 1951) and require compliance with the provisions concerning the minimum number of working hours for teachers (12 hours a week) and the ratio of 1 teacher to 50 pupils.

Laws Nos. 76 and 367 of June 1959, together with their regulations, bring the secondary schools in every province under the immediate management, guidance and supervision of new Provincial Departments of Education, each with its own director and two assistant directors and a body of inspectors and specialists in educational guidance and psychology. This new system is also the first stage in establishing a link-up between the primary and secondary school levels in Cuba.

Law 203 of March 1959, establishes security of tenure for state, provincial and municipal officials and those of autonomous bodies and brings financial benefits on termination into line with the Civil Service Law.

Law No. 290 of April 1959 regulates the procedure for selecting the heads and assistant heads of secondary schools from a short list of three candidates.

Decree No. 1411 of May 1959 governs the procedure for promotions and appointments of secondary school teachers to fill vacancies occurring in such schools, in conformity with Law No. 13 of 1951.

Resolution No. 12026 of March 1959 appoints a commission for the revision of textbooks used in secondary and vocational education, in order to ensure that the latter meet the State's main requirements, such as: appreciation of the country's geographical, historical, civic and aesthetic characteristics; knowledge of major national problems which it is important to impart to children and young people; development of the right trends in education; and above all, inculcation of a civic sense.

Resolution No. 7988 of March 1959 appoints a commission to study the problem of schools operated by foundations, the idea being to determine, through careful appraisal of demographic, academic and sociological factors in general, whether there is any justification for having various types of secondary schools or founding new ones in Cuba.

Resolution No. 16055 of June 1959 sets up commissions to review the objectives and methods of the courses given in general and vocational secondary schools, their minimum content and the textbooks used.

Resolution No. 16877 of June 1959 appoints a commission to study, on the basis of the needs of the various regions and communities, the best way of distributing the technical schools which the Revolutionary Government proposes to establish and the speciality to be assigned to each, according to the particular features of the territory which it is to serve.

Law No. 445 of July 1959 enforces the creation of Provincial Departments of Education, provides for increases in allocations for workshop equipment, library services and general teaching materials, and abolishes the practice of having two budgets (the regular and extraordinary budgets)—a source of corruption through excessive increases in individual posts or public services.

Resolution No. 580 of August 1959 concerns technical aptitude tests for the selection of candidates for vacant posts, or those due to fall vacant, in the administrative services of the Ministry of Education and its Departments, the idea being to ensure that appointments to administrative posts in the Ministry are made in accordance with strict scientific criteria and that the Ministry achieves the highest possible standards of efficiency.

Law No. 559 of September 1959 (law on the adjustment and modernization of the educational system, pending the general reform of education) provides, for the first time in Cuba, for the following measures:

1. Establishment of a Teachers' Council (*Consejo Técnico de Profesores*) for each school, composed of the senior teachers of the various subjects and presided over by the head of the school; the council's duties are to appraise the educational work done in the institution and examine all aspects of its operation systematically.
2. Formation of Student Councils (*Consejos Estudiantiles de Curso*) comprising groups of students and teachers who are responsible for planning and carrying out programmes of civic, social and cultural education related to the problems of the school, the local community and the nation, and taking account of current social, political and economic changes in Cuba.
3. Introduction of a system of semester courses: the academic year is to be divided into two courses of four and a half months, the purpose being to limit the number of subjects studied during each course so that pupils are not overburdened with a quantity of subjects which must be taken for a whole year.
4. Introduction of a new system for judging pupils' progress, based on examinations at regular intervals, class work and a final test of ability to apply knowledge; the object is to purge the educational system of learning for examination purposes.
5. Creation of a body of technical inspectors of secondary and vocational schools to supervise secondary school teachers, give them educational and scientific guidance and estimate the value of their work in their own particular subject or subjects.
6. Establishment by the official state universities of training colleges for secondary school teachers (*escuelas superiores*

del profesorado secundario), who are required to complete a course at these colleges in order to qualify as teachers at the secondary school level.

7. Creation of national registers by subject, for transfers and promotions of secondary school teachers and admission to the secondary school teaching profession.
8. Establishment by the official state universities of pilot secondary schools, annexed to the training colleges for secondary school teachers.
9. Introduction of security of tenure for teachers, subject to revision every five years, with a scale of merits and demerits, in order to prevent incompetent teachers from being appointed for life.

Following this law, Resolution No. 1210 of September 1959 lays down rules for the compilation of the Official Register of Teachers.

Resolution No. 754 of September 1959, announces technical aptitude tests for the selection of candidates to fill vacant teaching posts in secondary and teacher training schools, and replaces the old system of competitive examinations held sporadically (written exercise lasting 4 to 6 hours, oral examination on the curriculum, etc.) by an appraisal of merits based on the candidates's studies and professional experience and on three new types of exercise: a practice class, a written paper of not more than 500 words on aspects of national problems and a 20- to 30-minute interview on the interrelationship between society, culture and the school.

Decree No. 2080 of October 1959 assigns quotas for admission to secondary school teacher training colleges with limited enrolments, as a means of controlling and planning admissions and promotions in accordance with the country's needs.

Resolution No. 4160 of October 1959 announces the establishment of 31 posts of technical inspectors, to be filled through competitive technical aptitude tests, as prescribed under existing legislation.

Resolution No. 15345 of June 1959, with its attendant provisions, appoints a Technical Commission of the Ministry of Education to make surveys and studies with a view to planning and carrying out a general reform of education.

The Commission has submitted a report on its studies and surveys of the country's educational situation, together with corresponding statistical estimates serving as a basis for the 'Educational Message to the People of Cuba' announced by the Minister of Education.

The Technical Commission has also submitted proposals concerning the basis and general pattern of the complete reform of education, and a general plan for the technical reorganization of the Ministry of Education, including the office or board of educational planning.

The membership of this commission has since been broadened to include specialists from the civil service and the teaching profession, the purpose being to define the basis and general outline of the transitional curricula as well as new requirements under the plan for educational reform.

Resolution No. 567 of September 1959 suspends the beginning of studies in public upper primary schools, in order that they may be reorganized and converted into 'basic secondary schools', in accordance with the recommendations of various national and international seminars of educators and government representatives. This resolution announces that a public conference (*información pública y forum*) will be convened prior to the introduction of general educational reform by the draft Organic Law on the national educational system of Cuba (November-December 1959).

STATISTICS

Population (mid-year 1958 estimate): 6,466,000.
Area: 44,218 square miles; 114,524 square kilometres.
Population density: 146 per square mile; 56 per square kilometre.

Summary of school statistics, 1953–1956. Total enrolment in educational institutions at all levels was 892,678 students in 1956/57, representing about 14 per cent of the population. There were in addition some 28,000 adults enrolled in night schools. Of the school-going population, nearly 91 per cent were enrolled in pre-primary and primary schools, 4 per cent in general secondary, 2 per cent in vocational and 1 per cent in secondary teacher training schools. The remaining 2 per cent of those enrolled were attending university and higher teacher training courses. Girls made up over 50 per cent of enrolment at pre-primary and primary schools, 42 per cent at general secondary schools, 92 per cent at secondary teacher training courses

and over 50 per cent at the universities. Excluding part-time teachers, numbering over 7,350 in 1956/57, the teaching staff in primary schools was 21,066 of whom 85 per cent were women.

The full-time teaching staff at all levels of education from primary schools to universities was nearly 27,200 in 1956/57, an increase of 16 per cent over 1953/54.

The average pupil-teacher ratio in primary schools (excluding part-time staff) was 35 in 1956/57 against 39 in 1953/54; in general secondary schools the average ratio was slightly higher at 18 than at the beginning of the period under review. Compared with 1953/54, enrolment increased at all major levels of education with the exception of pre-primary schools and university colleges. The increase in enrolment in primary schools was 3 per cent, in general secondary schools 19 per cent, in secondary vocational schools 29 per cent, in teacher training schools 14 per cent. At university level, however, enrolment fell by 17 per cent compared with 1953/54 and by 30 per cent compared with the preceding year, 1955/56. (See Table 2.)

Examination results in secondary education, 1953–56. As shown in Table 3, diplomas are awarded in all aspects of secondary education, from general secondary schools to teacher training courses. The number of certificates awarded in 1956/57 was 6,565 of which 54 per cent to women candidates. The corresponding number of diplomas granted in 1953/54 was 5,863. Diplomas awarded by commercial schools nearly doubled over the period under review, teaching diplomas increased by 14 per cent and technical and trade schools certificates by 24 per cent. There was, however, a decline in the number of students awarded the general secondary schools diploma and the diploma of home economics schools in 1956/57 compared with 1953/54.

Educational finance, 1957/58. Total expenditure on education for the year 1957/58 was 78,552,951 pesos representing approximately 12 pesos per inhabitant. Of the total spent, about 5 per cent was for capital expenditure; the distribution of recurring expenditure by level and type of education is given in Table 1B.

CZECHOSLOVAKIA

THE EDUCATIONAL SYSTEM

The Constitution of the Czechoslovak Republic, adopted on 9 May 1948, contains the following provisions relating to teaching and education:

'1. Every citizen shall be entitled to education.

'2. The State shall ensure that every person shall receive an education and training commensurate with his aptitudes, bearing in mind the needs of the community.' (Article 12.)

'1. All schools shall be state schools.

'2. Basic school instruction shall be uniform, compulsory and free.' (Article 13.)

'1. Education and teaching shall be in conformity with the findings of scientific research and shall not be at variance with the system of people's democracy as a form of government.

'2. Supreme authority and supervisory powers over education and teaching shall be vested in the State.' (Article 14.)

In Czechoslovakia, teaching is given in Czech or Slovak, or in the languages of the national minorities living in the Republic (Polish, Ukrainian, Hungarian).

All citizens have equal access to education and to all professions and occupations.

All schools are state schools; the establishment of denominational schools is forbidden. Religious instruction is provided throughout the period of compulsory education, but only to children whose parents have made a request to that effect.

Education is under the exclusive control of the Ministry of Public Education and Culture, except in the case of a few technical schools coming under the direction of the Ministries of Public Health and of Agriculture and Forestry. With a view to simplifying public administration, all matters connected with education in the regions and districts have been decentralized and placed under the education and culture sections of the district or regional national committees.

The diagram on page 399 shows the structure of education in Czechoslovakia.

THE DEVELOPMENT OF SECONDARY EDUCATION

When it was established in 1918, the Czechoslovak Republic inherited the school system of the former Austro-Hungarian Empire. Primary schools were open to children between 6 and 11 years of age and upper primary schools to children between 11 and 14. The period of compulsory education

began with the school year following the child's sixth birthday and lasted 8 years. In the absence of an upper primary school in his commune, the child spent this 8-year period at the primary school.

In addition to these fundamental types of schools there were secondary schools which admitted pupils chosen from among primary school pupils who had reached the age of 10. Thus, children admitted to a secondary school did not attend the upper primary school. The task of the secondary schools was to give pupils advanced general instruction and to prepare them for further studies at a school of higher education. For pupils who had completed their period of compulsory education, there were primary teacher training schools, vocational schools providing the necessary instruction for employment in industry, commerce or agriculture, and trade schools.

The fundamental characteristic of the educational system which has just been outlined was that schools could be either public schools administratively subordinate to the central authorities, provinces, districts or communes, or private schools dependent on associations, churches or religious bodies. If a private school satisfied the prescribed conditions, it enjoyed the same rights as the public schools.

During the period between the two world wars, the organization of public education in Czechoslovakia did not undergo any radical change; its characteristic feature was the differentiation introduced into the curricula as soon as pupils reached 11 years of age. Legally, all children had access to secondary education but, in fact, it was usually only children of well-to-do families who could attend a secondary school or an institution of higher education. On the other hand, children of the poorer families attended as a rule only the 8-year primary school during the period of compulsory education, or transferred to the upper primary school (grades 5 to 8) after reaching the age of 11. These studies gave pupils access only to what were regarded as the inferior occupations (e.g. the manual trades). As the State granted only a limited number of scholarships, very few children of needy parents were able to attend higher educational establishments.

On the liberation of the country after World War II, radical changes were made in the organization of public education by the Law of 21 April 1948 which introduced a uniform school in Bohemia, Moravia and Slovakia. This law extended the period of compulsory education from 8 to 9 years (i.e. until children reached the age of 15) and set forth the principles on which education in Czechoslovakia was thenceforth to be organized. It laid down that all children, without distinction as to their origin, social class or religious faith, should receive school education and instruction as follows: between the ages of 6 and 11, at the primary schools (national schools), and between the ages of 11 and 15, at the secondary schools. It was only for pupils over 15 years of age that instruction was differentiated, according as it was given at the compulsory vocational schools (usually providing a 3-year course) or at the selective schools, i.e. vocational schools (generally a 2- or 3-year course), higher vocational schools and 'gymnasiums' (upper secondary schools) (4-year course). Special schools were provided for children suffering from physical, moral or mental deficiency, difficulties of speech, or diseases requiring hospital treatment or special care.

In 1951, the education of adolescents was reorganized for vocational purposes. In the most important branches of the national economy, vocational centres for apprentices were established, their object being to train, within a 2- or 3-year period, a sufficient number of youths over 15 years of age. During their apprenticeship, the pupils of these vocational centres were maintained by the State and received their education and training free of charge.

Owing to the rapid development of the socialist form of society, it proved necessary, in 1953, to reorganize the school system once again, with a view to democratizing education still further, thus ensuring complete secondary instruction for all children. This reorganization was enacted by Law No. 31 of 1953 (School Law), which

GLOSSARY

* Entrants must have completed the 3-year general secondary course.

** Course for skilled workers who have had 3 years' practical experience; leads to qualification as supervisor or foreman, but does not prepare for secondary school leaving certificate.

*** Course for lower grades of employees.

hospodářské školy: vocational secondary and vocational training schools for careers in various branches of the administration of the national economic system.

hudební školy: vocational secondary schools of music.

lesnické školy: vocational secondary and vocational training schools of forestry.

mateřská škola (nursery school): pre-primary school.

mateřská škola pro M.V.Z.P.: pre-primary school for handicapped children.

odborné školy: specialized (i.e. technical and vocational) schools.

odborné učiliště učnovské školy: specialized (technical) schools for apprentices.

osvětové školy (cultural schools): vocational secondary schools training staff for libraries and other cultural institutions.

pedagogické školy: teacher training schools for teachers in nursery schools.

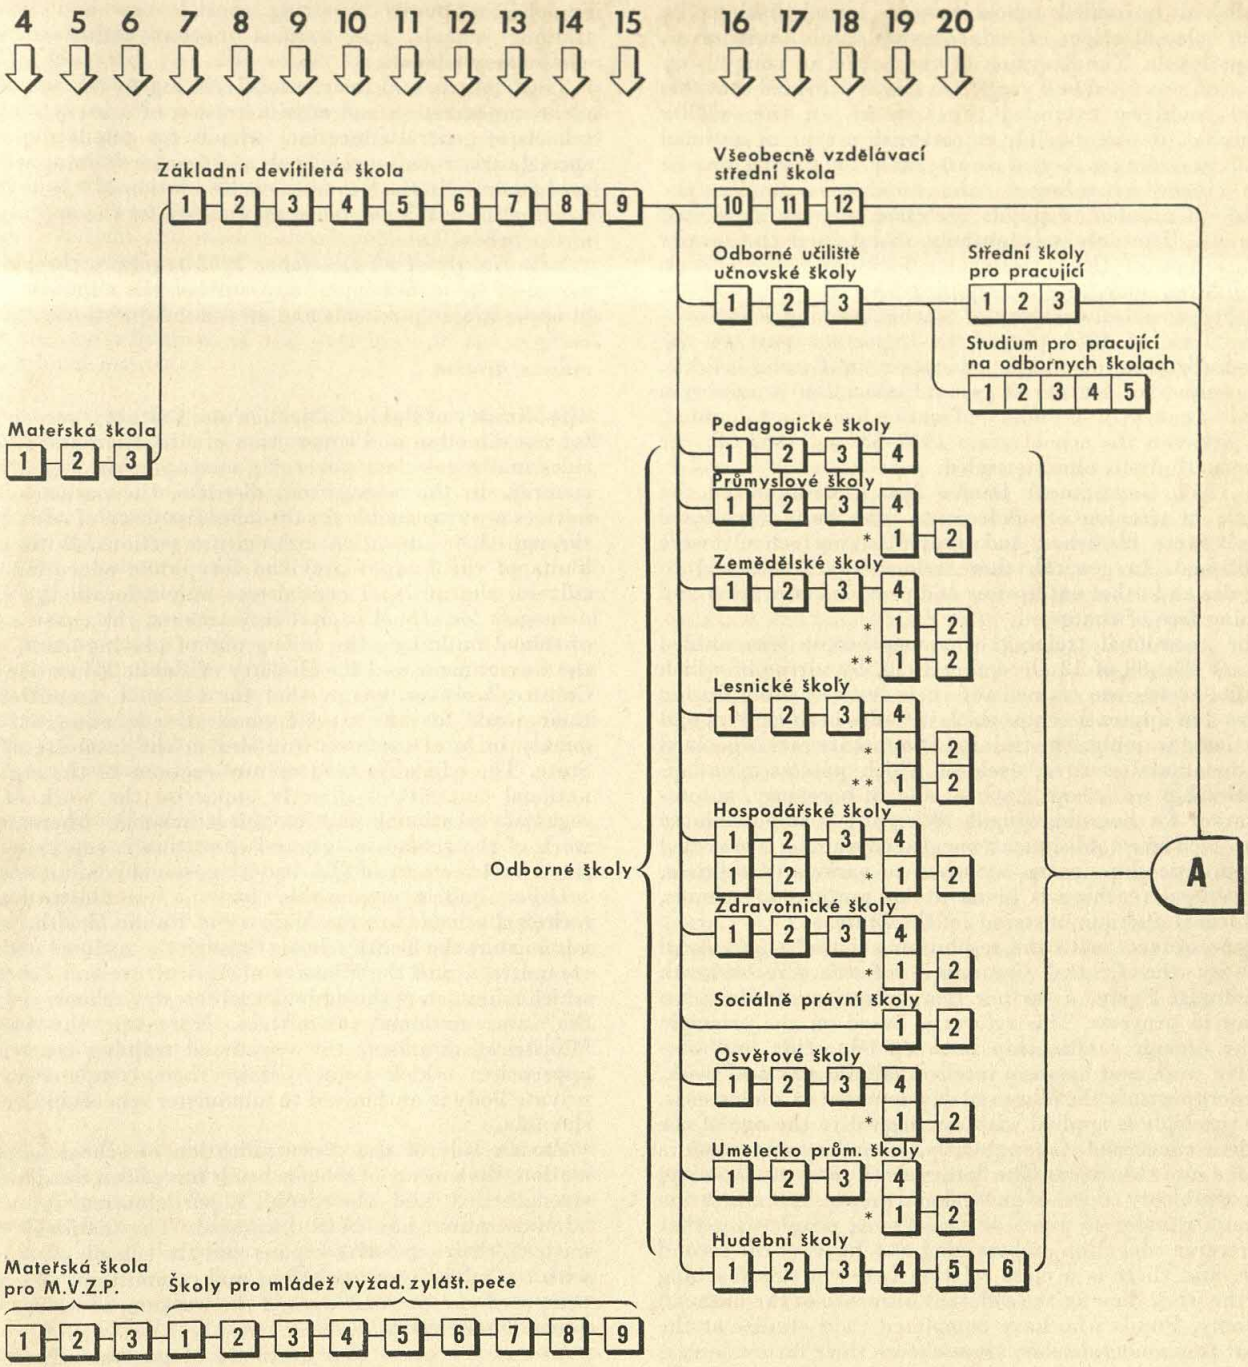
průmyslové školy: vocational secondary schools for industrial occupations.

školy pro mládez vyžad. zulášt. péče: special schools for handicapped children.

sociálně právní školy (social law schools): vocational secondary schools for social welfare workers.

střední školy pro procující: secondary schools for workers.

studium pro pracující na odborných školach: course of general studies for workers attending vocational and technical schools.



umělecko průmyslové školy: vocational secondary schools of applied art and crafts.

všeobecbě vzdelávací středni škola: general secondary school.

základní devitiletá škola: basic 9-year school, covering the period of compulsory education and organized in a first and second stage (*stupen*).

zdravotnické školy: vocational secondary schools for health workers.

A. Institutions of higher education (day and evening courses).

established a unified school system by abolishing the former classification of educational establishments at various levels. The duration of the period of compulsory education was fixed at 8 years, but it was provided that this period could be extended to 11 years. In the smaller communes, it was possible to establish a type of national school providing a 5-year course and comprising one or more classes according to the number of pupils; the maximum number of pupils per class was not to exceed 30 or 40. This law substantially maintained the former organization of the vocational schools and the schools for children and youths requiring special care, and established a special category of teacher training schools.

The Law of 1953 played an important part in the democratization of public education in Czechoslovakia. The number of schools of general education providing a complete course of secondary education has almost doubled, and, between the school years 1952–53 and 1957–58, the number of pupils almost tripled.

In 1954, Government Decree No. 19 reorganized the vocational training of adolescents. The basic vocational schools were abolished and apprenticeship schools were established. In general, these schools were attached to factories and other enterprises and provided education and training free of charge.

The vocational training of young people was unified by Law No. 89 of 12 December 1958, by virtue of which all adolescents are trained for their future calling during a period of apprenticeship which includes both general and vocational training. The training of apprentices is organized at educational centres, each of which possesses an apprenticeship workshop, a school and, if necessary, accommodation for boarding pupils. Where it is impossible to set up such an establishment, vocational training is provided at apprenticeship centres attached to various enterprises, and general teaching is given at apprenticeship schools, established and administered by the State.

In accordance with the resolution adopted on 23 April 1959 by the Central Committee of the Czechoslovak Communist Party, a further reorganization of education is now in progress. This reform is based on the principle of the organic relationship between education and productive work and between intellectual and physical work, in order to ensure the all-round development of adolescents. This principle is applied with due regard to the age of the children concerned. Consequently, secondary education is divided into two cycles. The first cycle (9 years of schooling) is a compulsory course of general and polytechnic education for pupils under 15 years of age. Young people over that age receive education and training at schools of the second cycle, and there is a close relation between this teaching and the work done in the different branches of the national economy. Pupils who have completed their studies at the 9-year fundamental schools can choose their future careers according to their individual tastes and aptitudes and with due regard to the needs of economic development.

Legal basis

Law No. 31 of 24 April 1953 (School Law), relating to the school system and teacher training, regulates the organization of schools of general education, vocational schools, schools for pupils requiring special care and teacher training schools, and various matters connected with compulsory education.

The fundamental instructions relating to the establishment, organization and administration of nursery schools, schools of general education, schools for pupils requiring special care, vocational schools and teacher training schools are laid down in the Government Resolution of 9 June 1953, which also contains detailed regulations for the application of the School Law.

Law No. 89 of 12 December 1958 regulates the organization of the education of apprentices, the administration of apprenticeship schools and all related questions.

Administration

The Ministry of Public Education and Culture is responsible for the direction and supervision of education and for the rules and regulations governing education throughout the country. In the regions and districts, the national committees are responsible for the administration of education, through their education and culture sections. Within the limits of the budget provided for public education and culture, the national committees may allocate the sums necessary for school capital investments, the construction of school buildings, the laying out of playing-fields, etc.; the Government and the Ministry of Public Education and Culture, however, ensure that the national committees in their work for the development of education act not merely in local interests but also in the interests of the State. The education and culture sections of the regional national committees directly supervise the work of the regional vocational and technical schools, whereas the work of the schools of general education is supervised by the school sections of the district national committees.

Other bodies responsible for the administration of technical schools are the Ministry of Public Health, which administers the health schools through the regional national committees, and the Ministry of Agriculture and Forestry, which administers the agricultural forestry schools through the same national committees. Moreover, the various Ministries administer the vocational training centres for apprentices which come within their competence. No private body is authorized to administer schools in Czechoslovakia.

As a result of the decentralization of school administration, the powers of schools heads have been considerably strengthened and the people's participation in school administration has been increased. The national committees, their executive organs and the schools co-operate with the advisory commissions and committees, which are composed of representatives of the workers, as well as with educational experts.

The study plans and curricula of general schools are drawn up by the National Institute for Educational Research, which depends on the Ministry of Public Education and Culture. The study plans and curricula of vocational and technical schools are prepared by the Institute of Research and Information for Vocational Schools. Highly qualified educational experts and experienced teachers co-operate in this work. After the study plans and curricula have been approved by the Ministry

of Public Education and Culture, they are binding upon the schools concerned.

The following also fall within the competence of the National Institute for Educational Research: the promulgation of educational directives for schools and for institutions for out-of-school education; the preparation and appraisal of school textbooks and teaching aids, including educational films, to be submitted for approval to the Ministry of Public Education and Culture; the study of the physical and mental development of children and youths; the preparation of articles and technical handbooks for teachers and educators; the organization of in-service training courses for teachers, educators and school workers; and the co-ordination of the activities of the regional educational institutes.

Supervision and inspection. Central, regional and district inspectors are responsible for supervising school work and equipment and for attending to the needs of the schools. The competence of the central inspectors of the Ministry of Public Education and Culture extends over the whole territory and covers, in particular, technical inspection. Regional inspectors, attached to the executive organs of the regional national committees are responsible for supervising the vocational schools and schools of general education of their region. The education and culture sections of the councils of the district national committees have district inspectors, who are responsible for superintending all the schools in their districts. The medical officers of the Public Health Department are responsible for the supervision of school health and hygiene.

Finance. All educational expenditure is borne by the State. Appropriations are made each year in the budget of the Ministry of Public Education and Culture, as well as in the budgets of the local, district and regional national committees. Teachers are state civil servants, the rate of their salaries varying according to the type of school in which they teach, their qualifications and their length of service.

Education is free, and some scholarships are available for secondary school pupils. During the school year 1957/58, 18 per cent of general secondary school pupils and 32.3 per cent of technical school pupils received government scholarships.

Buildings and equipment. The reorganization of education in Czechoslovakia, which was decided by the Order of the Central Communist Party's Decree of 23 April 1959, has necessitated an increase in school building as a result of the extension of the period of compulsory education from 8 to 9 years and the closer relations established between education and productive work. The system of separate pavilions, specially designed according to the purpose for which they are required, has been adopted as best suited to the needs of the new education.

In general, school buildings are constructed in accordance with standard plans, drawn up in co-operation with architects, educators and medical advisors.

Each school is responsible for procuring the equipment it needs. The funds for that purpose are assigned by the local, district or regional national committees, according to the type of school.

School building plans make the following provision for each school: ordinary classrooms (approximately 29½ ft. by 19½ ft. or 19½ ft. by 11¼ ft.) special classrooms for physics, chemistry and biology (39 ft. by 19½ ft.), each provided with a laboratory (19½ ft. by 11¼ ft.); one or two workshops; administrative premises, including a teachers' library, a pupils' library, a meeting room and from four to eight small rooms for various purposes (including a room for medical examinations); a gymnasium and its accessories; premises for out-of-class activities and recreation; a dining-hall and kitchens; cloak-rooms; caretaker's and driver's lodgings. In certain schools lodgings are provided for the head teacher and, in the new boarding-schools, for the teachers.

School building sites are usually large enough to include a garden, a playground and a playing-field with a running-track.

School welfare services. Nursery schools, national and secondary schools, and schools for children and youths requiring special care are provided with a health service, which is under the direction of a medical officer of the Public Health Department, assisted by a nurse specialized in child medical care. The school doctor carries out his duties at the school itself or in the consulting room of the administrative division under his control. All medical care for pupils is provided free and comprises regular medical inspections, prophylactic measures, treatment of chronic diseases, supervision of treatment given outside the school, anti-epidemic measures, hygienic supervision of the school buildings and the premises devoted to out-of-class activities, medical supervision of the staff, etc. The prophylactic measures include, in particular, dental care.

Schools are provided with canteens, where children may have lunch and, in some cases a morning or afternoon snack. Parents pay only part of the costs, the rest being borne by the State. The parents' contribution varies according to their income, and the number and age of their children. Teachers, also, may have their meals in the school dining-room, part of the costs being borne by the State.

School clubs, which are organically attached to the schools, enable children whose parents go out to work to spend their leisure hours to prepare their homework under the direction of a teacher, etc.

Pupils who do not live at the place where the school is situated are offered boarding accommodation paid for by the State; the parents make only a slight contribution to these costs and, in certain cases, are completely exempt.

TYPES OF SECONDARY EDUCATION

The basis of the Czechoslovak educational system is the compulsory 9-year school. The purpose of this system is to provide all children between 6 and 15 years of age with a complete general and polytechnical training, to prepare them to participate in productive work or to undertake higher studies, to assist them in the choice of a suitable profession and to give them a moral, aesthetic and physical training corresponding to the aims and needs of a communist society.

Young people over 15 years of age receive education and training in schools of the second cycle, which offer various courses combining teaching and productive work.

Complete secondary education is given at secondary schools for workers open to pupils who have completed their studies at a vocational school or an apprenticeship centre, at general secondary schools and at technical schools.

The democratic principle of orienting the young over 15 years of age towards certain specialized branches of education or certain studies guarantees the right of all sections of the population to acquire training of a high educational and social value in the appropriate educational establishments.

In all schools, the school year begins on 1 September and ends on 30 June, except for the terminal classes, in which the courses do not go beyond the end of the first fortnight of June. The first term of the school year, which comprises four terms, ends on 15 November, the second on the last Saturday in January, the third on 15 April and the fourth on 30 June. The holidays are as follows: winter holidays (from 23 December to 2 January), spring holidays (the dates of which are fixed by the Ministry of Public Education and Culture), and summer holidays (from the end of June to 1 September).

There are 6 school days per week and each lesson lasts 45 minutes.

Secondary schools for workers

These schools are designed essentially for young persons who, after completing their 9 years' compulsory schooling, have attended for 2 or 3 years an apprenticeship centre or a vocational school, where they have received specialized training for workers and extended their general and polytechnic knowledge. The degree of importance attached to practical training, on the one hand, and to technical, theoretical, general and polytechnical instruction, on the other, varies at the apprenticeship centres and vocational schools according to the trade taught.

The secondary schools for workers provide their pupils with complete secondary education and develop the vocational instruction they have already acquired; they also enable the pupils to acquire new qualifications and offer them the possibility of acceding to higher education. The courses which are provided by these schools and which usually last 3 years, are in the nature of evening courses, small group courses or correspondence courses. The organization and duration of the studies depend on the students' working conditions and on the general and technical training they have already received.

These secondary schools for workers are intended mainly to teach subjects that are related to a general and polytechnical education. They are organized at large enterprises or by national committees, and in all matters connected with teaching they are subject to the control of the Ministry of Public Education and Culture.

Courses for workers, particularly evening classes, are also being considerably extended in the technical schools. These courses, amounting to 15 hours a week, are given after working hours. The correspondence courses have not progressed to the same extent, the pupils following them study by themselves and have only to consult teachers every second week, each fortnightly consultation totalling 8 hours. The evening and correspondence courses last 5 years and are divided into two cycles. Pupils who successfully complete the first cycle are qualified to occupy technical and economic posts or, perhaps, some other specialized and subordinate position, while those who complete the 5-year course can present themselves for the school leaving examination. Employers are bound to grant facilities to all pupils who attend technical schools and schools of general education while in employment. One of the advantages most appreciated by these pupils is 4 hours' leave with pay every week until the conclusion of their studies.

General secondary schools

These schools, in which the duration of the attendance is 3 years (tenth to the twelfth years of schooling), also provide a complete secondary education; usually, each of these schools is organized as part of a 12-year school. In addition to complete secondary education (general and polytechnical), the pupils receive the elementary special training necessary for work in a particular branch of the national economy or a cultural occupation.

One of the main tasks of the 12-year schools is to prepare pupils for studies at an institution of higher education. Further, on leaving a 12-year school pupils can rapidly acquire the training required for the average technical post by following special technical courses; they can also be admitted to special technical courses organized at various enterprises or begin work immediately in certain branches of the national economy or cultural occupations.

The teaching at the 12-year schools is organically related to the pupils' productive work at industrial enterprises or on farms. For that purpose, a new subject has been included in the curricula, namely the 'bases of productive work'. In the teaching of this subject, the relation between theoretical and practical work and the alternation of the theoretical with the practical exercises, adapted to suit local conditions, are designed to promote the harmonious all-round development of the pupils.

The 10th class of the 12-year secondary schools is open to pupils who have successfully concluded their 9th year of compulsory schooling and who have been recommended by the school which they are attending or by the enterprise where they are working. A commission, presided over by the school head and consisting of representatives of the district national committee and of two of the school's teachers, decides whether candidates are to be admitted to the 'selective classes'. In doing so, the commission makes sure that the social composition of the group of young people thus admitted corresponds to the social composition of the Czechoslovak community and that due regard is paid to the importance of the working classes and their role in the State.

The following table shows the distribution of the weekly teaching hours among the various subjects included in the curriculum of the 10th-, 11th- and 12th-year classes of the 12-year secondary schools.

The practical work is done at the productive enterprises during the holidays, in accordance with the directives of the Ministry of Public Education and Culture.

TIME-TABLE FOR GENERAL SECONDARY SCHOOLS
(in periods per week)

Subject	Year		
	10	11	12
Compulsory subjects			
Mother tongue and literature	3	3	3
Russian language and literature	2	2	2

Modern language (conversation)	2	2	2
Optional subjects			
Latin	2	2	2
Music	2	2	2
Art	2	2	2
Sport	2	2	2
Practical courses and activities	2	2	2

1. The pupil must choose one of these subjects.

The marks which are assigned to the pupil for the various subjects at the end of the school year are not an arithmetical mean, but indicate his level of learning, the skill he has shown and the aptitudes he has acquired during the year. These marks are based chiefly on the results of the pupil's last written work, but also take account of the quality of his work throughout the year.

Promotion of a pupil from one class to the next depends on the whole of his work during the year; he can be promoted only if he has not been marked 'poor' in any of the compulsory subjects. If marked 'poor' in any of these subjects, he must sit for an examination in that subject at the beginning of the new school year.

At the end of their 12th year's studies at a general secondary school (or at a technical school), pupils sit for the school written and oral leaving examination. The written examination is on the Czech and Russian languages and the oral examination on four subjects, three of which (Czech, Russian and mathematics), are compulsory. Each candidate chooses the fourth subject from among the following: biology, chemistry, geography, history, and physics. The board of examiners is presided over by a member of the school administration or by the head of another 12-year secondary school.

The 10th-, 11th- and 12th-year courses can also take the form of evening or correspondence courses for workers and there are also out-of-school courses, lasting a year, for those studying for the school leaving examination.

The 10th-, 11th- and 12th-year classes are entrusted to teachers who have been trained at the universities; these teachers complete their training by attending special courses and seminars.

Technical schools

The main purpose of these schools is to train technical workers for service in the national economy, public health, etc., and at the same time provide pupils with the general and polytechnical education they need. The principle of the connexion between education and productive work is also maintained at these schools even if their work is not directed to production.

The duration of the technical school course varies from 2 to 4 years, except at the schools of music, where the course lasts 6 years. Usually, technical schools provide a 4-year course for pupils who have completed their compulsory education. At present, only a small proportion of technical school pupils have already been engaged in productive work, but in about 3 years' time these schools will be open only to pupils who have been employed for at least a year on productive work. On completion of their studies at a technical school pupils sit for the school leaving examination. In the case of pupils who have completed their studies at a 12-year general secondary school, the duration of the technical school course is reduced by 2 years and the work is restricted almost entirely to technical subjects. In that case, the school leaving examination is only in these subjects, since the pupils will have already passed the general secondary school leaving examination.

There are also, at a lower level, schools for supervisors, which provide a 1- or 2-year course for skilled workers who have been employed for several years in agriculture, forestry and the consumer goods industry. In the mechanical construction industry, such training is usually given at the enterprises themselves, as part of the workers' education. Workers who successfully complete their studies at these schools become foremen or obtain subordinate technical posts. The course provided at the schools for supervisors does not qualify pupils for the school leaving certificate nor give them access to higher educational establishments.

The vocational training schools of economic administration, which provide a 2-year course and train their pupils for subordinate posts, are open to pupils who have completed their compulsory education and who have not yet been engaged in productive work. The course provided by these schools does not qualify pupils for the school leaving certificate nor give them access to higher educational establishments.

Young persons who have completed their studies at a technical school usually begin work immediately at an undertaking corresponding to their qualifications. Those who hold the school leaving certificate may continue their studies at a higher educational establishment. The proportion of those who do so is fixed in accordance with national economic needs. Particularly gifted pupils of schools of music are trained so as to enable them to study music at higher educational establishments. According to present plans this system of schools is to be extended considerably.

At the technical schools, of which there are several kinds, theoretical technology and general education are taught by teachers who have studied at the universities, hold a university diploma corresponding to the subjects they teach (technical subjects, economics, medicine, etc.) and

have received special training in teaching. They must have undergone a trial period in the practice of the discipline they are required to teach. Teachers employed in the practical training of the pupils must hold the school leaving certificate as well as a diploma of the technical school corresponding to their branch of teaching and in addition they must have received special training in teaching.

Industrial schools. These schools comprise 101 sections grouped in 16 main categories: nuclear technology, geology and geological prospecting, mining, energy, metallurgy, mechanics, electro-mechanics, chemical technology, technology of the food industry, wood and pulp industry, light industries, graphic industries, geodesy, building, transport, communications.

The following table shows the teaching plan of a school training for industrial occupations.

TEACHING PLAN OF A SCHOOL FOR INDUSTRIAL MECHANICS

1. Special technology: chemical technology, technology of glassmaking, technology of ceramics, agricultural technology, technology of architecture, mechanization of construction.
2. Including the courses common to the various sections.

Agricultural schools. They comprise technical schools (4-year course) and schools for agricultural overseers (1- or 2-year course).

Forestry schools. They comprise technical schools (4-year course) and schools for forest supervisors (1-year course).

Economic administration schools. The task of these schools is to train skilled workers for posts in the fields of transport, communications, commerce, international economic relations and food, as well as directors for selected restaurants and hotels, and employees for the economic administration services.

Social law schools. Since the school year 1959/60, these schools have been replaced by 2-year courses open to holders of the 12-year school leaving certificate. They train social workers for all activities relating to public education and culture within the competence of the councils of the national committees, for social insurance, etc.

Schools for assistant medical workers (4-year course). They train nurses, staff for the laboratories of the health services and for dental, pharmaceutical and optical laboratories.

Cultural schools (4-year course). They train employees for libraries and cultural organizations (houses of culture, cultural circles, cultural parks, etc.).

Schools of music (6-year course). The music teacher training schools train directors of popular group performances as well as teachers for the elementary schools of music; the dancing sections train men and women dancers for theatrical and other groups.

Arts and crafts schools (4-year course). These schools train various categories of skilled workers (plastic and decorative arts, artistic finishing of industrial products, graphic arts, etc.).

Teacher training schools

Under the present system of teacher training in Czechoslovakia, only schools which train nursery school teachers are classed as technical secondary schools. The course lasts 4 years and at the end of it students sit for the school leaving examination. These schools are open to students who have completed their compulsory education at the 9-year schools; the teachers employed in these training schools must have obtained a university diploma for teachers of the last three classes of general secondary schools.

The teacher training schools provide future nursery school teachers with a general training as well as with specialized training in the following subjects: mother tongue and literature, Russian language and literature, mathematics, physics, chemistry and mineralogy, biology, geography, history, psychology and logic, pedagogy and the history of pedagogy, hygiene of infants of pre-primary school age, art training (theory and practice), musical training (theory and practice), study of a musical instrument, physical culture (theory and practice), manual work and gardening, methods of teaching the mother tongue, methods of developing teaching knowledge and practice.

Out-of-class activities

The State and the entire community ensure the child's education not only during, but also outside, class hours.

Besides the participation of the schools in the out-of-school education of children and youths, this task is also incumbent on the clubs which have been created at schools of general education and at schools for children requiring special care, on associations of parents and friends of the school, on the Czechoslovak Youth Union and its Organization of Pioneers, as well as on institutions concerned with out-of-school education proper, e.g. the Pioneer and Youth Centres. Further, the Committees of the Revolutionary Trade Union Movement (attached to the various enterprises) concern themselves with youth through their commissions; mention must also be made of the clubs attached to the various enterprises, the state bodies responsible for cultural education and the social organizations such as the Czechoslovak Physical Culture Association, the Czechoslovak Red Cross, the Women's Committees, etc.

It is the Czechoslovak Youth Union and its Organization of Pioneers which do the most for the more informal education of children and young people. In the schools and at the various enterprises the union applies itself to encouraging the young to study assiduously and conscientiously, to employ efficient working methods, to make themselves familiar with the most valuable aspects of the national culture and world culture and to keep themselves in good physical condition by taking an active part in physical culture and sport. At the same time, the union gives its members and young people in general a systematic political training.

The Organization of Pioneers which was founded in 1949, follows the traditions of the proletarian children's organizations which existed before the second world war; at present, its members total almost a million volunteers between 9 and 15 years of age, in addition to children between 6 and 9, known as 'sparks'. The basis of this organization is constituted by groups of pioneers formed at the schools and by sections of pioneers in each class. Within these sections, the children constitute small teams which devote themselves to various activities. Teachers, parents and other experienced workers assist the heads of sections, who are usually members of the Czechoslovak Youth Union.

The Organization of Pioneers encourages the children to devote some of their spare time regularly to work which is of use to the community in general; thus, for instance, they assist in the laying out of the school, town and communal surroundings and of parks and gardens, take part in the harvesting and autumn farm work, etc. A large number of choirs, dance groups, theatrical troupes and marionette companies give performances for the members of the Organization of Pioneers and arouse the children's interest in music, singing, the theatre and the creative principles of popular art. The organization also arranges such cultural and sports activities as open-air holidays, games, excursions, walks, tours, camps, athletic competitions and festivals.

In collaboration with the organization and with the help of the pupils' parents and other workers, the schools offer children the possibility of seeing plays and films, attending concerts, visiting exhibitions, taking part in excursions, in youth gatherings on the occasion of festivals, etc.

Out-of-school institutions, such as the Pioneer and Youth Centres, the Young Naturalists' Centres, the Young Technicians' Centres and the Tourist Centres, give considerable support to the organization. The chief aim of these institutions is to give systematic assistance to the monitors of the pioneers, as well as to teachers, educators and all those concerned with youth, by developing the children's interest and cultivating their natural gifts and talents.

The Revolutionary Trade Union Movement plays an important part in the organization of the children's out-of-school activities. More than four thousand factories support the schools. Through their commissions on mass cultural work and their commissions for work with children, the Committees of the Revolutionary Trade Union Movement (attached to the various enterprises) organize, for the benefit of the children, evening entertainments, theatrical performances or film shows, visits to factories, summer holiday camps, etc.

The school youth clubs, directly attached to the schools of general education, are of special importance. Their activities are laid down by the head of each school, and their main task is to provide occupation and recreation, under the supervision of monitresses, for children who remain on the school premises after school hours while waiting for transport or because their parents are at work. Their educational activities are co-ordinated with those of the school and those of the Organization of Pioneers of the Czechoslovak Youth Union. They offer children opportunities for rest and recreation, help them to prepare their lessons and homework for the following day and enable them to interest themselves in the most varied subjects: natural sciences, technology, art, sports, games, reading, etc. The children are grouped in sections according to their age and work under the direction of a trained educator. In 1958, approximately 150,000 children attended the school clubs.

TRENDS AND PROBLEMS

The reorganization of the educational system in Czechoslovakia, inaugurated by the Order, dated 23 April 1959, of the Central Committee of the Communist Party, is designed to provide the overwhelming majority of the country's young people with complete secondary education from 1970 on.

In order to show that physical work is a means of education and inculcate in young people a proper respect for work, the principles and contents of modern education in Czechoslovakia are based on the organic relationship between education and participation in social life and productive work, according to the child's age and capacities.

The aim of this new system of education is to train young builders of socialism and communism, by giving them instruction not only in the fundamental sciences, but also in the scientific principles of production and its technology and organization, so that they will become quite familiar

with the main branches of production and acquire a certain degree of manual skill, while receiving both a complete general secondary education and polytechnical training. Adolescents will thus have access to higher education and will have the basic technical training necessary for the exercise of activities in various branches of the national economy or of culture.

Area: 49,366 square miles; 127,859 square kilometres.
Population density: 273 per square mile: 105 per square kilometre.

Summary of school statistics, 1953–57. In 1957/58, school enrolment (not including foreign students enrolled in institutions of higher education, all students enrolled in evening, extra-mural and correspondence courses, or adults receiving a general or vocational education in such courses) reached a total of 2.5 million pupils, being 19 per cent of the total population. Of these pupils, 10 per cent were enrolled in nursery schools, 77 per cent in primary schools (grades 1 to 8), 3.5 per cent in general secondary schools, 5 per cent in vocational schools, 1 per cent were in teacher training institutions, 2 per cent in institutions of higher education other than teacher training colleges, and 1.5 per cent in special schools for handicapped children. The proportion of girls was 49 per cent in primary education, 57 per cent in general secondary education, 43 per cent in vocational education, 89 per cent in secondary teacher training, and 31 per cent in higher education. The average number of pupils per teacher in primary education was 26. Between 1953 and 1957, enrolment in grades 1–8 increased by 7 per cent, while secondary education altogether increased by 36 per cent. (See Table 2.)

Enrolment trends in secondary education, 1930–57. Between 1930 and 1936 there was a steady increase in enrolment at the secondary level (including grades 5–8 in the general secondary schools). The average total enrolment for 1935–36 was 22 per cent higher than that for the period 1930–34. Between 1947 and 1957, counting only grades 9–11 in the general secondary schools, there was a rapid increase in enrolment under each category, and particularly in teacher training schools. The average total enrolment for the 1955–57 period was almost 50 per cent higher than for

1. From 1930 to 1936, grades 5-11; from 1947 to 1957, grades 9-11.

DENMARK

THE EDUCATIONAL SYSTEM

In Denmark 'secondary education', in the sense of education beyond primary schooling for young persons aged from 12 to 18 years, covers three types of education: secondary education proper, of a general nature; further education for youth; and vocational education.

There is no constitutional authority for the provision of such secondary education; the Danish Constitution merely stipulates that all children of compulsory school age, from 7 to 14 years, shall have the right to free education in the public primary schools. In fact, up to the beginning of the twentieth century only a small minority of children and young people received more than elementary schooling. Subsequent social developments, the progress of democracy, and increased specialization and mechanization, have however made life ever more complex—requiring ever higher educational attainments on the part of the young.

Secondary education proper, of a general nature. Schools providing this type of secondary education are at present undergoing reorganization. Two Acts of 7 June 1958, the first amending the Public Education Act of 18 May 1937 and the other on the secondary schools preparing for university entrance (*gymnasier*), have introduced a new educational structure which will gradually replace the one provided under the Secondary Education Act of 24 April 1903 and the Public Education Act of 1937. Hitherto education in urban areas has been based normally on a 4- or 5-year primary school (*grundskole*) (from the age of 7 to 11 or 12) followed by a 3- or 4-year non-examination middle school (*examensfri mellemskole*), or a parallel 4-year examination middle school (*examensmellemskole*) leading to the middle school examination. The latter course is followed by a 1-year *realklasse* concluding with the *realeksamen*; alternatively, after the middle school examination, the pupils can enter a 3-year *gymnasieafdeling* or upper secondary department leading to the *studentereksamen* (which qualifies for university entrance). Instead of middle school plus *realklasse*, the primary school can also be followed in the old system by a 4- or 5-year preliminary school (*praeliminaerskole*); this prepares pupils for the 'general preliminary' examination, which on the whole is equivalent to the *realeksamen*. In rural areas the school system has been as a rule an undivided 7-year school (*landsbyskole*). In such cases an examination school cannot be provided, but sometimes a 2- or 3-year course for the general preliminary examination is set up. According to the new scheme (see diagram on page 411), education both in urban and rural areas is to consist of a 7- or 8-year general school (*hovedskole*) which can have a ninth-year class. In continuation of the seventh-year class, a 3-year *realskole* can be set up, concluding with the *realeksamen*. After the second year of *realskole*, pupils can be admitted to a 3-year *gymnasie* department which concludes with the *studentereksamen* (university entrance).

During the school year 1958/59, first-year middle school classes and first-year preliminary classes were allowed to be formed for the last time according to the Acts hitherto in force. These classes will pass through the school system provided under the old laws. In the school year of 1959/60, sixth-year general school classes will be formed for the first time under the new Acts, seventh-year classes in 1960/61, and so on up the new school ladder until the changeover has been completed.

The 'examination schools' are organized either as (a) middle schools with a *realklasse* ('middle and *real* schools') or preliminary schools (with or without primary school)—*realskoler* according to the new Act, or (b) *gymnasier*, consisting of two sections, a middle school and *realklasse*—*real* section under the new Act—and the *gymnasie* section. They may be run by municipalities, private persons or by the Central Government (except that the latter may run *gymnasier* only).

All schools are under the supervision of the Ministry of Education. However, the local education authorities have considerable influence upon the operation of municipal schools, and principals of private schools are also free within wide limits. On account of the small extent of the country and the homogeneity of the population, a strongly centralized educational system has been practicable. Thus all schools in Denmark, whether state, municipal or private, must meet the same requirements as regards equipment, teaching and examinations.

There are no great problems of language, culture or religion affecting the teaching in schools. The German minority in the region bordering on Germany is allowed to establish German language private examination schools, preparing pupils for the middle school and *real* examinations, with the same rights as Danish schools. Foreign religious denominations are free to establish private examination schools if they comply with the ordinary rules governing the organization of education. However, if such schools enrol children who belong to the Established Church of Denmark, they are required to provide these pupils with religious instruction in conformity with their faith (Lutheran). Pupils in all schools may be excused from attending religious instruction if their parents so desire.

Further education for youth. Further education is a non-compulsory form of instruction under the Ministry of Education. It is open to children and young people who have left school at the termination of compulsory school age or later. Institutions coming under this head are youth schools, evening schools, junior folk high schools, agricultural courses, correspondence schools, certain leisure activities for young people, domestic science colleges, folk high schools and agricultural schools. As shown by their names, some of these schools border upon vocational

education, as the instruction emphasizes a speciality. Municipalities, associations and private organizations may arrange for further education.

Vocational education. Vocational education proper, for children and young people beyond the compulsory school age, comes mainly under the Ministry of Commerce. The two most important groups of vocational schools are the commercial and the technical schools; they are usually private institutions and are operated by trade organizations, civic associations and the like. According to the provisions of the Apprentice Act of 2 October 1956, attendance at the respective vocational schools is compulsory for shop and clerical trainees and for factory and workshop apprentices; apprenticeship contracts must be signed between employers and apprentices under the age of 18, and contain certain conditions prescribed by the Act. In the contract the employers must undertake to give their apprentices practical training and to pay for their tuition at a vocational school.

The diagram on p. 411 shows the Danish educational system as a whole.

THE DEVELOPMENT OF SECONDARY EDUCATION

Already in the Middle Ages there were in Denmark 'learned' schools which prepared pupils for subsequent university studies. Up to the beginning of the nineteenth century they had the character of church schools. The rising forces of democracy looked with distrust upon the learned school, its social background and the way it was run.

The first preliminary school or *realskole* in Denmark was founded in 1787 after a German model, but it was not until the Ordinance of 29 July 1814 on board schools in urban areas that an effective foundation was laid for schools of this type. *Realskoler* were intended for children who, while not needing a particularly academic course, were however destined for work demanding certain educational attainments. In 1881 a final examination was introduced, the General Preliminary examination, which was given definite form through a Royal Ordinance of 1 March 1895.

In April 1903 a Secondary Education Act was promulgated, reforming both the old *realskole* and the learned school. The social significance of the Act was that it linked up secondary education with the elementary education in the public primary school, thus making it possible for a child to climb directly from the first-year primary class to the highest rung of the educational ladder.

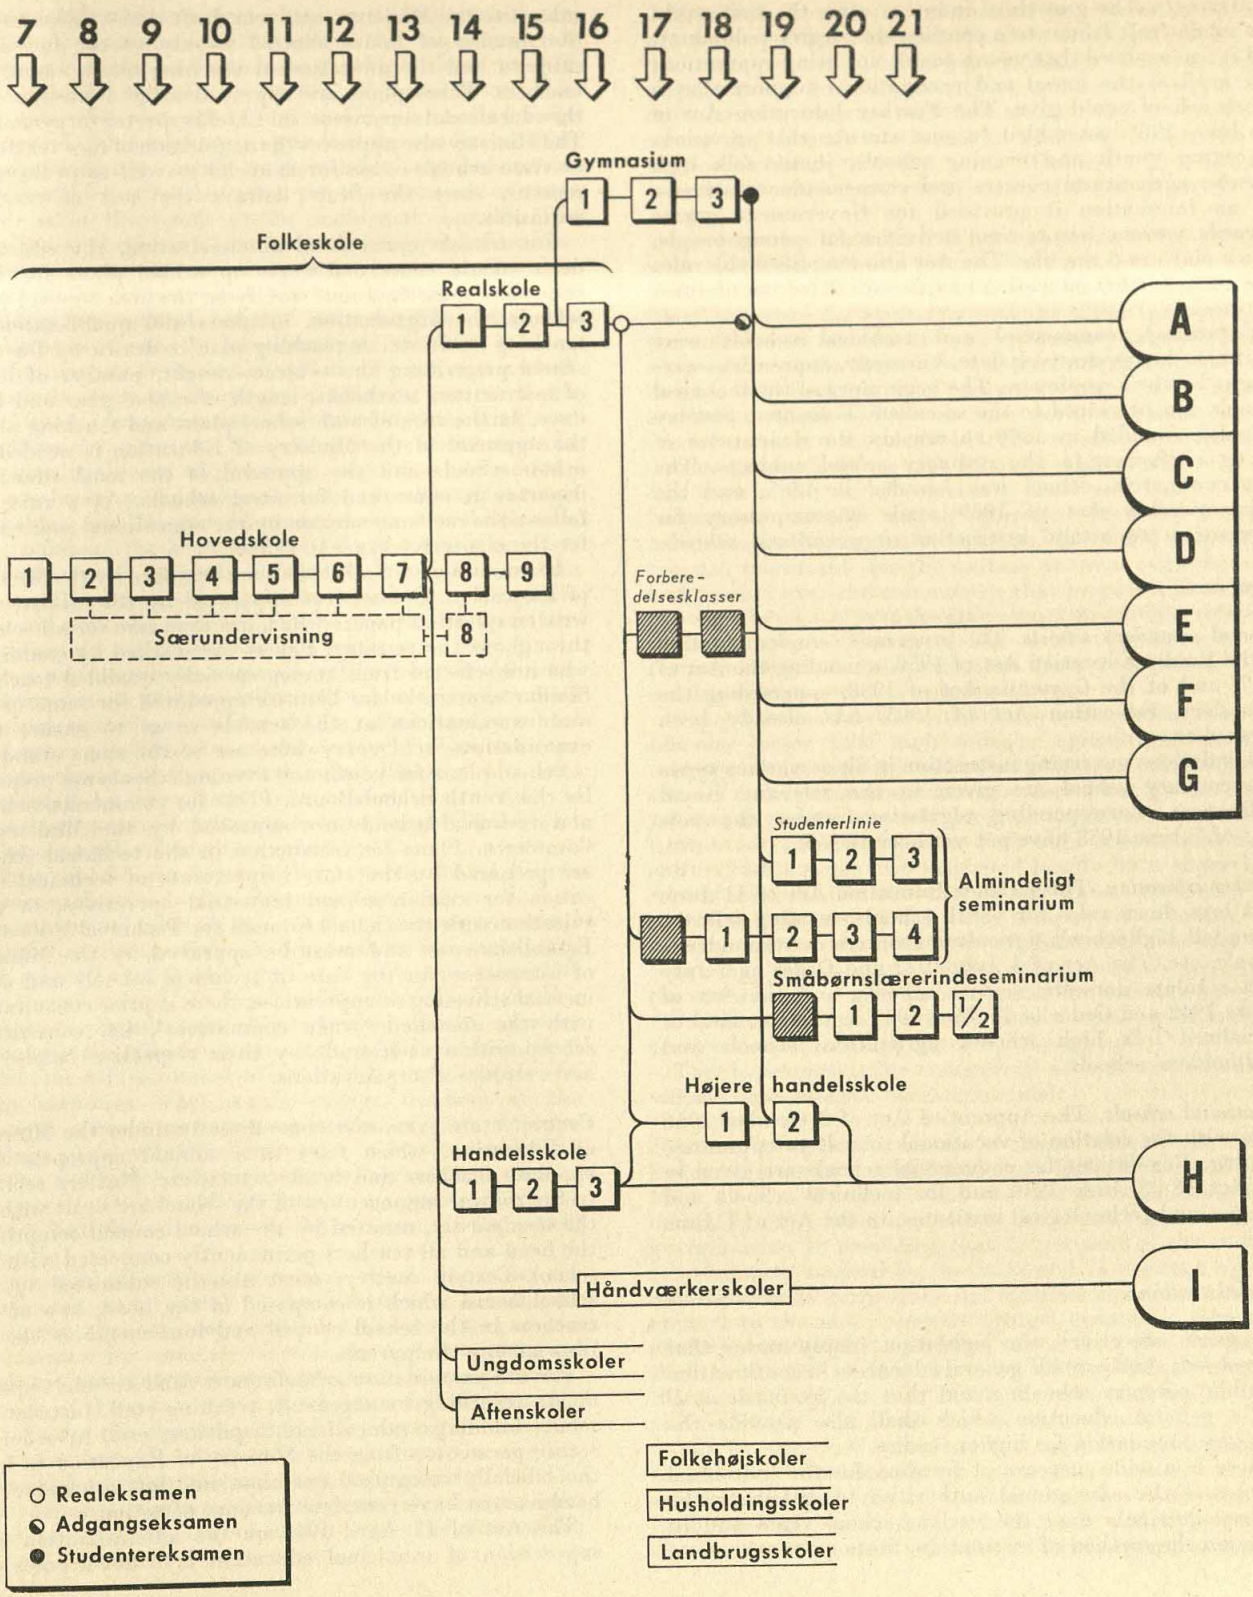
The curriculum in the middle school was also brought more into line with that of the public primary school. The middle school supplemented by the *realklasse* was intended from now on to take the place of the preliminary school. However, things did not go quite that way and there are still a few preliminary schools in existence (about fifty).

The Public Education Act of 1937 made the 4-year middle school stage at the municipal middle school plus *realklasse* an integral part of the public primary school, and established the non-examination middle school to run parallel with it. The *gymnasier* which replaced the 'learned' schools were to consist of four middle school classes followed by three *gymnasie* classes, so that education throughout the course of the school should form an integrated whole. As a rule, the *gymnasier* also have a *realklasse*.

The two Acts of 7 June 1958, i.e. the Public Education Act and the *Gymnasie* Act respectively are now reforming the school structure. The background to this reform and the consequences for the organization of secondary education will be discussed in some detail in a later section.

As regards further education, the Public Education Act of 1814 had already provided that young people after confirmation age should be given facilities for keeping up their school attainments; in 1844 was established the first folk high school, a characteristic feature of Danish further education which has meant a great deal in popular enlightenment and character development, particularly for

GLOSSARY



aftenskoler: evening schools for young people providing non-vocational education beyond compulsory school years.
folkeskole: complete course of elementary education covering primary school and lower secondary school.
folkehøjskoler: residential colleges providing courses of general education (folk high schools).
forberedelsesklasse(r): preparatory class(es) for entrance into certain institutions.
gymnasium: upper general secondary school.
handelsskole: lower vocational secondary school of commerce.
håndværkerskoler: part-time vocational training schools for apprentices.
højere handelsskole: upper vocational secondary school of commerce.
hovedskole: primary school.
husholdningsskoler: schools of domestic science for adults.
landbrugsskoler: agricultural schools of further education.
realskole: lower general secondary school.
småbørnslærerindeseminarium: teacher training college for teachers in pre-primary and infant classes.
særundervisning: special schools for physically and mentally handicapped children.
seminarium: teacher training college.
studenterlinie (på seminarium): accelerated course at teacher training college.
ungdomsskoler: schools for young unskilled workers.

POST-SECONDARY EDUCATION

A. *Universitetet:* university.
B. *Polyteknisk-læreanstalt:* technical university.
C. *Tandlægehøjskolen:* college of dentistry.
D. *Farmaceutisk læreanstalt:* college of pharmacy.
E. *Det kgl. akademi for de skønne kunster:* Royal Academy of Fine Arts.
F. *Musikkonservatoriet:* conservatory of music.
G. *Den kgl. veterinær- og landbohøjskole:* Royal Veterinary and Agricultural College.
H. *Handelshøjskolen:* business college.
I. *Teknikum og supplerende teoretisk og praktisk uddannelse:* technical college.

EXAMINATIONS

adgangseksamen: entrance examination.
realeksamen: lower secondary leaving examination.
studentereksamen: matriculation.

● Studentereksamen

rural youth. The growth of industry after the first world war made craft labour to a considerable degree redundant, and it was realized that young people not being apprenticed had need of the moral and occupational support that a youth school could give. The Further Education Act of 11 June 1954 assembled in one statute the provisions governing youth and evening schools, junior folk high schools, agricultural courses and correspondence schools. As an innovation it provided for Government grants towards various leisure-time activities for young people, youth clubs and the like. The Act also simplified the rules governing further education and decentralized its administration.

Vocational, commercial and technical schools were established comparatively late. Formerly, apprentices were taught by their employers. The beginnings of the technical schools can be traced to the so-called 'Massmann Sunday schools', founded in 1800 to remedy the deficiencies of young craftsmen in the ordinary school subjects. The first commercial school was founded in 1865, and the Apprenticeship Act of 1889 made it compulsory for apprentices to attend instruction at vocational schools.

Legal basis

General secondary schools. The progressive implementation of the Public Education Act of 1958, amending the Act of 1937, and of the *Gymnasie* Act of 1958, superseding the Secondary Education Act of 1903, has already been referred to.

Regulations governing instruction in these various types of secondary school are given in the relevant Royal Ordinances. Corresponding regulations under the new Acts of 7 June 1958 have not yet been issued.

Further education. The Further Education Act of 11 June 1954 lays down rules for youth schools, evening schools, junior folk high schools, agricultural courses, correspondence schools, etc. The Act of 4 July 1942 and Order of 6 July 1956 regulate domestic science schools, and the Act of 4 July 1942 and Order of 15 June 1955 regulate general or specialized folk high schools, agricultural schools and smallholders' schools.

Vocational schools. The Apprentice Act of 2 October 1956 deals with the relation of vocational schools to apprentice training. Regulations for commercial schools are given in the Act of 23 June 1920 and for technical schools and colleges, and technological institutes, in the Act of 7 June 1958.

Administration

As regards objectives, the legislation simply states that the *realskole* shall provide general education in continuation of public primary schooling and that the *gymnasie* shall give a general education which shall also provide the necessary foundation for higher studies.

There is a wide measure of freedom for the individual school and the educational authorities to distribute the required curricula over the various school years and to decide on the method of instruction. State *gymnasier* must submit to the Ministry each year draft time-tables showing the number of hours allotted weekly to the individual subjects and the allocation of teaching hours among the teachers. These plans are approved after discussion with the educational supervisor, the Chief Inspector for *gymnasier*. The Ministry also approves the acquisition of new textbooks at state schools—this for financial as well as pedagogical reasons, since the State defrays the cost of teaching requisites.

For schools under local administration, the education departments concerned draw up school plans for their respective municipalities, specifying the area served by the schools, the organization, numbers and qualifications of teaching staff, etc. A teaching plan is drawn up for each school prescribing the subjects taught, number of hours of instruction, textbooks, length of school year and holidays. In the case of both school plans and teaching plans, the approval of the Ministry of Education is needed for urban schools and the approval of the local education department concerned for rural schools. As a rule this follows the recommendation by the educational supervisors for the respective types of school.

Examinations for all schools are arranged by the Ministry of Education. Committees appointed by the Ministry set written question papers which are the same for all schools throughout the country. Papers are marked by examiners who are selected from among specially qualified teachers. Similar examiners are likewise appointed for some of the oral examinations at the schools so as to ensure that examinations held everywhere are of the same standard.

School plans for youth and evening schools are prepared by the Youth School Board. Plans for commercial schools and technical schools are approved by the Ministry of Commerce. Plans for instruction in the technical schools are prepared by the state inspectorate of technical education for craftsmen and industrial operatives, in consultation with the School Council for Technical Education Establishments, and must be approved by the Ministry of Commerce. In the case of technical schools and commercial schooling of apprentices, there is prior consultation with the so-called 'trade committees', i.e. committees set up within each trade by their respective employers' and employees' organizations.

Control. State *gymnasier* come directly under the Ministry of Education, which fixes their annual appropriations, appoints teachers and headmasters, etc. Matters relating to the routine management of the school are dealt with by the headmaster, assisted by the school council comprising the head and all teachers permanently connected with the school. Certain matters must also be submitted to the school board which is composed of the head, two of the teachers in the school council and four members elected from among the parents.

Private examination schools must fulfil certain requirements regarding management, teaching staff, instruction, school buildings, educational requisites, etc., in order to secure permission from the Ministry of Education to hold the officially recognized examinations, but otherwise the headmasters have complete freedom of action.

The Act of 12 April 1949 on the administration and supervision of municipal education lays down rules for

the management of municipal schools, including examination schools. A characteristic feature is the important role played by parents and the influence they exert through the municipal agencies concerned. Permission to hold examinations is also granted to municipal schools by the Ministry of Education subject to certain conditions. The Act provides that certain matters are to be decided by the Ministry, but in the main the management of these schools is in the hands of the municipal councils. The immediate supervision is carried out either by the education committee alone for the whole municipality, or by that committee in conjunction with boards of governors for individual or several council schools. The education committee is chosen by the municipal councils, making sure that parents from each school district are represented. The boards of governors consist of three or five members, one of whom is appointed by the education committee and the others by parents. The education committee, and sometimes the board of governors, supervise the teaching in the schools, make suggestions as to school plans and time-tables, etc. The general management of each school is in the hands of the headmasters. To assist him, there is a teachers' council which is entitled to a voice in certain matters. The teachers from all the schools in a town form the joint council, which must be heard on questions concerning the school system as a whole.

Urban municipalities come directly under the Ministry of Education in matters affecting schools, whilst rural municipal councils are under the so-called county school directorates which consist of the County Prefect and four members chosen by the county council. These directorates are assisted by the county educational adviser who is chosen from among teachers who have taught for at least 10 years in public elementary schools.

Youth schools are supervised by youth school boards set up for each municipality and consisting of representatives of the municipal council, the teachers, and organizations interested in youth work. Within each county, a county youth school board is also appointed with representatives of the county council, the Teachers' Association of Denmark and various organizations. These boards have to approve private youth schools or to recommend to municipal councils the establishment of municipal youth schools and leisure activities. The boards engage teachers at the municipal schools and suggest scales of pay, approve buildings, plans of instruction, etc.

Junior and senior folk high schools, agricultural schools, and domestic science colleges have to be approved by the Ministry but their running is the concern of the school principals.

Commercial schools and technical schools are under the management and control of the Ministry of Commerce. In practice they are supervised by the directors of the inspectorates for commercial schools and for technical schools for craftsmen and industrial operatives, respectively. For each of these two types of schools a school council is set up under the chairmanship of the respective directors and consisting of members chosen from commercial, industrial, building trade and teachers' organizations. The school councils make recommendations on matters submitted to them by the chairmen and may themselves bring up questions.

The trade committees mentioned in a previous section act as consultants to the Ministry of Commerce in all questions concerning apprentice training. An Apprenticeship Council is set up representing employers and employees in commerce, industry and the building trades, which also advise the Ministry of Commerce and other Ministries on matters referred to it by these Ministries. The Council generally works to promote the aims of the Apprentice Act.

Supervision and inspection. Whereas ministry officials deal with the administration proper, educational matters come under: the State Adviser on primary education, the Chief Inspector for *gymnasier* and the Chief Inspector for the middle and *real* schools and preliminary schools. There is also an inspector for each of the manual training subjects taught. All these are civil servants, chosen from among teachers or headmasters who have performed outstanding services in their particular fields. The educational inspection service gives advice to the Ministry and to the schools. The work of individual teachers is supervised by the Chief Inspectors, usually acting through their specialized assistants in the respective subjects. The Chief Inspectors are also responsible for the various external examinations and preside over the committees that prepare the written papers. They have to make statements on matters referred to them by the Ministry, such as the appointment of teachers, curricula, dispensations from regulations concerning teaching and examinations, etc.

Supervision of further education, youth schools, evening schools, junior folk high schools, agricultural courses, correspondence schools, leisure activities, senior folk high schools and agricultural schools is carried out by the State Adviser to the Ministry of Education on matters concerning further education for youth. Folk high schools and agricultural schools are also inspected locally by a supervisor who is a resident in the district and who is appointed by the school and approved by the Ministry. A committee of experts assists the Ministry of Education in matters concerning the domestic science colleges, which are under the supervision of a woman inspector for domestic science. As with the folk high schools, local inspection is carried out by a supervisor appointed by the school.

The inspectorates for commercial schools and technical schools have already been mentioned.

Finance. It is purely a matter of chance which places have had state *gymnasier* established and which places municipal ones. An Act of 1959 divided the cost of establishing and operating these schools between the central and the local governments. In providing that 25 per cent of the cost of establishment be paid by the State and 75 per cent by the municipality concerned, the Act confirms a practice already applied to the more recently opened *gymnasier*. The Act further provides that operating expenses of the *gymnasier* shall be divided so that the State defrays 90 per cent of the cost for pupils in municipal *gymnasier* and the municipalities 10 per cent of the cost in state schools.

The Government subsidizes the operation of municipal middle and *real* schools and preliminary schools to the extent of 85 per cent of teachers' salaries. The grant is made through the county school fund, which serves to distribute government subsidies to local organs, to defray

municipal school expenditures and to make grants for other school purposes. In addition to this subsidy towards teachers' salaries, which is also given to municipal non-examination schools, the Government gives a smaller subsidy specially for municipal examination schools. The Government subsidizes the setting up of municipal schools by granting fixed minor sums towards classrooms, gymnasiums, manual training workshops, domestic science kitchens, libraries, etc.

The remuneration and conditions of service of the permanent teaching staff in state schools are laid down by the Act of 7 June 1958 on salaries, pensions, etc., for government servants. Teachers at municipal schools are remunerated according to an Act of the same date on salaries, etc., for public primary school teachers. Teachers' salaries at the municipal *gymnasier* are the same as those at state schools.

Private middle and *real* schools and *gymnasier* receive considerable grants from the Government. Under two bills passed in 1959, private middle and *real* schools in Copenhagen and private *gymnasier* throughout the country are granted operating subsidies of respectively 66⅔ per cent and 80 per cent of the gross hourly operating cost of public *gymnasier* in the Copenhagen municipalities; and private middle and *real* schools outside Copenhagen are granted 85 per cent of teachers' salaries plus a fixed basic subsidy per school. The grants are paid direct to the heads of the schools. Teachers must receive the same salaries as those in municipal examination schools.

Youth and evening schools receive a subsidy from the State and the county school fund of two-thirds of teachers' salaries, while the municipality or a local organization pays the remaining third. The Further Education Act prescribes a minimum amount for teachers' salaries. Premises, equipment and teaching material are provided by the municipality. The necessary educational supplies are available without charge to the pupils, the cost being met by government subsidy. Besides subsidizing teachers' salaries, the State gives grants towards the running of youth boarding schools, up to 80 per cent of the total cost of operating the school. Considerable state subsidies are also given to junior folk high schools, agricultural courses, folk high schools, agricultural schools, etc., when these schools satisfy the conditions laid down in the Act as regards numbers of pupils, etc. As a rule the teachers at these schools receive the same remuneration as teachers at public primary schools in rural areas.

Commercial schools receive a state subsidy which at present amounts to 48 per cent of total expenditure on teachers' salaries and of expenditure on premises and teaching requisites. Technical schools receive an operating subsidy from the State of 60 per cent of the expenditure entitling to subsidy, in respect of premises, remuneration, teaching requisites, etc., supplemented by an amount to cover the cost of workshop or other particularly costly instruction.

For schools of all types, general and vocational, which are private foundations, the grant-in-aid laws make state building loans obtainable on particularly favourable terms (no amortization of principal, and interest at 4 per cent per annum).

Under the Free Education Act of 11 June 1954, education in municipal and state schools became free for all pupils. This also applies to attendance at youth and evening schools. Private examination schools, private further education establishments and advanced vocational schools charge fees but the State has made considerable allocations available to assist pupils without means to attend many of these types of school. Attendance at commercial and technical schools, as required for apprentices under the Apprentice Act, is paid for by their employers.

In 1952 a Youth Education Fund was established by the Government to provide scholarships or 'study loans' to needy, able young people seeking education at officially approved institutions of higher education and vocational schools. In 1958 the scope of the fund was widened so that it was also possible to give grants for travel expenses, board and lodging for pupils preparing for the *studenter-eksamen* in *gymnasier* or approved tutorial courses that prepare for that examination.

Buildings and equipment. There are detailed rules on building sites, insulation of the school building, size of classrooms (floor area to be at least 1.3 square metres per child), gymnasium with dressing room and baths, size of windows (ratio of glass area to floor area to be at least 1 : 8), lighting, heating and ventilation, and sanitary equipment. The children should also have access to manual training workshops and domestic science kitchens. Larger schools should also have reading rooms, rooms for needlework, singing, and school medical and dental services. Examination schools must have rooms for special subjects, namely, for physics and chemistry, natural history, and where possible for geography.

An institution called the State Institute of Building Research has carried out extensive research work on the most suitable form of construction and equipment for school buildings. This has been very valuable for the extensive school building programme that has been carried out lately.

School welfare services. After some municipalities had voluntarily employed school doctors at their schools for a great number of years, an Act was passed in 1946 providing that every state and municipal school under the Ministry of Education should keep a check on the general health of the children through regular medical examinations, carried out by a school doctor. For private schools the same rules broadly apply. Actual medical treatment is outside the scope of the school doctor. The State grants municipal and private schools a subsidy of 50 per cent of the cost of the school doctors. The legislation contains no provision requiring dental treatment for school children, but many municipalities have voluntarily established school dental services. About two-thirds of all children in school have access to school dental treatment. One half of the cost to the municipality can be refunded by the State.

Many municipalities have introduced free school meals. School meals are not limited to children from needy homes but are usually available only to pupils from the first seven classes. However, children in higher classes may also participate when this is considered desirable by the school doctor.

TYPES OF SECONDARY EDUCATION

The various courses open to primary school leavers who wish to continue their general education have already been outlined and will now be described in more detail. Pupils leaving school are able to supplement their education later through Further Education facilities or may seek admittance to one of the vocational schools.

Besides the help and guidance which teachers would naturally give the pupil and the parents as regards the choice of further education and training, the new school laws of 1958 have introduced vocational guidance for pupils in the seventh-, eighth- and ninth-year classes and in the *realskoler* and *gymnasier*. The Youth School Board sees that all children leaving school are given a booklet informing them how to avail themselves of this education, and that young persons are informed about the plans and times for the various youth school courses, etc., in the municipality. Youths seeking apprenticeships are guided by psychological tests, the results of which show whether they are suited for a particular occupation.

The organization of the school year will be dealt with separately in the sections on the various types of schools.

General secondary schools

It was mentioned above that the organization of the general secondary schools properly so called was being progressively modified. The old and the new provisions will now be discussed in greater detail, and some explanation given of the reasons for the change. Under the system based on the Secondary Education Act of 1903 and the Public Education Act of 1937, public primary education in towns consisted as a rule of a 4- or 5-year junior school, followed by a 4-year examination middle school alongside a 3- or 4-year non-examination middle school. Rural primary schools generally consisted of as many classes within the 7 years of compulsory schooling as were suited to the number of children, but a *realskole* section could not be formed at such a school. It was only possible to join on to the seventh-year class a course, lasting 2 or 3 years, to prepare pupils for the general preliminary examination; this form of education and examination could only be coped with by very able pupils. After the fifth year in school, pupils from both town and country could take an entrance test admitting them to urban middle schools. On the results of this test, which originally included all subjects but which became limited later in many places to a test in Danish and arithmetic, the pupils were allocated to the examination middle school or to the non-examination middle school. The examination middle school was concluded with a leaving test, the middle school examination, after which the pupils could either enter the *realklasse* and take the *realeksamen* or go to the *gymnasie* section and take the *studentereksamen* (matriculation). Pupils from the non-examination middle school left it without any examination, but they could obtain a statement from the school on their application, behaviour, etc.

Enrolments in the examination middle school, however, increased out of proportion to the enrolments in the non-examination middle school. This development has had certain unfavourable consequences, one of them being that a considerable number of pupils drop out by the end of the compulsory attendance period at the age of 14, because they have not been able to keep up with the others. At the same time the senior classes in the non-examination section have been regarded as inferior to those in the examination section, and bright pupils from the former have found it difficult to compete with pupils from the examination school when applying for jobs. The large number of pupils leaving school at the end of compulsory school age miss the rounding off of their education which should have been obtained in the senior classes.

The object aimed at in devising a new school structure was therefore to arrive at a system that would create a balance between the two sections, the examination middle school and the non-examination school, and to make it possible for country children to receive the same examination schooling as town children. It was also desired to abolish the test for children in their fifth year at school, it being regarded as unfortunate that such a test for 11 or 12-year-olds should determine their future so decisively. Finally a system was needed which could give a natural rounding off to the curriculum at the time when compulsory school attendance ceases.
